During Hellenistic and Roman times gems were used in all manner of jewellery, especially by women. Even engraved gems were sometimes simply used decoratively in brooches and rings, especially in the case of cameos, gems carved in relief. The best were works of art, cut in the workshops of Dioscurides and his contemporaries, though others were mass-produced, often love-tokens given by men to their girlfriends. Of especial interest here are those of the 2nd- or 3rd-century AD carved with Greek mottoes, found not only in Greek lands but as far away as Roman Britain.

Byzantine practice marked a break from earlier tradition. The double-sided lead sealing made with the *bulloterion* was more formal in appearance, generally incorporating a religious text as invocation, a portrait of Christ if the seal was imperial, or of the Virgin for the patriarch, while other important people might use a saint or a monogram. Gems were of course still

very much admired but would now normally be worn as jewellery.

Although the Byzantine *bulloterion* was sometimes used in western Europe, notably for papal seals, it was normal in the Middle Ages to use a metal stamp or a finger ring engraved in intaglio, sometimes incorporating an ancient gem or a contemporary copy of it. The ancient Greek practice thus had a tenuous continuity into modern times. From the Renaissance, princely patrons such as Isabella d'Este (1474–1539) and later others such as Thomas Howard, Earl of Arundel (1585–1646), collected classical gems as objets d'art. This stimulated artists to emulate their Greek and Roman predecessors. Often completely new subjects were engraved, based on ancient or contemporary statues or paintings, as in the case of the 18th-century English engravers Nathaniel Marchant (1739–1816) and Edward Burch (1730–1814). It was thus by no means unusual for any European of the period of the Enlightenment to seal a letter with the image of Homer or Socrates.

Gender

In this essay, the term "gender" is to be understood as the social and cultural, as opposed to biological, identification of a person's sex, and the distinctions between the sexes.

Though a social construction, gender nevertheless has its ideological roots in biological differences, real or imagined, between the sexes. This is presented most clearly by the 5th-century-BC doctor Hippocrates, who wrote in his *Diseases of Women* (trans. A.E. Hanson, quoted in Halperin):

> I say that a woman's flesh is more sponge-like and softer than a man's: since this is so, the woman's body draws moisture both with more speed and in greater quantity from the belly than does the flesh of a man ... And when the body of a woman – whose flesh is soft – happens to be full of blood and that blood does not go off from her body, a pain occurs, whenever her flesh is full and becomes heated. A woman has warmer blood and therefore she is warmer than a man. Because a man has more solid flesh than a woman, he is never so totally overfilled with blood that pain results if some of his blood does not exit each month. He draws whatever quantity of blood is necessary for his body's nourishment ...

Women are therefore bound to bleed, notably at liminal points of life: menstruation, defloration, and parturition; it is an essential aspect of the prime female role as giver of life. By contrast, it is the man's duty to bleed in warfare, which was understood by the ancient Greeks as the male counterpart to female parturition. Thus Euripides' Medea proclaims that she would prefer to face battle three times rather than give birth once (*Medea*, 250ff.), and the laws of Lycurgus allow marked burials only for men who died in battle and women who died in childbirth (Plutarch, *Life of Lycurgus*).

This dichotomy of the "soft, weak" female and the "strong" male pervades all aspects of the Greek understanding of gender distinctions. Since the female is weak in will and body, excess and temptation have received feminine attributes. In ancient Greece feminine deities personified strife (Eris) and madness (Lyssa), while in the Byzantine era sins acquired feminine personifications (Neophytos Enkleistos). Nevertheless, this weakness also counteracts the high potential for destruction and disruption, and the feminine is seen to be essentially *passive*, unable to exert active control over the self and often considered to be childlike.

By contrast, the male is understood to be strong in body and mind and is essentially *active* in character. As the strong body makes men fit for warfare, strength of mind gives them the potential for self-restraint, in Greek *sophrosyne*, or temperance. Thus the male is expected to control his appetites for food, drink, and sex along with overweening pride and anything else considered to be excessive (Aeschines, *Against Timarchus*). The male is in active control, stable and competent, while the female is passive but dangerous. This conception of male and female genders has changed little if at all since ancient times.

While the ideology of the strong, active male and the weak, passive female remains constant in Greek culture, there are various inversions of these roles, when men become "as women" and vice versa. In early Greece gender ambiguity is represented by Dionysus, god of wine, madness, and liminality. In the *Bacchae* he is described as fair-skinned, long-haired, and luxurious, and since he is feminine he also causes the youth Pentheus to adopt transvestitism. From the 4th century BC vase painters show Dionysus as beardless. Even greater gender ambiguity occurs with Heracles. While ultimately masculine in his superior strength, Heracles is forced into the feminine role throughout his career. On one occasion he must serve the Lydian queen Omphale, wearing her clothes and spinning thread at her feet, while she bears his cloak and club. In *Trachiniae* (1070ff.) suffering in his death, Heracles proclaims

himself turned into a woman. As there are feminine men, so too are there masculine women in the Greek tradition, notably the maenads and Amazons, both of whom represent inversions of the "natural" order of society and civilization in the ancient Greek arts.

Beginning in the Byzantine era eunuchs also upset the engendered order. Contemporary views varied on the extent to which eunuchs represented a "third sex". The secular opinion was that eunuchs were neither male nor female, but other, while Theophylaktos of Ohrid (12th century), providing Church commentary, argued that they were "neither a third sex nor a third gender; they are simply men" (S. F. Tougher, in James, 1997, p.169). Nevertheless, physical and sexual differences were recognized in eunuchs; Theophylaktos himself noted that sexual purity was their inherent benefit (ibid., p.175); they had feminine voices, glossy skin, and corpulent physiques (Hopkins, 1978, pp.193–94); and the 10th-century Arab historian al-Masudi mentioned that their armpits did not smell (Masudi, 1989, pp.345–46).

Male homosexuality in ancient and modern Greece presents its own subversion of masculine gender. In ancient Greece the man was expected to be the *erastes*, the active lover. Only the female should be able to enjoy sex passively (*eromenos*), and the male who did so was given the derogatory epithet *kinaidos*. In modern Greece male homosexuality is regarded as the union of an active, extra-masculine male and a passive, feminine one known as the *poushtis* (Loizos and Paptaxiarchis, 1991, p.227). The latter is often regarded as subhuman, being of weak moral character and without dignity (ibid., pp.227–28). A lesser, although more commonly heard, insult of the male through likening to the female is the term *malaka*, meaning "soft". It carries inherently feminine overtones, and ranges in insult from casting aspersions on the masculinity of the term's recipient to verbally placing the recipient in the role of the *poushtis*. As in most modern, Western cultures, there is no corresponding insult likening the female to the male.

In all periods of Greek history the house interior is feminine space, while the outdoors, the city or farm, is the realm of the man. The white paint used to render females in Bronze Age and classical art in contrast to the red or black pigments used to colour men has mostly been attributed to this dichotomy. In modern Greece the house is still the proper domain of the woman (A. M. Iossifides, in Loizos and Papataxiarchis, 1991, p.141), and the respectability of (unmarried) females is often dependent on claims of "never leaving the house". By contrast men are expected to remain outdoors (J. K. Cowan, in Loizos and Papataxiarchis, 1991, pp.187ff.), either working in the fields or the city, or relaxing in male company at the *kafeneion* (one humorous aspect of modern Greek village life is the social impropriety of men going home during the day; on slow days they have little choice but to remain at the *kafeneion*).

While interior space is feminine and the civilized outdoors masculine, wild, uncultivated territories are seen as feminine. In the pagan tradition this area is sacred to Artemis, and it is to these regions that the maenads flee when possessed (Euripides, *Bacchae*). Unfortunately, little such territory remains in modern Greece.

Gennadios II Scholarios *c.*1405–*c.*1472

Scholar and Patriarch of Constantinople

Baptized as George, with the (maternal?) family name of Kourtesis, he was born in Constantinople *c.*1405. His parents, of Thessalian origins, had relocated in the capital. Little is known of his early life, but he clearly received the best education that the intellectual life of Constantinople could allow. His teachers included the philosopher-humanist John Chortasmenos, and the theologians Joseph Bryennios and Mark Eugenikos.

He developed early a love for philosophy and theology, and for their interrelationships. Impatient with the Platonism dominating Byzantine intellectual life – and represented by the maverick scholar George Gemistos Plethon – he became an ardent Aristotelian. Likewise disillusioned with what he considered the shallow level of Byzantine philosophical and theological scholarship, he learned Latin and studied the commentaries of Averroes and Avicenna (in Latin) as well as the works of Latin theologians, especially Thomas Aquinas. Particularly sympathetic to the Scholastic harmonization of Aristotle's thought with Christian theology, he translated some of Aquinas's writings, respecting Thomistic thought even into his own later years of hostility to Church union with the Latins.

George opened his own school of grammar, philosophy, and logic. Accused of being a "Latinizer" – an irony in view of his later ecclesiastical stance – he defended himself with the arguments that Latin philosophy had simply outstripped what the Byzantines knew, and that admiring the learning of the Latins did not necessarily mean accepting their religious doctrines or compromising his firmly held Orthodox beliefs.

George's intellectual activities won him the admiration and friendship of the emperor John VIII Palaiologos, who appointed him to significant court and judicial offices. From a post as the emperor's secretary he took the title of "Scholarios" which became firmly affixed to his name thereafter. His advice was understandably sought by the emperor as plans were made

for a council in the West to consider the union of the Greek and Latin Churches, which at this point he favoured.

He served as an unofficial member of the Byzantine delegation to the union council which, opening in Ferrara in the spring of 1438, was transferred to Florence the following year. He was initially more in tune with the pro-unionist and fellow-student of Chortasmenos, Bessarion of Trebizond, than with his former teacher Mark Eugenikos, the principal opponent of union. In April 1439 he joined Bessarion in pleading with the Greek delegation to reach agreement with the Latins and thus secure aid against the Turks, arguing, in the process, that Latin learning and theological dialectic were now superior to Byzantine skills in these realms and had shown how seeming contradictions in Patristic texts could be reconciled. He attempted unsuccessfully to contribute a compromise position statement of his own, and he expressed a clear acceptance of the principles of the union.

Circumstances prompted his departure from the council before its proclamation of the union, to which he was thus not a formal signatory. Recognition of the hostility towards the union of Byzantine public opinion may already have begun to undermine his affirmative position, while he soon recognized that the hoped-for military aid from the West for which the union had been bargained would be of no consequence. When he returned to Constantinople, Scholarios remained officially a pro-unionist, or at least a favourably disposed neutral, if only out of respect for his master the emperor, on whom his career so much depended. But he became the target of Mark Eugenikos, the outspoken champion of anti-unionism. Apparently by the time of the latter's death (June 1445), Scholarios was won over to the opposition. Still observing caution, but at growing cost to his official status, he began to emerge as the chief exponent of rejecting compromise with Latin doctrines.

John VIII's death (October 1448) removed any remaining restraints. Scholarios joined those who attempted to withhold recognition from the new emperor, Constantine IX, unless he renounced the union. With his old life and livelihood gone, and either expelled or resigning from his remaining court positions, Scholarios became a monk, taking the name of Gennadios, by which he would henceforth be known. He began an active campaign of writing and preaching the cause of Orthodoxy and its preservation from Latin doctrinal perversions, supported by many of the clergy. When the threat of Turkish attack on Constantinople rose and his former schoolmate Isidore of Kiev arrived as a Roman cardinal and papal legate, Gennadios circulated his final denunciations of the union. After its belated proclamation in Hagia Sophia (December 1452), Gennadios isolated himself in his cell at the Pantokrator Monastery, taking no part in the ordeal of the city's beleaguerment until the following spring.

When Constantinople fell on 29 May 1453, Gennadios was captured and carried off to Adrianople among the enslaved prisoners. In already established Ottoman tradition, Mehmet the Conqueror appreciated the value of the Orthodox Church as a focus of Christian identity and, consequently, as an agency through which he might rule its faithful. Recognized by the sultan as a logical figure to reunite the Christian population, Gennadios was brought back to Constantinople and allowed to reconstitute his monastery. Meanwhile, Gennadios made a great impression upon the sultan, and a relationship of mutual respect and even friendship developed between them. Mehmet realized that, with his anti-union leadership and hostility to Rome, Gennadios would be a reliable leader of the Christian *millet* (communities) firmly under Turkish rule. They seem, by June 1453, to have worked out an understanding as to the revival and operation of the Greek Patriarchate of Constantinople. The last Byzantine patriarch had fled the city before its fall, so that new election procedures could be observed and, the following January, Gennadios could be properly and canonically enthroned in that office. He was at first headquartered in the church of the Holy Apostles, from which, however, he soon transferred his seat to the smaller (and safer) church of the Pammakaristos.

The Byzantine Patriarchate had been an agency of a Christian imperial state; it now was easily transformed into a component of an Islamic imperial state. Gennadios was assured, however, that his position, and that of the Church, were to be fully respected. Indeed, the tolerant and intellectually broad-minded sultan enjoyed at least three discussions of religious ideas with him. Gennadios may even have had hopes of converting the sultan when the latter commissioned him to write a concise exposition of Christian belief for translation into Turkish. On the other hand, the new patriarch was sensitive to internal challenges: believing the neo-pagan ideas of old Plethon to be dangerous, Gennadios went so far as to destroy most of the sole manuscript of Plethon's treatise, *On the Laws*. Nevertheless, Gennadios confronted the social strains suffered by his flock with a pragmatic flexibility (*oikonomia*) in interpreting canonical regulations that provoked much criticism from some of his clergy.

Wearied by his uncongenial burdens, after about two years Gennadios was allowed to retire from his office to monastic refuge. But shameful squabbles under his immediate successors prompted the sultan to recall him to the Patriarchate in 1463. He is said to have fled from his tasks after a few months, but he was recalled again for a final term of service (1464–65) before his definitive release. He spent his remaining years in the Monastery of the Prodromos near Serres (in Macedonia), resuming his devotion to theological writing and Thomistic scholarship. The date of his death is uncertain but may have been as late as 1472.

JOHN W. BARKER

Biography

Born in Constantinople *c.*1405, George (as he was baptized) was a pupil of such distinguished scholars as John Chortasmenos, Joseph Bryennios, and Mark Eugenikos. He taught logic and physics at his own school and studied the works of Averroes, Avicenna, and Aquinas. He accompanied the emperor to the council of Ferrara/Florence in 1438–39 but later abandoned his pro-unionist stance. After the fall of Constantinople sultan Mehmet II appointed him the first patriarch under Ottoman rule. He died *c.*1472.

Genoese

Genoa is a port on the gulf of Genoa in Liguria, some 120 km south of Milan in northwest Italy. It was first mentioned as a *municipium* in the 3rd century BC and had a bishop of its own by the mid-5th century AD. From 958 it was a free city ruled by its bishop. During the 9th and 10th centuries Genoa and the Ligurian coast were subject to Muslim raids from Sicily and Spain. In 1016–17, in alliance with Pisa, Genoa prevented the Muslim conquest of Sardinia and in 1087 raided Mahdia, to the south of Tunis. As part of the peace negotiations with the Muslims the Genoese secured the right to trade along the Tunisian coast. After 1090 and the conquest of Sicily by the Normans, Genoese trade was extended to southern Italy. The Genoese also traded with the Levant. In 1063 Ingulf, abbot of Croyland in Lincolnshire, returned from pilgrimage in a Genoese ship he boarded in Jaffa, and in 1094 or 1095 on pilgrimage to the Holy Land Godfrey of Bouillon sailed out and back in a Genoese ship called *La Pomella*. In 1097 a squadron of 12 Genoese ships took part in the First Crusade and helped capture the city of Antioch. As a reward Genoese merchants were granted a *fondaco* based around the church of St John and 30 neighbouring houses by Bohemond, the new ruler of the city.

Behind the Amalfitans (950?), Pisans (1111), and Venetians (1092), the Genoese did not conclude their first commercial treaty with the Byzantines until 1155. In the following year, partly to wean the Genoese from too close a commercial alliance with Byzantium, William I of Sicily granted them favourable trade concessions in the wheat and cotton trade of Norman Sicily. Nevertheless, the Venetians saw the Genoese as their main rival in Constantinopolitan trade, and in 1162 and again in 1171 attacked the new Genoese quarter. The Genoese inhabitants of Constantinople helped defend the city against the army of the Fourth Crusade, but its success placed trade with Constantinople firmly in Venetian hands, to the detriment of Genoese merchants who sought trade links with the Greeks of Nicaea. In 1261 by the Treaty of Nymphaeum the Genoese gave their support to Michael VIII Palaiologos's successful attempt to recapture Constantinople; in return in 1267 Genoese merchants received very favourable concessions together with a commercial base in Pera (Galata), from where an extensive Black Sea trade was built up.

The 14th century marked the apogee of Genoa's preeminence in Aegean and Black Sea trade. In 1275 Manuale Zaccaria had been granted a monopoly of the alum mines around Phocaea (modern Foggia) in northwest Turkey. Alum was the principal fixing agent used in the west for the dyeing of cloth, and the mineral from Phocaea was the best available outside the Black Sea area. In 1304 the monopoly was extended to Genoese merchants in general, though not before the Zaccaria family had amassed a fortune which elevated it to the ranks of the super-rich. In the same year the Genoese seized the island of Chios, both to protect their investments in Phocaea and to preserve the mastic gardens on the island from Turkish attacks. Mastic was the favoured toothpaste of the wealthy in the Middle Ages and Chios its only known source. The island reverted to Byzantine rule in 1329 but in 1346 was seized by a Genoese adventurer, Simone Vignoso. The Genoese government, unable to repay the cost of this expedition, passed the administration of the island and the exploitation of its resources to a company (*mahonna*) made up of those who had financed the expedition. The island remained in Genoese hands until 1566 and the *mahonna* became the earliest example of a chartered company administering a colonial possession. In November 1354, in return for helping John V Palaiologos to enter Constantinople, the Genoese family of Gattalusi were rewarded with the island of Lesbos and an imperial marriage with the emperor's sister Irene. The family established a ruling dynasty based on Lesbos which lasted till 1462. In the same period the Genoese retained their share of Levantine trade in the face of aggressive Venetian action to regain its own share of the market. Four major naval wars (1258–70, 1294–99, 1350–51, and 1375–81) resulted. With the capture of Constantinople by sultan Mehmet II in 1453 the Genoese rulers and merchants in Chios, Kaffa, Lesbos, and Pera sent embassies to offer their congratulations and to negotiate tribute payments to their new overlord. Thereafter the Genoese lost out to the expanding Ottoman power, which took Pera in 1453, Lesbos in 1462, Kaffa in 1475, and the island of Chios, the last Genoese possession in the Levant, in 1566.

Byzantine/Greek artistic influences were not as evident in Genoa as they were in Venice. They are, however, evident in two major schemes: the frescos in the cathedral of St Lawrence in Genoa painted around 1310 may have been the work of a Byzantine, but this together with a textile depicting the life of St Lawrence sent to Genoa by Michael VIII Palaiologos.

PETER LOCK

Summary

A relative latecomer to the Byzantine world, the Italian city-state of Genoa concluded its first treaty with Constantinople in 1155. The Genoese quickly became the Venetians' main trading rivals. The Genoese had a monopoly of the alum mines around Phocaea: they also ruled Chios from 1304 to 1566 (with a break in 1329–46) and Lesbos from 1354 to 1462.

Geography

Although the Greeks were the creators of the science of geography and made considerable advances in mathematical and descriptive geography, they were hampered by the lack of good technical appliances and therefore could not obtain technical accuracy. Only a fraction of the world was actually known to them, and what was unknown was the subject of a priori deduction and fanciful speculation. With the exception of mathematics and astronomy, Greek geography did not as a rule rely on other sciences as does geography today.

A considerable appreciation of topography, world order, and theory is displayed in the various Homeric descriptions, some of which are quite elaborate. The catalogue of ships in book 2 of the *Iliad* is a systematic evocation of the homeland of the Greeks. Both Homer and Hesiod conceived the earth as a round land mass surrounded by Ocean and symmetrically vaulted by heaven above and Tartarus below.

It was among the Ionians of Asia Minor that Greek geographical enquiry and writing originated, and their geographical horizons were enlarged by the expansion of their commerce and the colonization movement. In choosing names for their new settlements they repeated place names from their homeland, a habit of thinking which reflects a geographical sophistication. Not only is this practice paralleled from other parts of the world and other ages, but the practice persisted among the Greeks themselves down to Hellenistic, Roman, and even modern times.

The first recorded attempt at drawing a map of the world is that of Anaximander of Miletus (6th century BC). This map probably represented the world as a circular land mass divided into two portions, Asia and "Europe", surrounded by Ocean as Homer described it. The map was corrected and enlarged by Hecataeus (530–490 BC) who also wrote a commentary on it (including descriptions of towns and peoples as well as geographical features), of which some fragments are preserved by Herodotus. Herodotus (traditionally 484–425 BC), the "father of history", carefully recorded his personal observations made during many years of extensive travel, thus combining the geographical and ethnographical perspectives. Following his example, almost all ancient historians regularly included geographical descriptions in their works, and many of them appreciated, though perhaps not adequately by modern standards, the impact of geography on historical events. Ephorus (*c.*405–330 BC) attempted ethnography and historical geography and devoted entire books to descriptive geography, while Timaeus (*c.*350–260 BC) dealt largely with the general geography of western Europe.

Meanwhile, the shape and nature of the earth itself was engaging the attention of the early Greek philosophers. Of the Milesians, Thales (*c.*625–547 BC) declared it to be like a log floating on water, Anaximander that it was cylindrical and that it remained steady due to its central position in respect to other heavenly bodies, Anaximenes (*c.*380–320 BC) that it was like a leaf floating in the air. By insisting that the earth had no limit below and that the air had none above, Xenophanes (*c.*570–478 BC) got rid of both Uranus and Tartarus. The sphericity of the earth was asserted by the Pythagoreans, referred to for the first time in extant literature by Plato (in the *Phaedo*), and proved by Aristotle and Eudoxus of Cnidus (*c.*400–347 BC). The last mentioned is also responsible for the division of the globe into five zones: one of torrid and two each of frigid and temperate climate. Heraclides of Pontus (388–315 BC) declared that the earth revolved round its axis, and Aristarchus of Samos (330–260 BC) believed that it might also be revolving round the sun (prior to this, the Pythagorean Philolaus had taught that the earth, together with the planets, revolved round a central fire).

The earliest surviving work of a purely geographical nature is a description of the Mediterranean coast, the so-called *Periplus of Scylax* (named, doubtless, after Scylax whom Darius sent to explore the Indus), in reality a work of the early 4th century BC. About 330 BC Pytheas of Massilia made his voyage of exploration towards the northwest as far as the northern end of the British Isles and the coasts of Germany.

At about the same time, the eastern campaigns of Alexander the Great opened to Greek research the whole of Asia as far as India, with prospects of further expansion. The work of his companions and followers served, more than anything, to establish a link between formal geography and political dominion. Moreover, through the development in their hands of the ethnographical tradition, these writers gave to geography an analytical content which, while relying on the techniques of description and cataloguing, outlasted them. Thus Nearchus' report on his voyage from the Indus received visual form in a new map by Aristotle's pupil Dicaearchus of Messana (*c.* 320 BC). He was the first writer to treat physical geography in a scientific manner. Though his estimate of the earth's circumference (40,000 miles) was exaggerated, he rightly assumed the existence of a southern hemisphere. His map remained the standard of its kind for a long time.

The southern and eastern parts of India were opened up even further under Alexander's successors, as a result of Seleucid military expeditions and the trips of ambassadors such as Megasthenes. Unlike Ctesias of Cnidus (*c.*400 BC) whose *Indica* has been criticized as being overloaded with fable, Megasthenes has been commended (though not without debate) for giving a good description of the Ganges valley, of which he had personal knowledge. The Arabian and East African coasts became better known as a result of the commercial expeditions of the Ptolemies, and this improved knowledge is reflected in Agatharchides' partially extant description of the Red Sea coast (*c.*120 BC) and in the geographical chapters of Diodorus Siculus (*c.*100–20 BC).

It was Eratosthenes of Cyrene (*c.*285–200 BC) who arranged into a truly scientific system the mass of geographical material

collected up to his time. He rejected the Homeric tradition and insisted on a clear distinction between fictitious wonder-descriptions and the recording of scientific fact. He created a new genre by blending mathematical and descriptive geography. His achievements in mathematics and the physical sciences on the one hand and history and philology on the other equipped him ideally for his task. He was the first to attempt to estimate the earth's circumference by a measurement of degrees carried out over a space of 15 degrees of latitude, but the imperfections of his method caused him to arrive at an exaggerated estimate (by 15 per cent or less) of 25,000 geographical miles. But the estimate which came to be accepted for many centuries to come was that of Posidonius of Apamea (*c.*90 BC) who based his calculation on the measurement of the shortest distance from Alexandria to Rhodes, and arrived at a figure of 18,000 geographical miles.

The true founder of mathematical geography was Hipparchus of Nicaea (*c.*140 BC), for he applied geometrical length and breadth to determine the position of places on the earth's surface. He also replaced the then current (Eratosthenean) rectangular and equidistant projection of parallels and meridians with a projection approximating to modern usage. He represented the parallels by segments of a circle, and the meridians by straight lines or curves in keeping with the portion of surface to be represented, drawn at distances corresponding to the actual distances on the surface of the globe.

The most important surviving Greek work on descriptive geography and ethnology is the 17-book treatise of Strabo published around AD 20. It covers topography as well as physical, political, historical, and (with less enthusiasm) mathematical geography. His object was the edification of political and military leaders. Roman conquests enabled him (as they enabled Polybius and Posidonius) to give a more accurate description of the West than his predecessors. The first two books present a wide-ranging discussion of the aims and methods of geography and review earlier writings on the subject. The remainder is devoted to regional geography. The vanished writings of many of his predecessors are known to us mainly through his criticisms.

The geographical contribution of Claudius Ptolemy (mid-2nd century AD) was the concept of the tabulation of latitude and longitude of places, which could give precision to locations. Its defects are due chiefly to the inaccuracies in his data and his preference for a priori principles over data available from recent reports (which must have included works such as the anonymous *Periplus of the Erythraean Sea*, a work probably dating from the second half of the 1st century AD and preserved, with other minor geographical works such as the epitome of Strabo, in a 9th-century Heidelberg manuscript). Though most of Ptolemy's geographical data were not actually determined by astronomical observation, he expressed them systematically in reference to curved lines of latitude measured northwards from the equator and curved meridians measured eastwards from the Canary Islands. The special topographical features of Greece were served by Pausanias' *Guide to Greece*, while the didactic geographical hexameter poem of Dionysius Periegetes (2nd century AD) acquired so much popularity down the ages that it was translated into Latin by both Avienus and Priscian, paraphrased by Nicephorus and an anonymous writer, and was commented on by Eustathios, the 12th-century bishop of Thessalonica.

Greek geographical writings after Ptolemy largely consist of compilations and extracts, such as the *Periplus of the Outer Sea* by Marcian of Heraclea (*c.*AD 400) and the *Anonymi Geographi Expositio Compendiaria* attributed to Agathemerus. Both these works were printed by C. Müller in the first volume of his *Geographi Graeci Minores* (1855). Towards the end of the 6th century Stephanos of Byzantium compiled a dictionary known as the *Ethnica* which has preserved a great quantity of geographical information from earlier writers now lost, and which was in its turn utilized by the emperor Constantine VII Porphyrogenitos in his *De Administrando Imperio* and *De Thematibus* which include historical and ethnographic data. Stephanos's main sources were Strabo and Pausanias. Cosmas Indicopleustes, an Egyptian merchant turned monk, wrote the 12-book *Topographia Christiana* in which he made a vehement attempt to disprove the pagan theory of the earth's sphericity, maintaining that the shape of the world was the same as that of the tabernacle which Moses built to house the Covenant.

Interest in descriptive geography, which had been fashionable in the late Roman period, dwindled after the 6th century, but was revived in the 9th century beginning with Epiphanios Hagiopolites, and with the resurgence of travel literature from the 11th century onwards. The history of Gregoras, covering the period 1204–1359, included a long account of his friend Agathangelos whose letters described his alleged journeys around the Mediterranean during 20 years. He was followed in the subsequent centuries by John Phokas, Andrew Libadenos, and Laskaris Kananos. Within this category of descriptive geography can also be included narrative accounts of ambassadors to foreign lands, such as Priskos of Panium and Nonnosus in the late Roman period, and Constantine Manasses, Nicholas Mesarites, and Theodore Metochites in the 12th–14th centuries.

Although Byzantine scholars, like their Greek predecessors, held various views regarding the shape of the earth (ranging from the domed cube of Cosmas Indicopleustes to the globe of Photios), the centre of their *oikoumene* (world) was the Mediterranean. This was surrounded by the three continents – Asia, Europe, and Libya – while the Ocean surrounded all of them. Britain, China, and Black Africa lay at the extremes of the earth and were generally presented in legendary form. India was either identified with Ethiopia or with the country round the Phison of scripture (identified with either the Ganges or the Indus). The Phison was one of four major rivers which originated in the terrestrial Paradise, the easternmost country of the world.

Byzantine geographical perceptions, like those of the ancient Greeks, were limited by various factors: (1) the need to reconcile observations and empirical findings with preconceived notions based on scripture; (2) the uncritical acceptance of bookish information as true, without reference to current conditions; and (3) the strong impact of folklore on geography, which led to reliable information being often blended with fantastic notions concerning foreign lands and peoples.

Geology

Our knowledge of the geological history of the Aegean region starts in earnest 200 million years ago. At that time the North Atlantic Ocean did not exist and both Africa (more correctly Gondwanaland, or Africa plus other continents) and Eurasia (Europe and Asia) were united with the North American continent to form a supercontinent named Pangea. Between the future continents of Africa and Eurasia there was a wedge-shaped ocean, named Tethys (after the daughter of the earth goddess Gaia), which opened out to the east, where it joined the other oceans. The southern part of Tethys was a wide, shallow tropical sea where limestone was being deposited, rather similar to the Bahama banks today. Much of the grey limestone seen today in Greece formed at this time. Low islands on this platform were later to form parts of the mountains of Macedonia, Thrace, and southwestern Turkey. The northern part of Tethys was a deep ocean basin that abutted mountains in southern Eurasia. This state of affairs changed when the North Atlantic Ocean began to form about 190 million years ago.

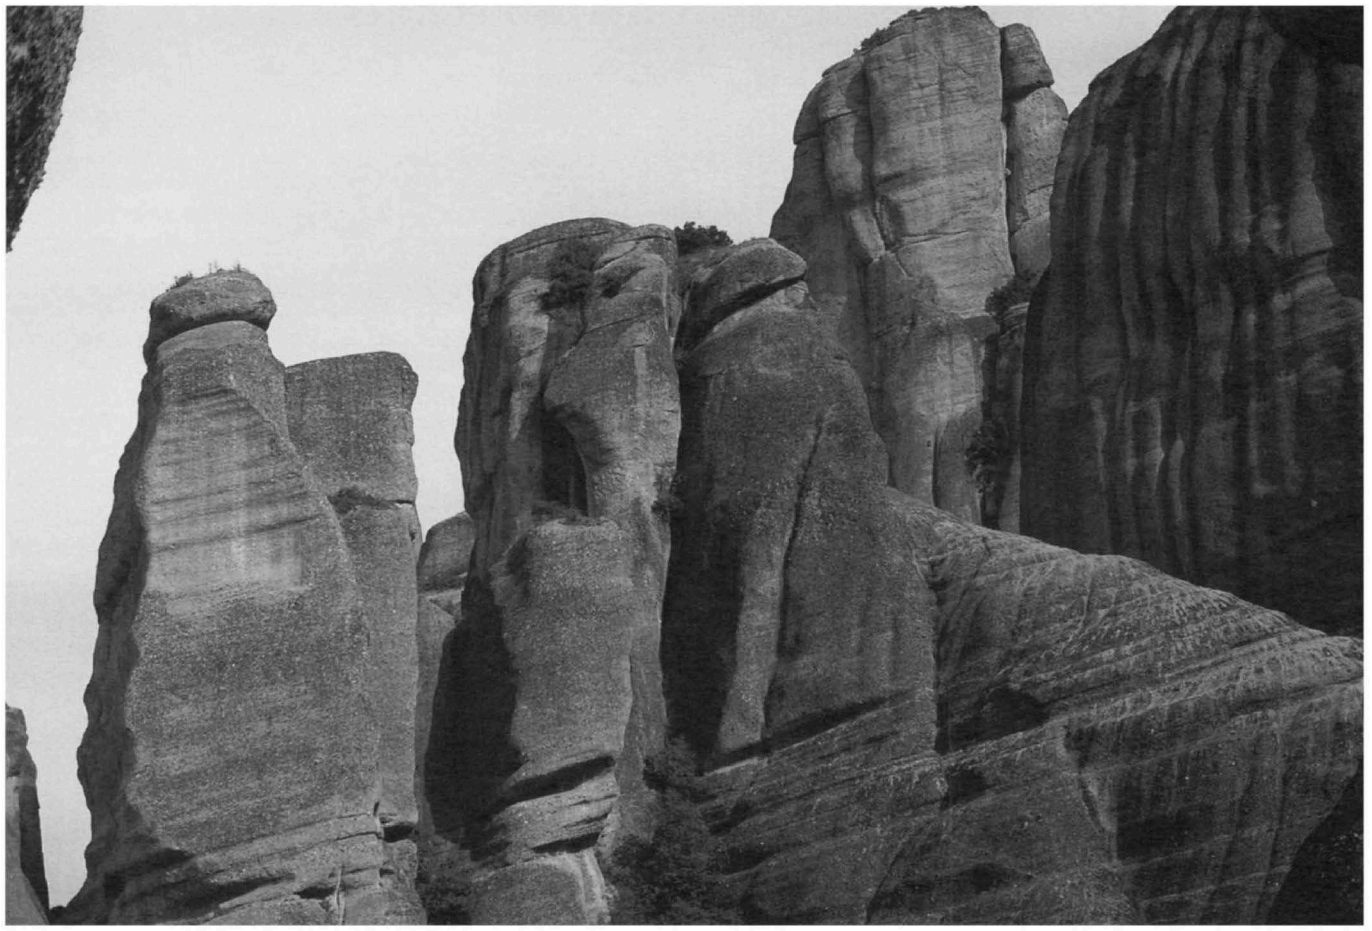
The Atlantic Ocean started to open from the south and a great tear extended northwards. Africa had to rotate anti-clockwise to accommodate the new ocean and the Tethys Ocean started to close up. At the same time, between the wide platform where the limestone was forming and the core of the African continent, a new ocean was opening up, later to become the Mediterranean Sea. These two processes combined to force the limestone platform, with its islands and troughs, northwards towards Eurasia. The deep ocean floor could bend and descend into the deeper parts of the interior of the earth, but the islands and the platforms were too light to go down. Instead they were piled against Eurasia to form chains of mountains. The overall convergence between Africa and Eurasia slowed down after the Arabian peninsula hit Eurasia, but continued expansion of parts of the Mediterranean sea floor continued to force parts of the crust northwards, raising up further mountain ranges. This overall convergence continues today, which is why the Aegean region is so mountainous.

Within the overall Mediterranean context of convergence and compression there are regions where crustal stretching was and is important, such as parts of the Aegean. During crustal stretching the surface of the earth cracks along faults. Parts of the crust descend to form tectonic valleys called grabens (as opposed to erosional valleys formed by rivers) which can also extend under the sea, the intervening blocks remaining as mountains, peninsulas, and islands (horsts). Expansion was directly north–south in Asia Minor, giving major east–west grabens now occupied by rivers such as the Gediz and Büyük Menderes in Turkey. In the Peloponnese and southern Greece expansion produced northwest–southeast grabens, such as the Gulf of Corinth and the Euboean straits. In between these areas stretching was more complex, producing a series of isolated blocks, the Cyclades.

Mention should be made of an unusual event that occurred about six million years ago: the Mediterranean sea almost completely dried up. This happened when tectonic forces closed up the Straits of Gibraltar. Rivers flowing into the basin, principally from the Black Sea, were insufficient to maintain sea-level and the sea dried out, except for a few saline lakes resembling the modern Dead Sea. There may even have been a salty waterfall at Gibraltar, also feeding the lakes. Evaporation of water from the lakes produced deposits of gypsum (alabaster) and other minerals, seen today in Crete and elsewhere.

The climate of the last 1.6 million years has been marked by dramatic fluctuations. Within this period, loosely called the Ice Age, the climate has been generally cool, with warmer conditions typically lasting for about 10,000 years every 100,000 years. During the last glacial period, about 130,000 to 10,000 years ago, the climate of the Aegean was moist and cool. There were glaciers on the highest mountains of the Greek and Turkish mainlands and the island of Crete. Sea level was considerably lower that it is today, by about 120 m, and hence the river-beds were steeper resulting in more rapid erosion. Mountains were deeply incised, and broad, flat valleys were developed. The climate was coldest about 20,000 years ago. Warming began rapidly about 10,000 years ago, but by 8000 years ago the climate was more stable. Since then variation has been less extreme, especially during the last 4000 years.

Global climatic warming melted the glaciers and sea-level rose, stabilizing close to its present level about 6000 years ago. The sea invaded estuaries, drowning many Palaeolithic sites on the old, fertile river plains. The deep, protected bays that formed were useful harbours in antiquity, but many had a short life (e.g. Miletus and Ephesus). Sediments washed down by the rivers were deposited in the bays, commonly filling them almost completely (e.g. Thermopylae and the gulf of Malia). Agriculture increased erosion and hence aided this process. It should be noted that earthquakes can also produce local



Geology: the lofty pillars of the Meteora in central Greece, most of which are topped by monasteries. Made of conglomerates, the cliffs acquired their remarkable shapes by weathering and erosion

changes in sea-level that are superimposed on the global sea-level rise (e.g. Phalasarna and Western Crete).

Geological history is recorded by rocks – sedimentary, metamorphic, and igneous. Sedimentary rocks form on the surface by the accumulation of rock fragments (e.g. sand, mud), biological material (e.g. shells, bones, plant material), or by crystallization of minerals from water (e.g. gypsum, salt). Most sedimentary rocks form under the sea or in lakes. Loose sediments are transformed into hard rocks when minerals crystallize from the water between the grains and cement them together. This process can continue after a rock is quarried, making the rock harder as it dries out. Cementation of sediments commonly occurs on beaches, making "beachrock", which is common throughout the Aegean. Accumulation of the finest rock particles makes clay. There are many types of clay and not all are suitable for making pottery. However, good pottery clay is commonly formed in basins that also contain lignite, a low-grade coal (e.g. Corinth).

When rocks are piled on top of each other, for example during convergence, or in a sedimentary basin, those at the base are heated up and subjected to increased pressure. This is because the temperature increases with depth in the earth by an average of 30°C per kilometre. Many of the minerals that make up the rocks are not stable under these new conditions and will either recrystallize to form larger crystals or transform into new minerals, a process called metamorphism. The most common metamorphic rocks in Greece are marble, schists, and serpentinite, formed respectively from limestone, mud-rocks, and peridotite. Some areas of metamorphic rocks, such as the Cyclades, are considered to be the deeper equivalents of sedimentary rocks elsewhere. Others, like the Menderes massif south and east of Izmir, have a much more complicated history, with much older rocks and several cycles of metamorphism. Sometimes the rocks can become so hot that they melt to form plutonic rocks such as granites.

The geological structure of the oceanic crust is quite different from that of the continents – it is almost completely made of igneous rocks, that is those that were originally molten. Its base is dominated by plutonic rocks such as peridotite and gabbro that solidified deep in the earth, whereas the top is made of basaltic lavas that were erupted underwater. The lavas are in turn commonly covered by chert and limestone. Although there is no true oceanic crust in the Aegean region today, convergence of Africa and Europe has forced former parts of the oceanic crust up on to the land. The peridotites have been converted into the green or black rock serpentinite.

There are many volcanic rocks in Greece and western Turkey, mostly formed during the last 20 million years, and the activity continues today. These rocks formed when the sea-floor was thrust down deep into the earth. As the temperature rose, part of the rocks melted and the liquid made its way to the surface in volcanoes. Volcanic activity is now restricted to

Santorini (ancient Thera) and Nisyros, but in antiquity Methana and Melos were active for short intervals. There have been many different types of eruption. The largest was the "Minoan" eruption of Thera in 1650 or 1450 BC – almost 30 cubic km of volcanic ash was erupted. Since then activity has mostly been non-explosive, with the eruption of lava flows. On Nisyros volcanic activity has been marked by steam explosions with no lava or true volcanic ash.

Most metallic ore deposits, such as those of gold, silver, lead, iron, copper, and tin, are precipitated from hot watery fluids that circulate in the crust. These fluids start as surface water that descends into the crust. There it is heated, and metals, and other elements, dissolve in the water. They are precipitated as minerals when the water rises and cools. The heat necessary to drive circulation is sometimes associated with metamorphism, the emplacement of plutonic rocks such as granite or volcanism. Circulation of sea water into the oceanic crust also produces deposits of copper and other elements where these fluids vent on to the sea floor (e.g. the Troodos mountains of Cyprus).

The most common rocks in the Aegean region today are limestone and its metamorphic equivalent marble. These rocks are more resistant to erosion than other types of rocks and tend to form the hills, in the absence of tectonic movements. Paradoxically, both limestone and marble are soluble in rain water and prolonged erosion gives rise to a characteristic landscape called *karst*, after a region in Croatia. In these regions most drainage is not on the surface in valleys, but instead rain and snow-melt drain directly into swallow-holes (sink-holes). The drainage basins start as small conical depressions and can become quite large, with flat bottoms (there are many in Arcadia). Every swallow-hole is connected to a system of caves or fissures, that tend to be enlarged by continual solution of the rock. The springs can debouch many kilometres away, in some cases under lakes or the sea (e.g. the gulf of Argos). In many areas the fissure and caves system can store sufficient water for the springs to be perennial. Although *karst* caves are formed by solution of rock, precipitation of limestone from waters percolating into caves forms stalagmites and stalactites. This can only occur when there is little flow of water through the cave. A similar process deposits travertine around many *karst* springs. However, much travertine was quarried in antiquity.

Soils form by weathering of the underlying rock. Much of this weathering may have happened during the last glacial period when the climate was wetter, but glaciers were only on the peaks of the mountains. Limestone or marble gives a characteristic red soil called *terra rosa*. Although fertile, this soil is usually too thin on the hillsides for successful agriculture. In antiquity this soil was processed to give a red clay. The soft sediments that fill the grabens weather easily and tend to yield fertile soils. The best soils form on marls – sandy, clay-rich limestones. Soils washed from the hills accumulate in the valleys to form alluvial soils. The abundance of water and the renewal of these soils by material washed from the hills during storms has made these areas very productive. Drainage in antiquity and recently has greatly increased the availability of these soils (e.g. Lake Copais).

Geometres, John

Poet and prose writer of the 10th century

All that is known for certain about the life of John Geometres (or Kyriotes) is that he flourished in the second half of the 10th century. "Geometres" could refer to a profession as surveyor, to a post in the imperial fisc dealing with land measurement, or to his being a geometrician, but it may also be taken in the sense of "globe-trotter", i.e. a vagabond. "Kyriotes" probably refers to a district in southwestern Constantinople where he may have been born or possibly became a monk. There are a few slight indications that he may have been a member of the civil aristocracy: he refers to his father as an energetic servant of the empire who died in Asia; he himself owned a house on the principal street of the capital; one manuscript styles him *protospatharios*, a dignity that usually conferred membership of the Senate and in the 10th century was still mainly given to commanders of the empire's military and territorial divisions which were known as themes. The belief that he was at one time bishop of Melitene in Cappadocia is without substance. He was well read in the pagan and Christian classics and made important contributions to both prose and poetic genres.

Geometres revived and rescued from its scholastic sterility the genre of the *progymnasma*. This had lain dormant for a few centuries but, probably initially through his influence, became popular again in the 11th to 15th centuries. Designed originally as a preliminary exercise for students of rhetoric, it had speedily become a form of polished essay in its own right

with numerous subgenres and rules. Three lively encomia of the apple and one of the oak and two *ekphraseis* of his own garden (the sole surviving prose descriptions of a private Byzantine garden) survive by him. His originality is shown in his introduction of humour, parody of 4th-century *progymnasmata*, and Christian elements (which on occasion even approach blasphemy, as when the medicinal virtues for physical ailments of a rotten apple are compared with the salvific virtues for spiritual ailments of Christ when he had taken on corruptible flesh). He also mixed subgenres in an unprecedented way, including an imaginary speech and an erotic myth of possibly his own invention in encomia of the apple, while his *ekphraseis* of his garden are addressed as letters to a friend and his encomia of the apple are covering letters for gifts of the fruit. His artistry in the *progymnasmata* is best shown in his encomium of the oak which follows all the hallowed rules of what topics should be included in the encomium of a plant, yet with almost imperceptible subtlety describes the life cycle of the tree in human terms from birth by immaculate conception to the role of grandparent.

Two homilies, on the Annunciation and the Dormition of the Virgin, alone survive (from at least four that he wrote). Though on traditional themes, they exhibit important differences from their simpler predecessors. Less concerned with the narrative of events and the personalities of the characters, they rather comment on stories with whose details their auditors are assumed to be familiar. They are thus more abstract and resemble theological tracts with scholarly and other digressions.

Geometres' rhetorical expertise, evident in both homilies and *progymnasmata*, extended to the theoretical. His commentaries on rhetoricians of the Second Sophistic survive only as lengthy quotations in the works of successors such as John Doxopatres, but in that form they became very influential in Byzantium. He was often more systematic than his predecessors and was one of the first rhetoricians to study the style of early Christian writers (most notably in an encomium on Gregory of Nazianzus and in commentaries on some of his works). He was also sufficiently a realist to reject the theoreticians' condemnation of obscurity, claiming that it is not in "every instance a vice; on the contrary it is often even a virtue".

In verse Geometres virtually invented a new genre, that of political poetry (this must not be confused with the metrical term "political verse"), through a series of compositions ranging from just 2 to more than 100 lines. These were written mainly in the reigns of Nikephoros II Phokas (963–69) and John I Tzmiskes (969–76), but a few probably date from just before 963 and one from probably as late as 989. They describe the achievements of the emperors and other events such as rebellions, a foreign (Georgian?) invasion, and an alliance of the Rus and Bulgarians against Byzantium. His favourite emperor is Nikephoros, whose assassin John he both praises and portrays in Macbethian manner as a lion reduced by his crime to a trembling hare frightened by false dreams. Other poems extol the beauties of nature or one of the defensive towers of the capital, praise saints or, more enthusiastically, ancient philosophers, mock a literary opponent or a man who could not distinguish in pronunciation between *l* and *r*, and mourn the barbarization of language and customs of Greece. In perhaps his most remarkable and innovative poem he describes the natural and human devastation around Selymbria, saddened by which he set out for Constantinople only to hear of the even more lamentable destruction caused there by fire and earthquake. This poem combines *ethopoiia* (character-drawing) with *ekphrasis*, formulaic expressions with personal pathos, high poetry with autobiography.

Geometres' religious poetry includes a panegyric on St Panteleimon written in iambics. Such a thing, though not unique, was very rare and differed from both the usual prose Life and the much shorter poetic encomiastic sermon in the form of a canon (a type of hymn). Four hymns praise the Theotokos (the Virgin Mary) and shorter poems on traditional subjects concern the Annunciation, the Nativity, the Assumption, the individual instruments of the Passion, Lazarus, the Samaritan Woman, the discovery of the head of St John the Baptist, etc. A further collection of 94 quatrains on the monastic life is attributed in numerous manuscripts either, impossibly, to St Nilus or to Geometres. If the latter attribution is correct, they would add to his reputation through their frequently striking imagery, their occasionally original thought, and their sophisticated versification.

Geometres was one of the most attractive and innovative of Byzantine writers. An accurate assessment of his importance must, however, await the literary history of Byzantium that still remains to be written.

A.R. LITTLEWOOD

Biography

John lived in Constantinople in the second half of the 10th century. Little is known of his life except that he served in the army and later became a monk. He wrote essays (reviving the genre of *progymnasmata*) and homilies (on traditional themes) as well as religious verse (panegyrics), epigrams, and political poetry on contemporary events.

Geometric Period *c.*900–*c.*700 BC

The Geometric period of ancient Greece is normally understood to last from *c.*900 to *c.*700 BC, taking its name from the "geometric" style of pottery decoration found throughout the

Greek world at that time. This style is characterized primarily by the use of rectilinear motifs in various combinations; while it may also include the pictorial representation of both animals and humans, especially in the 8th century, these also follow the prevailing artistic conventions and appear obviously "geometric" in form.

The Geometric period can be said to have begun in Athens, where the characteristic style first emerged *c.*900 BC, evolving from its predecessor, the Protogeometric, which itself developed there around the middle of the 11th century BC. The pottery decoration follows a definite stylistic evolution, so that the period can be divided into three phases, the Early, Middle, and Late Geometric (EG, MG, and LG respectively), each of which may be further subdivided into two phases. The traditional dates for these phases are: EGI 900–875 BC; EGII 875–850 BC; MGI 850–800 BC; MGII 800–760 BC; LGI 760–735 BC; and LGII 735–700 BC. A word of caution is needed, however, when referring to these dates since, strictly speaking, they apply only to Athens. In fact, the whole chronological framework of the period has recently come under attack due to the rather tenuous nature of the evidence supporting it; a heavy reliance has been placed on the stylistic development of the pottery, taken in conjunction with historical accounts, since other methods that might be expected to yield more precise information, such as radiocarbon dating and dendrochronology, have not proved particularly useful. Some confirmation for the dating scheme accorded to the pottery has been possible, for it has occasionally been found in association with Egyptian objects, particularly scarabs, which are datable to the reigns of individual pharaohs. Other information has been provided by relating the ceramic evidence to the traditional foundation dates of the Greek colonies in Italy as given by later writers such as Thucydides, but this is of limited value since it applies only to the last 50 years of the Geometric period; other historical events noted by ancient authors, such as the first Olympiad in 776 BC, have also been used, but in general there are very few fixed chronological points. Given this lack of corroborating evidence, some recent scholarship has suggested that all dates for the early Iron Age, including those for the Geometric period, should be lowered, but this view has itself met with much criticism and has failed to win general approval.

Dating for the various phases of the Geometric period also differs from place to place. The phases in Geometric decoration found in the Argolid and Corinthia match those at Athens very closely in development and date, but further afield the pace of the acceptance of change appears to have been somewhat slower and there is thus often a time lag in comparison to Athens. In Laconia and west Greece, for instance, the Protogeometric appears to have continued to the middle of the 8th century BC, while in east Greece the Early Geometric phase is very difficult to assess, and in Thessaly it is impossible to distinguish the end of the Late Geometric phase. Similar problems and uncertainties are also apparent in other areas, making it clear that the history of the Geometric style must take into account significant regional variation.

When the Bronze Age palace civilization came to an end at some point in the 12th century BC, all the components that had made that civilization what it was collapsed; the Greek world entered a new phase of its history, the Iron Age. The early part of the Iron Age (*c.*1200–900 BC, a period often also called the Dark Age) has traditionally been viewed as a time of poverty, isolation, and depopulation, and even though this picture may be more representative of our own relative lack of knowledge about the period, there is also some truth in the traditional view that the Greeks had, in a sense, to rebuild their civilization. By about 900 BC, however, when the Geometric period begins, some degree of stability appears to have returned. The Geometric period was thus a time of great change, a time when the Greeks finally overcame many of the difficulties associated with the so-called Dark Age, and a time of rebirth characterized by the appropriately named Greek renaissance of the later part of the 8th century BC (LG).

A great deal of information about the period comes from the graves that have been found all over Greece. From the Kerameikos and Areopagus areas in Athens, for example, comes a wealth of information about burial customs and about the pottery used in those burials. Generally cremation was employed, the bodies being burned on a pyre and then placed in a pot which was itself buried in a pit along with various possessions and gifts. The ash urns were different for men and women, and the goods contained in each also seem to have been gender-specific, weapons for instance in male burials, jewellery in female burials. Customs, however, varied at different times, and children were normally inhumed, often with their toys, while for a short time in the Late Geometric period, inhumation was also adopted for most adults. It is at this time that the very large Dipylon amphorae and kraters were used in Athens as grave markers. These pots, named after the area of the cemetery in which they were found, were all made in the same workshop and bear figured scenes representing the *prothesis* (lying in state) and *ekphora* (funerary procession). For many, these pots are the epitome of Greek Geometric art. Burial customs also differed in other areas of Greece, with some regions preferring inhumation, others cremation, while specific practices varied within these two categories. Interpretation of the burials and their contents has thus provided some understanding of social and economic organization among different individuals and groups at this time.

It was during the Late Geometric period, however, that the most significant changes occurred. This is the era of the Greek renaissance, so called because the substantial developments that took place at that time suggest a rebirth after the Dark Age. Some scholars take the very sharp rise in population that occurred in the 8th century BC as the catalyst provoking all the changes; consequent overpopulation, they argue, led to increased pressures on land and resources that in turn led to a growth in political centralization characterized by the emergence of the polis (or city state) ruled by aristocracies. Warfare among these newly established Greek states was also a very common occurrence in this period.

Essential to this renaissance are the contacts with the outside world which, although never entirely lost in the previous centuries, are now seen on a much grander scale. These contacts themselves can partly be viewed as the result of some of the pressures facing the Greeks in the 8th century BC, pressures caused by such factors as overpopulation, a shortage of good land, a need for access to more natural resources, and political dissatisfaction. Partly to alleviate some of these troubles and to find solutions to them, a great colonizing move-

ment began *c.*750 BC. The Greeks from some of the most developed (and hence often most troubled) states, such as Corinth, Megara, and Euboea, sent colonies to south Italy and Sicily. In the east, trading centres were established at places such as Al Mina on the Levantine coast, and trade was extended to other areas that included the Near East, Asia Minor, and Egypt. These eastern contacts in particular would profoundly affect Greece.

In the religious sphere, change is also very noticeable, especially in the sanctuaries. Although some of these existed earlier in the Geometric period, archaeological evidence indicates that there was a strong increase in the level of activity taking place at them by the 8th century BC; masses of votive offerings have been found, particularly pottery and, by the later part of that century, metal goods also appear. By that time temples to the gods were also being constructed, most of rather modest construction, but a few of massive size.

Contact with the east also brought about the adoption of the alphabet, knowledge of which was obtained through the Phoenicians and adapted somewhat by the Greeks to suit their own language. Literacy had finally returned after an absence of more than 400 years. This was a monumental achievement and among its earliest manifestations are the great Homeric epic poems, the *Iliad* and the *Odyssey*, soon followed by the works of the didactic poet Hesiod.

The adoption of the polis meant that, in this period, the Greeks never developed a real sense of nationality as we would think of it, yet they certainly possessed a great sense of national consciousness and pride, a Hellenism that partly manifested itself in the growth of the great Panhellenic sanctuaries, such as Olympia and Delphi. Indeed, their renewed contacts with the outside world helped to foster their identity – they were Greeks, the others were barbarians. The transformations of the 8th century BC led directly to the significant achievements of the archaic period that followed the Geometric.

Summary

The Geometric period, *c.*900–700 BC, is named after the geometric style of pottery decoration that prevailed at the time throughout Greece. Archaeology provides information of burial customs and of religious practices. Population growth inspired the colonization of areas in the central and eastern Mediterranean. From the east came knowledge of the alphabet which enabled the composition of the poetic works of Homer and Hesiod. Adoption of the polis (organization into city states) brought with it a sense of Panhellenic cultural pride.

George I 1845–1913

King of the Hellenes

King George I was the second son of Christian, Crown Prince of Denmark. Born in 1845 in Copenhagen, he was assassinated in Thessalonica in 1913. Despite his violent death, he was the longest-reigning sovereign of Greece. Throughout his reign he struck a balance between the international and domestic stability of his country.

Prince William George studied at the Danish Naval Academy and was appointed constitutional King of Greece by the three guarantor powers of Greece, namely Britain, France, and Russia, as successor of King Otho, by a treaty signed in London on 1 July (Old Style – OS)/13 July (New Style – NS) 1863. Otho had been deposed by revolution on 10 October 1862 (OS). The appointment of King George was considered to have been influenced by British interests in the eastern Mediterranean, partly because he had been chosen by Lord Palmerston, the British prime minister, and partly on account of the dynastic relationship between the Danish and the British royal families. Indeed, Britain demonstrated its favour towards the young king in 1864 by handing over to Greek sovereignty the Ionian Islands, a British protectorate since 1815. His title "King of the Hellenes" denoted the nation's perception of his role as king also of the unredeemed Greeks.

Upon his arrival in Greece in October 1863, King George faced a suspicious constituent national assembly, whose proceedings he was unable to influence effectively. Regardless of the king's opposition, the 1864 constitution provided for a unicameral political system, in which the country's leading politicians, who had overthrown the Bavarian dynasty, held virtually unlimited power in the name of the nation.

The king's most serious confrontation with parliament occurred during the Cretan insurrection of 1866, when the parliamentary majority endorsed prime minister Alexandros Koumoundouros and his policy of support for the Cretans against the Ottoman empire, a policy also encouraged by Russia. The king first alienated the Greek government by marrying the Russian grand duchess Olga in 1867, without the knowledge of the Greek prime minister, and then dismissed the Koumoundouros cabinet in January 1868, to avert a war with the Ottoman empire over Crete. Such a war threatened to destabilize the whole region. This royal initiative resulted in a long series of minority cabinets, serious tension between the king and the country's political forces, and, ultimately in 1874, a constitutional crisis. The crisis was resolved in April 1875, when king George turned to his radical opponent, Charilaos Trikoupis, and summoned him to form a government and to hold fair elections.

In his inaugural speech to parliament the following October the king pledged his commitment to majority governments; the speech was the work of prime minister Charilaos Trikoupis. The king's overall relationship with the Greek politicians improved thereafter. Once in office, Trikoupis moderated his earlier radical views and for the next 15 years became the king's trusted political leader. The king, on the other hand, saw in Trikoupis a source of political stability, a realistic prospect of modernization, and, not least important, pro-British foreign-policy priorities. Thus between 1875 and 1892 a two-party system functioned with hardly any royal interference. The king's main preoccupation was with Greece's national interests in his annual unofficial tour of the European capitals. Indeed, in moments of international tension, like that of the Eastern Crisis of 1878, he could argue convincingly and for the benefit of Greece's irredentist programme that, if he became unpopular with his subjects, the stability of his throne could be endangered. The crisis ended with the annexation of Thessaly and Arta to Greece in 1881.

In 1887 king George received kaiser Wilhelm of Germany for the wedding of his son, crown prince Constantine, to princess Sophia, Wilhelm's daughter, in Athens. In 1888 the Greek king celebrated the 25th anniversary of his reign. Both occasions were exploited by prime minister Trikoupis to enhance the king's popularity. This popularity however suffered when in February 1892 king George removed from office prime minister Theodore Deliyannis on account of his financial policies, despite his parliamentary majority, in transgression of the 1875 royal commitment to parliament. Greece, through the financial policies of Trikoupis, had borrowed heavily on foreign markets and its creditors were becoming anxious over its ability to meet its obligations. In his efforts to secure a ministry more amenable to the pressures of Greece's foreign creditors, king George unsuccessfully tried to create a third royalist political party by summoning K. Konstantopoulos and S. Sotiropoulos to form cabinets. As a result, the king incurred the hostility of the two dominant Greek political parties. His popularity further suffered after Greece's military defeat in the war with Turkey in 1897, for which the royal family and entourage were held responsible.

After an abortive attempt on his life in February 1898, the last years of his reign were marked by the revolt of the "Military League" in August 1909, whose anti-dynastic dispositions were tempered and channelled by the Cretan statesman, Eleutherios Venizelos, into a revision of the 1864 constitution in 1911. Thereafter, Venizelos and King George cooperated for the military and diplomatic preparation of Greece in view of its confrontation with the Ottoman empire for the acquisition of Macedonia, Epirus, Crete, and the Aegean islands. After the victory of Greece in the First Balkan War in 1912 and the liberation of Thessalonica, King George resided in that city to highlight Greece's legitimate rights to the region in the face of Bulgarian counter-claims. He was assassinated in Thessalonica on 5 March 1913 (OS). The motives of his assassins have remained obscure.

Through his capacity for compromise and his political sagacity, which are in striking contrast to the inflexibility of his successor, King Constantine I, King George secured for Greece a stable parliamentary regime and significant territorial gains.

Biography

Born in Copenhagen in 1845, George was the second son of king Christian IX of Denmark. After the deposition of king Otho in October 1862, he was chosen by the protecting powers (Britain, France, and Russia) to succeed as "King of the Hellenes". He married Olga, niece of tsar Alexander II, by whom he had seven children. He was assassinated in the newly liberated Thessalonica in 1913.

George II 1890–1947

King of the Hellenes

George II, son of Constantine I, was born in Athens in 1890. He became king of Greece in 1922 but in 1924 was overthrown after the proclamation of the republic of Greece. He then found asylum in Great Britain. The British strongly endorsed his restoration and he associated himself with British foreign policy. After an unsuccessful *coup d'état* by the Republicans on 1 March 1935, the monarchy was restored and George II returned to Greece. A manipulated plebiscite on 3 November 1935 produced a vote of 97 per cent in favour of the restoration of the king.

As soon as George II returned to Athens he became associated with his old friend General Ioannis Metaxas. After the death of the prime minister, Constantine Demertzis, in April 1936, George II promoted Metaxas from deputy prime minister to the post of premier, despite the fact that his party had only six deputies in parliament.

On 4 August 1936 George II approved Metaxas's right-wing dictatorship and rejected an offer from the leaders of the two major parties in parliament (the Liberals of Themistoklis Sophoulis and the Populists of Ioannis Theotokis) to form a coalition government. He supported all the oppressive measures of Metaxas's regime, including the imprisonment and exile of politicians and trade union leaders and the suppression of freedom of speech. Metaxas even censored Pericles' funeral oration in Thucydides' history.

After Metaxas's death in January 1941, which left Greece in a state of war against Italian fascist forces, George II made no attempt to restore constitutional order. When the German army invaded Greece in April 1941, the king and his government under Emanuel Tsouderos, together with units of the Greek army and navy, escaped to Cairo, where they established a Greek government in exile.

During the occupation of Greece by Axis forces (1941–44) George II lived in exile, moving between Cairo and London. The occupation of Greece and the resistance of the anti-monarchist National Liberation Front (EAM) and its military wing the Greek Popular Liberation Army (ELAS) led to a new constitutional crisis for the self-exiled king.

With the withdrawal of the Axis forces from Greece in the autumn of 1944 and the demobilization of the Greek Popular Liberation Army, the British, who had already brought Greece under their sphere of influence, made every effort to restore the monarchy along with a right-wing government in Athens. On 1 September 1946 a coerced plebiscite permitted George II to return as king. Although the validity of the plebiscite was disputed by the liberal parliamentary opposition and the Left in particular, the king received the support of the British and American Allies who looked upon the Greek monarchy as the sole bulwark against Soviet expansion in the area.

George II died in March 1947 under peculiar circumstances. He was succeeded by his brother, who came to the throne as Paul I. George II was an authoritarian personality who chose not to play the role of a constitutional king. He lost popular support by associating himself with unconstitutional practices and even more by endorsing the various dictatorial and authoritarian measures imposed by Metaxas and other right-wing governments. His successors Paul I and Constantine II (his nephew) continued in the same vein and brought the monarchy of Greece to its inevitable demise.

STEPHANOS CONSTANTINIDES

Biography

Born in Athens in 1890 the eldest son of king Constantine and queen Sophia, George studied at the Military Academy in Athens and in Berlin. He came to the throne in 1922 but left Greece in 1923, the year before a republic was declared. Recalled in 1935, he supported Metaxas's dictatorship. During the German occupation (1941–44) he lived in exile. He returned to the throne in 1946 but died in 1947.

George of Pisidia

Poet of the early 7th century AD

George is best known for his panegyrical poems in iambic trimeters that celebrate the Persian campaigns of the emperor Herakleios I during the 620s. Probably originally from Antioch in Pisidia, his working life was spent in Constantinople, where he was among the many deacons of Hagia Sophia and pursued a successful administrative career in the service of the patriarch Sergios, reputedly rising to the position of archivist and head of the patriarch's secretariat (*chartophylax*). Hence, as with Agathias's circle half a century earlier, poetry was George's second career; his ecclesiastical environment is an important key to understanding his writings.

George's literary activities formed part of a wider cultural revival promoted by Herakleios to help underpin his unconstitutional and insecure regime. Sergios too played a major role in this revival, and he is as prominent as the emperor in the dedications of George's poetry. The *History* of Theophylaktos Simokattes and the *Chronicon Paschale* (or *Easter Chronicle*, because of its interest in chronology and the dating of Easter) are products of the same era. The transferral of the Neoplatonic philosopher and polymath Stephen from Alexandria to Constantinople and the establishment of a library by Sergios should also be linked with it.

George's works have traditionally been divided into the two categories of panegyrical epics and religious poems, but all have a strong religious flavour: Herakleios's campaigns are justified as an attempt to establish the universal authority of God in the face of the Persian worship of moon, stars, and fire, elements that are God's creations. His one surviving prose work also has a religious theme: it elaborates the *Acts* of the contemporary martyr Anastasios the Persian. Like *On the Resurrection* (?624), George's principal work, a *Hexaemeron* (1900 lines), encompasses the two categories: it encloses an account of the wonders of God's Creation within a framework inspired by the immediate political context of Herakleios's victory over Persia in 628, culminating in a prayer for the emperor and his dynasty put into the mouth of the patriarch Sergios. A more useful distinction can be made between brief poems of 100 or so lines and longer works with a significant narrative element. The former group, transmitted as "impromptu" pieces, evoke the emotional atmosphere in Constantinople at particular moments (for example, *To Bonus*, calling for the emperor's return from campaign in the east to rescue the capital from the Avars in 626, and *On The*

Restoration of the Cross, celebrating the climax of Herakleios's achievement in restoring to Jerusalem in 630 the remnants of the True Cross which had been pillaged by the Persians in 614). The second group are elaborate, doubtless commissioned, pieces such as *On the Persian Expedition* (maximizing the achievement of Herakleios's first campaign in 622), *On the Avar War* (describing the near-successful Avar siege of 626), and *Herakleios* (a survey of the reign composed at the moment of victory). The Constantinopolitan perspective and the prominent religious undercurrent are fundamental to George's *oeuvre*.

By the 7th century Hellenic traditions of education and culture were struggling to survive. Hitherto the hexameter had been the traditional medium of imperial verse panegyric, and George's preference for iambics, while developing a Late-Antique custom of prefacing hexameter panegyric with an iambic prologue, doubtless also represents an attempt to maximize his accessibility. So too does his taste for the inclusion of brief maxims, many of them lifted from tragedy, probably via the compilations that proliferated in this period. But George sustains a high prosodic standard, combining quantitative accuracy with sensitivity to regulation of accent. The maxims have a structural function in articulating thematic transitions and are often combined with first-person interjections, a technique that has its roots in Pindar. Close philological study uncovers subtle and creative allusions to classical texts in both poetry and prose, while the vocabulary incorporates many prose formations (especially medical) and neologisms. Stylistically George is strongly influenced by contemporary taste for elaborate rhetoric and word-play, but deploys the familiar topics of panegyric with originality, often integrating metaphor and narrative with striking novelty. The slide from narrative to image is sometimes barely perceptible, while sustained images can have a daring that anticipates the Metaphysical poets (e.g. a comparison between Sergios and the Virgin, *Avar War*, 130–44). For George the integration of Classical and biblical is unproblematic, even exuberant, an advance upon the apologetic stance of 6th-century literary writers.

George's works were influential in Byzantium in several distinct areas. First for their content: the poems for Herakleios are a crucial source for the Persian wars of the 620s, quoted extensively (including lost works) in the prose chronicle of Theophanes (*c.*810), who may have used a prose/verse compilation produced by George himself. Second, George was greatly admired for his language and style: the 10th-century *Suda* lexicon includes 76 citations, roughly half from poems no longer extant. Most memorably, the 11th-century politician, historian, and academic Michael Psellos composed a brief essay, probably to impress his students, in response to the question "Who was the better poet, Euripides or Pisides?". Psellos's judgement is lost in a lacuna, but his discussion offers invaluable insight into tastes and attitudes to earlier literature among middle-Byzantine literati. Versification and diction and their adaptation to characterization and subject matter, rather than content or context, are paramount: Psellos is as interested in Euripides' lyrics as in his iambics, while it is George's ability to pull out rhetorical stops in vivid description that probably proved his superiority.

The main vehicle for the transmission of George's poems is an 11th-century anthology (cod. suppl. gr. 690, in the Bibliothèque Nationale, Paris), perhaps compiled in the reign of Basil II (976–1025). The *Hexaemeron*, however, enjoyed a flourishing manuscript tradition (approximately 50 manuscripts, as well as 14th-century Slavonic and Armenian translations), due to a false attribution to Cyril of Alexandria and the wide appeal of a topic that fell within an established tradition. But George's poem is innovative: it focuses on the individual's endeavour to comprehend God through progress in contemplating his created universe and incorporates contemporary Christian Neoplatonic thinking alongside biblical paradigms.

Today the juxtaposition of George with Euripides shocks, but Psellos's essay, together with the extensive interest of the *Suda*, signals George's Janus-position between Classical and medieval literature, as well as providing a salutary reminder of the limitations of modern perspectives.

MARY WHITBY

Biography

Nothing is known of George's time of birth, but he came from the region of Pisidia and was probably born in the town of Antioch there (not to be confused with the more famous Antioch on the Orontes). He lived most of his life in Constantinople where he was a deacon at Hagia Sophia and worked as archivist to the Patriarchate. He was active during the reign of the emperor Herakleios (ruled 610–41), and wrote panegyrical epics in praise of the emperor's campaigns. He also wrote religious poetry, notably the *Hexaemeron* on the wonders of the Creation and *Against Severus*. The date and place of his death are unknown.

George of Trebizond 1395–1472/73 or *c.*1484

Scholar

George of Trebizond, humanist teacher, rhetorician, and translator, was one of the expatriate Greek scholars whose activities in Italy during the 15th century helped to stimulate the development of Greek studies there. Originally from Crete, where his family had moved from Trebizond, he emigrated to Italy around 1416, and earned his living initially by teaching Greek in Vicenza and Venice, while studying Latin under Vittorino da Feltre and Guarino da Verona. From about 1440 he was living in Rome where he entered the papal curia as a secretary. He soon acquired a reputation for ill-temper: he denounced the scholar Lorenzo Valla as an ignoramus, came to blows with the humanist Poggio Bracciolini, and on more than one occasion was briefly imprisoned in the Castel Sant'Angelo.

In spite of his cantankerousness, his gifts as a scholar were soon recognized. He became the leading lecturer in humanist studies in Rome and, along with his rival Theodore Gaza, one of the greatest Greek teachers in Italy in the generation after Manuel Chrysoloras. He was also a prominent member of the Academy that met at the house of cardinal Bessarion. He was

George of Trebizond, a 16th-century engraving

encouraged by the scholarly pope Nicholas V to make translations of Greek classical texts into Latin, and proved to be a prolific worker, making Latin versions of the works of Plato, Aristotle, Demosthenes, Ptolemy, Eusebius, and the Cappadocian Fathers. Unfortunately, his work was often criticized for inaccuracy by contemporaries, especially by Theodore Gaza and Bessarion. Although George's translations undoubtedly contained mistakes, the criticism seems to have stemmed in part from a difference in method: George himself favoured a literal, word-for-word approach, and if a passage was obscure it was his practice to elucidate the meaning with a marginal note. Gaza, on the other hand, preferred a freer rendering that conveyed the spirit of the text. In the next generation the merits of George's translations were perceived by the humanists Angelo Poliziano and Erasmus. His version of Ptolemy's *Almagest* became standard and was printed in 1538.

Another unfortunate episode in George of Trebizond's career was his estrangement from Bessarion and the other members of the Academy from about 1450, partly as a result of Bessarion's criticisms of his translations, and partly because George became alarmed at the increasing admiration for the philosophy of Plato and for the works of Bessarion's teacher, George Gemistos Plethon. In 1458 George wrote a strongly worded denunciation of Plato, entitled *Comparisons of Aristotle and Plato*, in which he claimed that Plato's ideas led inevitably to immorality and heresy, and denounced any attempt to reconcile Platonism with Christianity. For George, Plethon was a case in point, and he claimed that he had overheard Bessarion's teacher prophesying that Christianity and Islam would soon pass away and be replaced by a new paganism. However, in his strong antipathy to Platonism and its advocate, George found a formidable adversary. His assault

prompted Bessarion to publish his *Against the Calumniator of Plato* in 1469, the "calumniator" being George himself. The controversy raged for more than a decade, with George being joined by his son, Andreas (died 1496) in his attack on the Platonists. Ultimately, however, it was Bessarion's reconciliation of Plato with Christianity that gained ground among the humanists, leaving George of Trebizond increasingly isolated.

Less contentious than his attack on Plato, and more successful than his translations, was his *Five Books on Rhetoric*, which he completed in Venice in 1434 and in which he attempted to provide a synthesis of the Latin and Greek rhetorical traditions. The work was to have a major impact on humanist education, revealing to the Italians for the first time the works of the great Byzantine rhetoricians. By taking examples both from Byzantine authorities such as Dionysius of Halicarnassus, Maximus the Philosopher, and Hermogenes, and from Latin writers, especially Cicero, Livy, and Virgil, George succeeded in producing an authoritative work on the subject that circulated throughout Europe and which remained in widespread use until the late 16th century. So highly regarded was it that the German Protestant theologian and humanist Philip Melanchthon justified his own short book on rhetoric solely because it would save students the expense of buying George's larger one. It was superseded only when translations and epitomes of Hermogenes became generally available.

George of Trebizond was also the author of a prodigious number of other works in Latin on logic, philosophy, astrology, and astronomy, as well as several theological works. His *Introduction to Dialectic*, written in about 1440, summarized Aristotle's teaching on dialectic in an accessible way, shorn of scholastic accretions, and in an elegant Latin acceptable to the humanists. He wrote a massive commentary on Ptolemy's *Almagest*, explaining Ptolemy's astronomic theories on the basis of the ancient Greek commentary of Theon of Alexandria. His *On the Truth of the Christian Faith* (1453), addressed to the Turkish sultan Mehmet II, called upon him to adopt Christianity and to become a universal ruler in imitation of Constantine the Great. Although a convert to Catholicism, George even ventured into traditional Byzantine hagiography in his account of the recent martyrdom of St Andreas of Chios. Yet even in this work he could not resist a jibe at his opponents, ending with a prayer to St Andreas, bidding him to "suppress by your intercession these Platonists rising here in Italy".

JONATHAN HARRIS

Biography

Born in Crete in 1395, where his family had moved from Trebizond, George emigrated to Italy *c.*1416 and taught Greek in Vicenza, Venice, and Rome. Having converted to Catholicism, he worked as a secretary in the papal curia. He translated many ancient Greek texts into Latin (though his versions were much criticized) and produced many works of his own including the influential *Five Books on Rhetoric*. The date of his death is unknown.

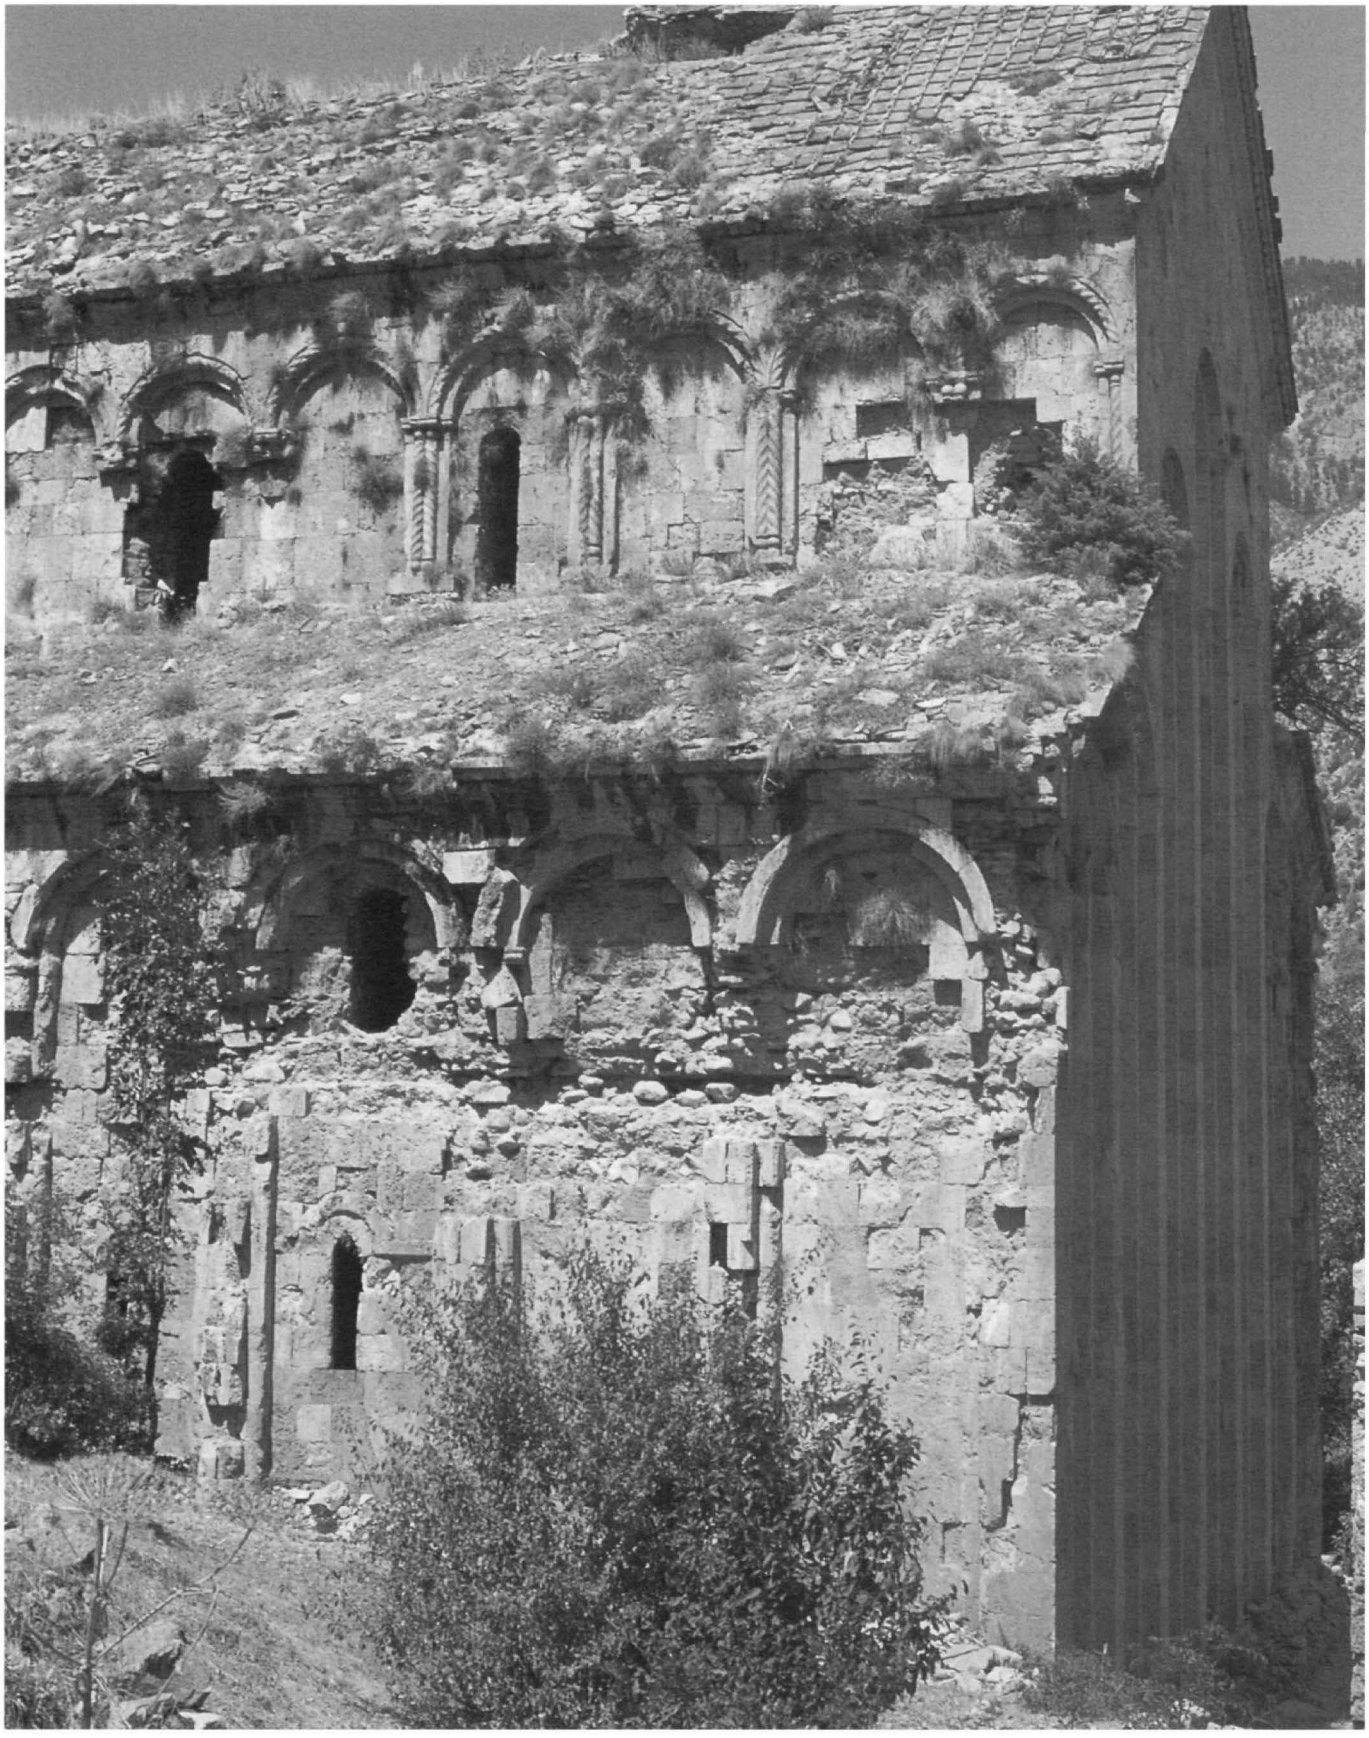
Georgia

The land of Georgia occupies the southern slopes of the central section of the main Caucasus range. To the west it is bounded by the eastern coast of the Black Sea. To the east it stretches to Azerbaijan in the direction of the Caspian Sea. To the south it is bordered by Turkey and Armenia, with a historical claim to a substantial portion of northeast Turkey (the Tao-Klarjeti of the Georgian tradition).

The name Georgia has encouraged the idea that this land was so named by the Greeks on account of its agricultural resources (*georgia* means "farming" in Greek). (Georgians use an entirely different term, *sakartvelo*, and term themselves *kartvelebi*.) However, the apparently Greek name is now taken to be a derivation from an Iranian root, *Gurj*. Greeks in antiquity did not use the term Georgia, but referred instead to western Georgia as Colchis (Byzantine Lazike) and to eastern Georgia as Iberia. The existence of these two Greek names reflects the principal geographical division within Georgia, caused by the so-called Surami ridge. As a result of this ridge, western Georgia looks across the Black Sea towards Europe and the Aegean, while eastern Georgia looks to Iran and Central Asia.

Greek knowledge of western Georgia is firmly attested by 700 BC in the poetry of Eumelus and Hesiod. The myth of the Argonauts, which was known to Homer, gave Colchis a particular significance in Greek culture from earliest times. However, according to archaeological evidence and later literary sources Colchis was not settled by Greeks until about 550 BC. From the 4th century BC Greek texts mention the towns of Dioscurias (modern Sukhumi), Guenos (near modern Ochamchira), and Phasis (near modern Poti) as Hellenic communities. In particular, Dioscurias and Phasis are said to have been founded by Greeks from Miletus, in the latter case led by one Themistagoras. The archaeological evidence also points to a significant Greek presence elsewhere on the coast of Colchis, at Eshera (north of Sukhumi), at Pitchvnari (near Kobuleti), at Tsikhisdziri, and perhaps in the environs of Batumi, which the Greeks of antiquity named Bathus Limen ("deep harbour"), whence its modern name.



Georgia: Byzantine church at Dörfkalise (now in Turkey). Blind arcading with ornate spandrels was a feature of 11th-century Georgian churches.

Greek influence spread up the numerous rivers of Colchis into the hinterland, but not across the Surami ridge into Iberia. When Hellenic culture reached eastern Georgia it came with the Seleucids, who claimed Iberia as part of their imperial sphere. In Iberia Greek culture met not only local culture but also strong influences from further east. In later centuries Iberia was to be the diplomatic and military battlefield upon which the Byzantine Greeks fought the Persian empire, especially in the 4th to 7th centuries AD. Iberia's conversion to Christianity in about AD 337 helped the Greek cause, but Arab conquest in the mid-7th century was conclusive. Ironically, the loss of Iberia followed hard upon the famous Byzantine victory at the siege of Tiflis (modern Tbilisi), captured by the forces of the emperor Herakleios in 627. However, Iberians continued to exert influence at Byzantium: in the 10th century the Iviron monastery was established on Mount Athos by St Evthymios and his father.

By contrast, western Georgia had become an integral part of the Greek world, albeit at its periphery (e.g. Plato, *Phaedo* 109b). Colchis was known in classical Athens as a mercantile destination (Aristophanes, *Holkades*), providing a famous type of linen which rivalled that of Egypt, according to Herodotus (2. 104–05). When Xenophon's 10,000 reached the Black Sea at Trapezus (modern Trebizond) in 400 BC, he saw the potential of Colchis and apparently contemplated settlement in the region of Phasis (*Anabasis* 5. 6. 36). In the Pontic empire of Mithridates VI Eupator, from about 100 BC, Colchis was a principal reservoir of resources, providing quality timber and all else needed for shipbuilding. The Greek geographer Strabo mentions that a member of his family had been Mithridates' viceroy there (11. 2. 18).

Byzantine Colchis was regularly known as Lazike, for the Lazoi had managed to establish an empire for themselves over the other tribes of western Georgia by the 4th century AD. They had done so with the support of the Byzantines, for whom the region was of particular significance because it could offer the Persians access to the Black Sea. The Byzantine historians Procopius of Caesarea and Agathias relate in detail the struggle between the two empires in Lazike in the 6th century AD, when Justinian I founded the new city of Petra at Tsikhisdziri.

A new process of Greek settlement in Georgia began around 1800, encouraged by imperial Russia, newly dominant there. Greek miners, craftsmen, and farmers, largely from the Ottoman empire, were encouraged to settle, not least in eastern Georgia. They were welcome both for their skills and for their manpower, a contribution to Christian resistance to the Turkish threat. On the eve of the World War I the number of Greeks in the Caucasus, most of them in Georgia, was 180,123. In 1920–21 it was therefore natural that many of the Greeks of the Kars region made their way to Greece through Georgia, particularly the old Greek colonies of the Black Sea coast. This can only have encouraged the Greeks of Georgia to join the many Greeks of the Soviet Union who now sought to obtain a new life in Greece proper.

That tendency was further encouraged by the Soviet persecution of Greeks, which began in 1929–35 as a by-product of the collectivization of agriculture, since many Greeks were farmers. However, Greek culture was tolerated and even encouraged until 1936–38, when Greek schools were closed, Greek printing presses stopped, and Greek cultural events obstructed. Subsequently, the Greeks of Georgia suffered again, caught up with others of the region in Stalin's policy of deporting small ethnic groups away from the German front for fear of their treason. During the Gorbachev years (1985–91) and the emergence of the independent Republic of Georgia, the place of Greeks and Greek culture in Georgia was normalized, though the social and economic attraction of migration to Greece continues to exert a powerful influence.

Germanos I

Patriarch of Constantinople, 7th–8th century

Germanos, who is said to have been more than 90 years old when he died sometime between 730 and 750, was born into a noble Byzantine family that owned property at Platanion, near Constantinople. His father, Justinian, was reputed to have been a kinsman of the emperor Herakleios I (608–41), under whom he held high office. Germanos received a thorough classical education at Constantinople. In 688 his father was implicated in the murder of Constans II and executed, Germanos himself being castrated at the same time. He made his career in the clergy of the Great Church of Hagia Sophia in Constantinople, and eventually became their head. He is said to have been involved in both the Sixth Ecumenical Council held in Constantinople in 680–81, which condemned the Christological heresy of Monothelitism, and in the so-called Quinisext Council of 691–92, which put in hand a major reform and consolidation of the canon law of the Byzantine Church. There would be nothing surprising about his involvement, but there is no clear evidence. In the early years of the 8th century he was appointed metropolitan of Cyzicus. During

the brief reign of the usurping emperor Philippikos-Bardanes, who convoked a synod to restore Monothelitism, Germanos seems to have been compliant. But when he was appointed to the patriarchal chair in 715, after Philippikos's fall, he promptly called a synod that condemned Monothelitism. He was patriarch during the last Arab siege of Constantinople in 717–18, the successful issue of which was attributed to the protection of the Mother of God. When the emperor Leo III (716–41) introduced iconoclasm by edict in 730, Germanos refused to accept the imperial will, resigned his patriarchate, and retired to his estate at Platanion. At the synod of Hiereia in 754, which proclaimed iconoclasm, he was anathematized, along with George of Cyprus and St John of Damascus; their memory was reinstated at the Seventh Ecumenical Council, the Second Council of Nicaea, in 787.

Germanos's literary oeuvre is in a confused state. Some sermons in honour of the Mother of God are his, as well as a certain amount of liturgical poetry, including examples of the newly fashionable "canons" (though it is difficult to know how much of this is genuinely his). From this it is clear that he had a genuine literary talent. There are also some letters, in which he defends the veneration of icons, which belong to his final years as patriarch. In his retirement he wrote a work *On Heresies and Synods*, which is an account of the (then) six ecumenical councils. Most other works attributed to him have been, or ought to be, ascribed to others, but there are two small but important works that are probably his: the oddly entitled *Church History and Mystical Contemplation* (which should perhaps be translated: "what happens in church and its hidden meaning"), and *On Predestined Terms of Life*, a significant example of a popular theological and philosophical genre concerned with the workings of divine providence.

Germanos's significance is threefold: as a stout defender of the veneration of icons against Leo III's iconoclasm; as a notable figure in the development of Byzantine devotion to the Mother of God; as an influential interpreter of the Byzantine liturgy. With St John of Damascus, Germanos represents the initial reaction of Byzantine churchmen to imperial iconoclasm. Although he does not have anything like the theological breadth and depth of the Damascene, he is clear in his repudiation of the iconoclast appeal to the second Mosaic commandment against the making of idols, drawing attention to the use of images in the ceremonial of the Jewish Temple, in his appeal to the Incarnation as inaugurating a new dispensation in which God has manifested himself in visible form, and in his repudiation of the emperor's claim to priestly authority in the defining of Christian doctrine.

In his sermons, and in some of his liturgical poetry, Germanos expresses a developed Mariology. The eight sermons that survive all have Marian themes: three are on the Dormition of the Mother of God, and another, on the *Akathist* hymn and the Dormition, celebrates the lifting of the siege of Constantinople on 15 August 718, the feast of the Dormition. Latin texts of the *Akathist* even ascribe one of the *prooimia* of the *Akathist*, *Tei hypermachoi strategoi* ("To you, Champion and Commander"), to Germanos, but it is probably at least a century older. In his praise of the Mother of God, he lays stress on her complete purity and the universal power of her intercession.

The *Church History and Mystical Contemplation* was to become an immensely influential commentary on the Eucharistic liturgy of the Byzantine Church. With some supplementation (mainly from St Maximos the Confessor's *Mystagogia*), it became a virtually official commentary on the liturgy, and was included in the first printed text of the liturgies of St John Chrysostom and St Basil, as well as in medieval manuscripts of the Slavonic service books. Every part of the church building, the sacred vessels, the vestments, the incense, the processions, and each event of the liturgy from the preparation through to the communion of the people: all are given a symbolic significance, the church building itself being both the temple of God and a miniature representation of the cosmos. The comprehensive decoration of the church with icons, which reached a settled form after the defeat of iconoclasm, finds its rationale in Germanos's understanding of the liturgical action.

ANDREW LOUTH

Biography

Born in the mid-7th century to a noble Byzantine family, Germanos was castrated when his father was executed for involvement in the murder of the emperor Constans II. Joining the clergy of Hagia Sophia, he became bishop of Cyzicus before being appointed patriarch of Constantinople in 715. He resigned in 730 when the emperor Leo III introduced iconoclasm. He wrote sermons and liturgical poetry, an account of the ecumenical councils to date, and an influential commentary on the Divine Liturgy.

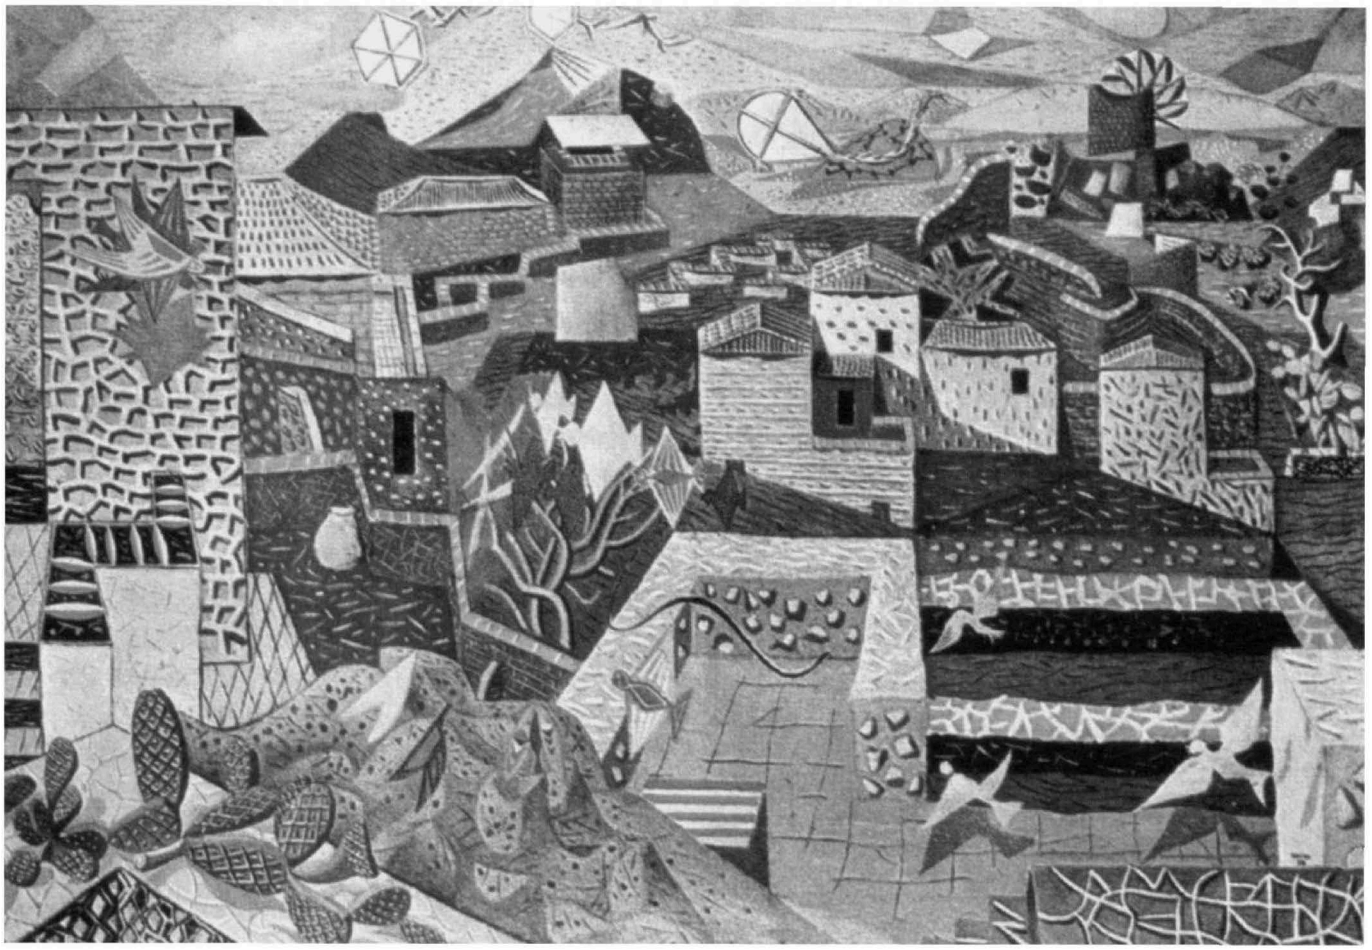
Ghika 1906–1994

Artist

Nikos Hadjikyriakos was the son of a naval officer, whose family from the island of Psara had participated in the War of Independence, and of Eleni Ghika, who was descended from the branch of the well-known Albanian family that had settled on the island of Hydra in 1628 and had contributed substantially to its uprising in 1821. He used his maternal family name when signing his paintings in Paris in the 1920s, and it was by this name, "Ghika", that he became known as an artist both in Greece and internationally.

Ghika's family tradition and his father's continued participation in military and political events weighed heavily on his cultural and artistic formation. The exceptionally talented, socially and financially privileged youngster had a few elemen-



Ghika: *Hydra*, 1948 – a Cubist composition depicting the artist's own island

tary private painting lessons with Constantine Parthenis before going to Paris to study Greek literature. He soon abandoned the Sorbonne for the Académie Ranson, however, where he studied painting for two years under Roger Bissière and engraving under Dimitris Galanis. Ghika effectively came to belong to what is loosely known as the École de Paris and his early work in France shows no trace of Greek influence or so-called traditionalism. His art derived its main precepts from Cubism and a post-Cubist vision of space and objects.

Ghika acquired a more distinct artistic identity and became deeply preoccupied with questions of "Greekness" in the arts following his return to Greece in 1934 and the repair of his maternal family house in Hydra. Some of his most important paintings date from the late 1930s and are landscape compositions based on the barrenness of the rocky island and angular motifs of Aegean architecture. "A cool Hydra breeze often blows in Ghika's atelier", wrote Elytis. "It comes down the deserted streets with the walls and the prickly pears, it hits the heavy relief doors of the island and ends up violet in the distance on the slopes of Dhokos and Hermione." Hydra remained the principal source of Ghika's work until his house was accidentally destroyed by fire in 1960. Some of his most important pictorial inspirations during the next decade came from the similarly barren landscape and linear architecture of the island of Santorini.

Indeed, Hydra and Santorini offered Ghika the ideal visual stimulus and inspiration for the application of the Cubist pictorial rules that characterized his artistic idiom. It is difficult to say whether the principal influence in this happy marriage was that of the Greek traditional and visual impact over the geometrical rules of Cubism, or the other way round. Perhaps Ghika's analytical and systematic thinking, as expressed in his various writings and interviews, makes one inclined to opt for the latter. In any event, it could safely be said that the post-Cubist characteristics of his art were fused into and absorbed by the Greek landscape, by traditional island architecture, and the all-pervading Greek light. Ghika's perception of harmony and rhythm was logical, i.e. humanistic in the ancient Greek sense. That was why he had adopted the language of Cubism, as he himself said:

> My compositions spring from the very rhythm and the very logical synthesis of the Greek landscape. The rock of Hydra and the island stone-walls were for me logical, rhythmical shapes. I stood reflecting and correlating Cubism with the Greek geometrical landscape. The roots of ancient Greek art, as in vase painting, were also geometric, and so was Greek architecture. Logic stood as my guide for the analysis and the reconstruction of Greek space through art.

Ghika applied Cubist pictorial rules to the Greek subjects of his paintings – mainly landscapes pervaded by the extraordi-

nary limpidity of Greek light: "Light here is *par excellence sui generis*," he said; "it shapes and searches the objects, it traces on the ground the exact confines between the illuminated and the dark." In this way he not only acquired a unique artistic idiom but he also effectively renewed the visual conception of "Greekness". By combining western modernity with Greek traditionalism he revolutionized Greek painting and art in general. Indeed, he gave it a completely new orientation, rejecting the predominant influence of the academic teachings of the Munich School. Despite the fact that he did not create a school of followers (he had only a few untalented imitators), Ghika's bold and progressive pictorial idiom opened the way for younger Greek artists to feel free to work in a modern idiom and, in the process, to harmonize Greek art with modern and contemporary artistic movements.

Ghika combined his admiration of ancient Greek civilization and art with a deep knowledge of mythology, history, and literature as well as the means and media of artistic expression. From the Cycladic to the Byzantine era, through the Minoan, the Archaic, and the Hellenistic, he studied the immense variety of art forms and tried his own hand at various techniques (e.g. encaustic) and materials. He once said: « I do not know of any other art of any nation that shows such development and visual multiplicity. For over four thousand years Egyptian art has remained substantially unaltered; and the same applies, to a great extent, to the art of India. » Yet Ghika did not blindly join forces with those who idolized antiquity with an uncritical eye; nor did he ever become totally identified with the so-called 1930s generation of artists who expressed the need for a return to Greek tradition. It was then that the merits of the naive painter Theophilos and of the Karaghiozis shadow puppets were rediscovered and that folk art and traditional architecture began to be appreciated, as the artists of the 1930s generation sought to redefine the character of contemporary "Greekness" by re-evaluating Greek tradition.

Ghika, however, searched deeper and refused to reduce the notion of "Greekness" to the elementary attributes of various forms of popular art. He refused to accept "simplicity" and "functionality" as the foundation of modern theories of art and architecture. As a close friend of Le Corbusier, he knew well about such conceptions, which he considered as having failed. He believed that perfection can be found in simplicity, as in the case of a sea pebble or a clay vase; but this is a totally different kind of perfection from that, say, of the flutes of a Doric column: that sort of perfection presupposes both sensitivity and knowledge. Furthermore, apart from his western cultural and artistic upbringing, Ghika was also interested in oriental art and philosophy (he practised yoga and painted while in India and Japan in the late 1950s) and he did not hesitate to introduce oriental elements in his own painting and sculpture. "My art is essentially Greek", he said, "but with the difference that I tried to create a link between Greek, European and Oriental elements; between elements which, irrespective of their provenance, contain something Greek." In other words, Ghika's "Greekness" was not nationalistic or provincial; it was a free-spirited continuous process of artistic enrichment, an attempt to combine apparently disparate artistic elements, always within the context of a wisely constructed classical synthesis.

Between 1935 and 1937 Ghika financed and published (mainly with his friends Pikionis, Papatsonis, Papaloukas, and Karandinos) the pioneering magazine *To Trito Mati* (The Third Eye). The avowed double aim was to arouse interest in popular Greek art and in the preservation of the Classical architectural heritage. "We failed in both", Ghika admitted later, but *To Trito Mati* gave the culturally somnolent Athenians an invigorating shock, with challenging articles on literature, poetry, philosophy, painting, sculpture, architecture, and mathematics. Almost 60 years later, Ghika still had "many loves", as he said: "painting, architecture, sculpture, literature, love, Greece, history. They are all equivalent for me and they influence each other." At the time of his death in 1994, however, he was disillusioned with the status and the future of the arts in Greece. "Greek society is incapable of appreciating the value of art and the average Greek is more attracted to football", he had said two years earlier. Nevertheless, that was the way it had always been (Egyptian priests had spoken in this vein about the Greeks to Plato, he recalled) and he knew well that football (or its various equivalents) is still far more popular than art, even in the most developed countries of the world.

Until the last years of his life, when his sight progressively deteriorated almost to the point of blindness, Ghika maintained a clean line in his drawing and neat colours in his painting, avoiding the excessive use of shading and chiaroscuro. His work can be divided into three periods: 1921–37, the period of youthful experimentation; 1938–65, the period of accomplishment; and post 1966, the period of maturity followed by progressive decline. Among his main preoccupations were the effect of light on landscape and on the surface of objects, the organization of his compositions, and the combination of straight lines and angles with curves and spherical shapes. Ghika was widely respected and loved, both in Greece and abroad. After 1960 he came to spend long periods of time in London with his second wife Barbara (née St John Hutchinson). He was a close friend of many important personalities in the history of 20th-century art, among them Zervos, Raynal, Laurens, Braque, Le Corbusier, Arp, Cartier-Bresson, Lawrence Durrell, Henry Moore, Walter Gropius, Henry Miller, and many others.

Biography

Born on Hydra in 1906, Nikos Hadjikyriakos adopted his mother's maiden name in the 1920s and was known as Ghika ever afterwards. Educated in Paris, he left the Sorbonne for the Académie Ranson in 1924. He exhibited in Paris from 1927 to 1934, when he returned to Athens. He was Professor of Drawing at the School of Architecture, Athens Polytechnic, in 1941–58. He is known primarily as a painter, but also as a sculptor, engraver, designer of theatrical sets and costumes, teacher, and writer on art. He died in 1994.

Glass

Glass is a man-made material of great versatility. It is made by melting together three main ingredients: soda, lime, and silica. In antiquity silica came from sand that also contained the lime needed to make the glass water-resistant, and soda came either from natron, which occurs naturally in Egypt, or, in the east, from saline plants found in the deserts and marshy areas. If nothing was added to the basic mixture, glass was naturally bluish-green; coloured glass was made by adding specific metal oxides and varying the furnace conditions. Colourless glass, akin to modern crystal glass, used manganese or antimony as decolourizing agents. It seems likely that in antiquity glass itself was made from the raw materials in only a few places, and shipped around as ingots to different glassmaking centres.

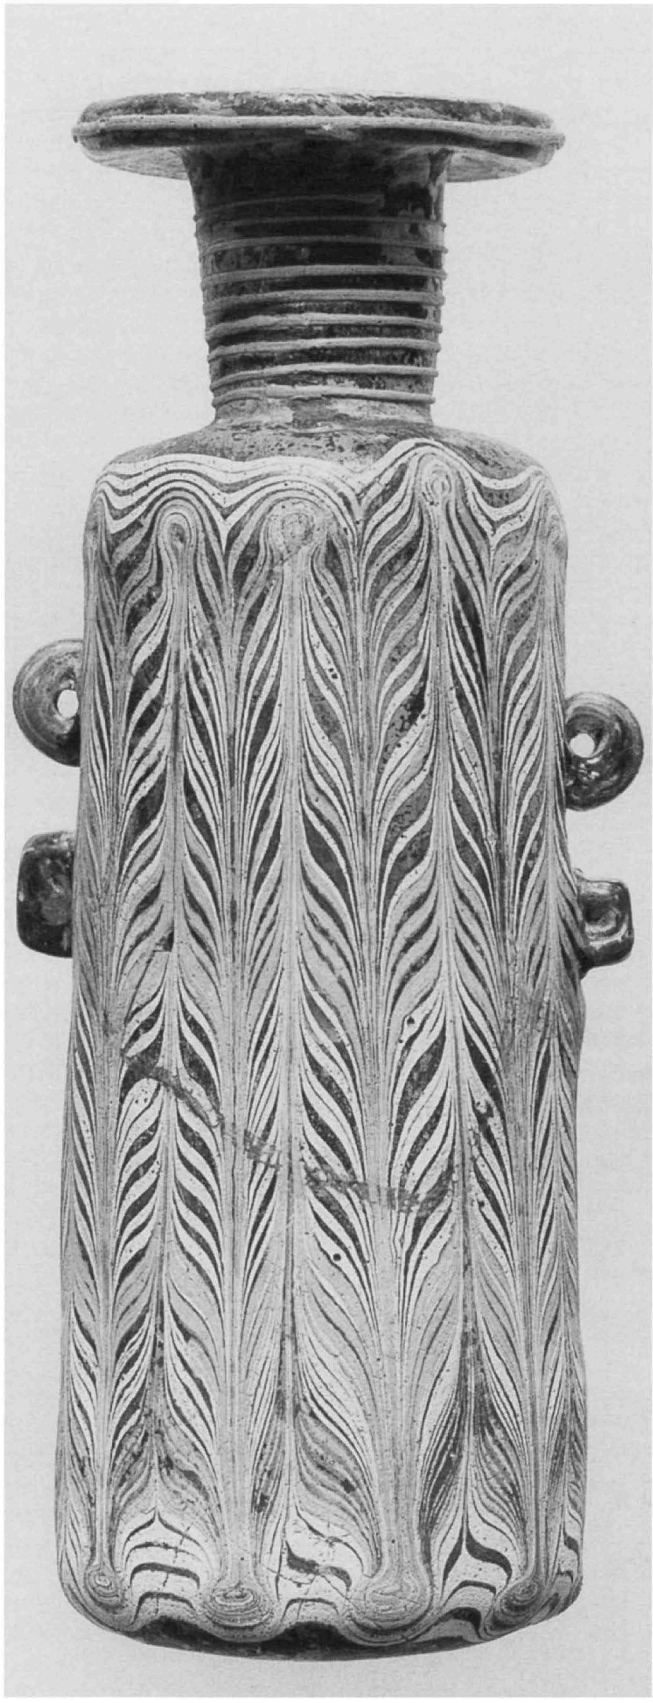
The first glass objects known are from Mesopotamia and date from around 2500 BC. A technological breakthrough some 1000 years later led to the production of the first glass vessels. This was the invention of core-forming, whereby glass was formed around a rod covered by a core of dung and clay mixed with a little water. Decoration was added by trailing soft glass of different colours around the body and combing it into patterns with a pointed tool. After subsequent reheating the shoulders, neck, and rim were formed and any handles added. The core-covered rod was finally removed after the vessels had been annealed (placed in a warm place apart from the actual furnace to cool slowly). The first vessels made by this method seem to have been produced in northern Mesopotamia around 1500 BC. The glass industry was born in Egypt not much later, but core-formed vessels were not produced in any great numbers before the time of Amenhotep III (1390–1352 BC). By 1450 BC Mesopotamian glassmakers were also forming vessels of mosaic glass, made by fusing together slices of monochrome glass or multicoloured canes that were then shaped around a core or, for open vessels, slumped over a form (positive mould). Early Mesopotamian and Egyptian glassmakers were also responsible for a great variety of objects, including pendants and beads of many different varieties. Diplomatic correspondence from the royal archives of el-Amarna, the new capital of Egypt established by Akhenaten (1352–1336 BC), mentions consignments of raw glass being sent from Tyre (modern Lebanon) and neighbouring cities. This speaks already for the importance of this region, credited by the Elder Pliny (1st century AD) with the invention of glass. The same area (the Levant) was responsible for a series of core-formed vessels.

Glass became known to the Greeks in the Late Bronze Age when documents in Mycenaean Greek call it *kyanos*. Imported Egyptian core-formed vessels have been recorded, principally from Cretan sites of the 14th and 13th centuries BC, while from mainland Greece, notably Mycenae and Kakovatos, come some Mesopotamian beads and pendants. The first items evidently made in Greece were a bowl with indented sides similar to metal and stone vessels, a tiny bull figurine, and a hilt for a distinctly Mycenaean type of sword, all of translucent blue glass perhaps of Mesopotamian origin (all three pieces are now in the National Archaeological Museum, Athens). Gaming pieces may also have been made locally. A series of ornaments is exclusive to Mycenaean Greece and evidently made there. Normally of translucent blue glass with flat backs and suspension holes, they occur in many different shapes, the most common being rosettes and spirals, the latter perhaps representing locks of hair. Most date from 1400 to 1200 BC. Moulds of stone, usually steatite, have been found on several sites, suggesting that there were a number of manufacturing centres. Ornaments of gold foil, quite often found with the glass examples, could also have been made in these moulds, the gold and glass sometimes fitting together. Some of the blue glass used by the Mycenaeans evidently came from Egypt, as illustrated by cobalt-blue glass ingots of evidently Egyptian origin that were discovered in the wreck of a merchant ship on its way to Greece that sank off the coast of southwest Turkey at Ulu Burun towards 1300 BC. Very similar ingots have been found at Tell Brak in northeast Syria (Mesopotamia).

In the earlier Iron Age the Greek contribution to the glass industry was a remarkable series of core-formed vessels, initially made principally on the island of Rhodes between about 550 and 400 BC. This Rhodian production was evidently inspired by Mesopotamian core-formed vessels found in 7th-century-BC contexts on the island. These may have been imported or possibly made by migrant Mesopotamian glass-workers. The Rhodian vessels were designed as containers for perfume or scented oils, which were Rhodian products of the time, and take their shapes from the contemporary Greek repertory of vases in pottery and metal. The most common body colour is translucent dark blue, but some are opaque white, brown, red, or olive green. Decoration usually consists of opaque orange, yellow, white, or turquoise trails combed into zigzag, festoon, or feather patterns. Traded far and wide, initially perhaps in the hands of Phoenician seafarers (residents of modern Lebanon), they reached every major site in the Mediterranean and also travelled as far as the Black Sea. Everywhere they are concentrated in areas of Greek commercial activity.

The Rhodian factories ceased production at the end of the 5th century BC and more than two generations passed before core-forming was revived in Mediterranean workshops. This occurred some time after 350 BC, coinciding with the conquest of the Persian empire by Alexander the Great. It marked the beginning of an era of Macedonian supremacy, and it seems likely that some factories were located in Macedonia and supplied northern Greece and Russia. Fewer vessels were now produced and many of the forms were more massive than before. New shapes included jars (*stamnoi*), three-handled flasks (*hydriskai*), and bottles (*unguentaria*).

By the 5th century BC the Greeks had two names for glass, one, *lithos chyti*, meaning "poured (or melted) stone", an apt description of the core-formed vessels. The second, *hyalos*,



Glass: perfume vessel in glass, the variegated colours enhancing the elegance of these dainty vases, Ashmolean Museum, Oxford

signifies "transparency" or "clarity". This could refer to 5th-century BC ornaments of clear yellowish and greenish glass in the shape of three-pointed stars and parts of palmettes and flowers, cast in clay moulds, and found in the workshop of Phidias at Olympia (now in the Olympia Museum). They were evidently drapery decorations, and different-coloured glass insets were used to enhance contemporary Greek architecture.

The second group of core-formed vessels has already brought the story into the Hellenistic period. During this time the glass industry generally flourished as never before, and the Greek world seems to have played a part in production. Excavations on the island of Rhodes revealed the presence of a glass factory operating in the late 3rd or early 2nd century BC making beads, and also vessels formed of two clear glass bowls fitted one inside the other with patterns in gold leaf attached to the outside of the inner bowl, thus appearing "sandwiched". The Rhodian finds are fragments, but more complete sandwich gold-glass bowls with known findspots come from Italy (four examples), Gordium (Asia Minor), and Olbia on the Black Sea. Rhodes may have been a centre of production of these magnificent vessels, but this is still debated. The Hellenistic period in glassmaking was marked by the production of fine vessels of mosaic glass, and finds from the Greek world show the familiarity of the people with such glasses, although it is still not certain where they were made. From graves at Palaikastro, near the town of Karditsa in Thessaly, come two very fine "bottles" of a particularly beautiful type of mosaic glass that imitates agate, a semi-precious stone, showing spiral patterns of white and purple in a brown ground. From another grave came a similar bottle of clear glass. These probably all date from the 2nd to the 1st century BC, and can be seen in the National Archaeological Musuem, Athens. This was the time that a new type of tableware made by the slumping process was being produced in profusion at sites on the coast of Syria and Palestine. Bowls of various shapes were made, usually hemispherical or conical with pointed bottoms and decorated on the inside with grooved lines. Initially they were of clear greenish or brownish or colourless glass, and later sometimes of green, amber, blue, or wine-coloured glass as well. Known as "grooved bowls", they were made with little variation for nearly 100 years between about 150 and 50 BC.

Around 80 BC a ship was wrecked near Anticythera off the southwest coast of Greece. Its cargo included colourless and mosaic glass vessels (National Archaeological Museum, Athens). Among the colourless vessels were two glass *skyphoi* (wing-handled cups), a bowl with bossed decoration, another of the fluted series, and one of similar shape with a finely executed engraved design. Bowls of mosaic glass, on applied ring bases, were hemispherical or had outward-curving sides, new shapes in the repertory. The mosaic pattern included spirals and a network pattern that had been introduced earlier, but new at this time was a true striped effect achieved by fusing together canes of different colours laid side by side (coloured band glass). Similar glasses to these have been found on the island of Delos (and now in the Delos Museum) in a context dating from 125 to 69 BC, together with deep "grooved bowls" of bright opaque colours, known in later contexts of the early to mid 1st century AD at Knossos in Crete (Herakleion Museum). Three small workshops making glass beads were also discovered on Delos.

Whether any of the glasses just described were actually made in Greece is perhaps unlikely, but probably of Greek or specifically Cretan manufacture were cosmetic boxes. These are made of thick glass, green, yellowish-brown, or colourless with a greyish tinge, and most with known findspots come from Crete. In form they compare rather loosely with marble and pottery examples, and the glass is similar to that used for finger-rings, some of which come from 3rd-century BC contexts. The glass cosmetic boxes are perhaps of the same date. The lid was made by the slumping process, while the box was evidently mould-pressed, using two shaped "forms" between which the molten glass was compressed, before being cooled and then cut, ground, and polished. Much of the tableware produced in Italy from the time of Augustus (see below) was made this way.

The discovery that glass could be blown revolutionized the industry. The first evidence for glass blowing comes from a collection of waste dumped in the Jewish quarter of the old city of Jerusalem around 50 BC (Israel Museum, Jerusalem), but blown-glass vessels did not become the norm for another 75 years. Thus in the late 1st century BC and earlier 1st century AD blown vessels are found alongside non-blown examples at Corinth (Corinth Museum) and in a grave group from Macedonia (National Archaeological Museum, Athens). The grave group includes five blown unguent flasks and a slumped shallow thin-walled bowl of a type made from about 25 BC to AD 25 in both brightly coloured and natural-coloured glass and recorded from all over the Mediterranean world. Many fragments of such bowls have been recorded from Knossos in Crete, but they were perhaps imported from Italy, where factories producing a fine series of tableware of monochrome brightly coloured glass and other vessels of intricate mosaic glass were certainly established in the time of Augustus (27 BC–AD 14). They seem to have supplied the Greek market, and to some extent to have reached Greek cities on the coast of Asia Minor as well. The same Italian factories were in part responsible for a series of bowls, often of mosaic glass, with evenly spaced ribs on the outside, known as "pillar-moulded bowls". The type seems to have originated in Syro-Palestinian glasshouses around 25 BC alongside, and in part preceded by, a series with less evenly spaced ribs. Both series are known from the island of Crete, but are rare on the Greek mainland.

Early blown glass, principally small bottles for perfume or oil, is known from the Greek city of Priene on the west coast of Asia Minor and the Greek island of Siphnos, as well as the sites noted above, suggesting that in the age of Augustus the blowing technique was rapidly being adopted in many parts of the Roman empire. Vessels from both eastern and western glasshouses also reached the Greek world in the 1st century AD and, since certain types are common to both areas, it is not always easy to decide their origin. Mould-blown glasses, first made around AD 25, mostly came from Phoenician and Palestinian glasshouses. Typical Italian types such as a large jug with embedded blobbed decoration from one of the Greek islands (British Museum, London), and small ribbed cups with coloured trails found in Crete, were also imported. Hemispherical cups, some with cut and abraded decoration, known from various sites in the Greek world, may also have come from Italy. An enamelled bowl from Greece (British Museum, London), which differs from the typical north Italian group in having a star rather than a rosette on the bottom, is perhaps from an eastern glasshouse that produced enamelled flasks known from sites on the Black Sea and on Cyprus.

By the end of the 1st century AD, when most glass vessels were blown and factories already established in the Syro-Palestinian area and in Italy increased their production, new glasshouses producing utilitarian glass vessels were established all over the Roman empire, no doubt including Greece, though actual evidence for Roman glassworking sites has yet to be revealed. Fine glassware was still imported. From Italy may have come tall beakers with facet-cut decoration recorded from Crete in late 1st- and early 2nd-century-AD contexts, and Italy may also have been the source of mould-blown square (and cylindrical) bottles that were produced from around AD 70 until the late 2nd or 3rd century, as well as jars, which were later used as cinerary urns, between AD 50 and 200. Bottles of the late 2nd century AD from Thermopylae and Corinth have short necks, restricted at the junction with the body, and cracked off rims, and are decorated with fine polychrome trailing. They may have come from a Syro-Palestinian workshop responsible for a series with trailed decoration of flowers and birds. A polychrome bottle of similar shape, but with a taller neck, from Karditsa in Thessaly is decorated with embedded yellow and white trails, and perhaps came from Italy where bottles of this type, but with cut decoration showing Italian landscapes, date from the later 3rd and 4th century. To the same years belong "pipette-shaped" bottles of a type current in both East and West and found on the island of Crete.

Our knowledge of glass of the early Byzantine period in Greece is limited. Roman traditions of glassmaking survived in the eastern Roman empire into the 7th century AD with most vessels being made of thinly blown glass in different shades of green as well as other natural colours. Excavations in Crete have revealed typical early Byzantine stemmed goblets and lamps, and a long-necked flask of the 6th century AD was found in a tomb near Athens. Two tombstones from Athens name glassworkers of the 6th century AD, and it is possible that at least one mould-blown jug was brought back to Athens by a pilgrim to Jerusalem about the same time (National Archaeological Museum, Athens).

By the end of the reign of the emperor Herakleios (610–41) Byzantine civilization was fully developed, but the role of Byzantium in the history of medieval glassmaking is still little understood. However, the products of the glassmakers of Greece, as well as other parts of the Byzantine world, must have played an important role in religious and secular art as well as in everyday life. The cargo of a ship that was wrecked off the coast of southwest Turkey around 1025 included three tons of broken glass vessels and glass cullet (glass fragments for a glassmaker to reuse), suggesting a flourishing trade in recycled glass. Excavations at a site in Constantinople revealed glassware of the 11th to 13th centuries. Predominant were wine glasses and lamps, similar in form to those of the earlier period, but made of fine-quality light blue-green to light bottle-green glass. There were also a few fragments of enamelled glass. The monk Theophilos, writing in Germany in the early 12th century, describes the making of glass goblets that the "Greeks" embellish with gold and silver, but by "Greeks" he simply means those living within the Byzantine empire, and so probably in the capital Constantinople, the most likely source

of fine enamelled glassware. "Greeks" are also described as being responsible for glass wall tiles with gold cruciform decoration made in much the same way as late Roman gold-glass roundels, evidently produced in Rome in the 4th century AD. This was one of the traditions inherited by the Venetians who were to dominate glassmaking from soon after the sack of Constantinople in 1204, though not until the middle of the 15th century did they produce works that could rival the Byzantine in quality.

Little glass of the later Byzantine period has in fact been found in Greece itself. In 1937 two glassmakers' workshops were discovered at Corinth on the site of the ancient agora. One was represented by fragments of furnace pots and debris, but no structures. The other was more complete and included knobbed (or prunted) beakers, of a type that was to dominate German glass production from the 16th century, cups blown in patterned moulds, beakers with vertical mould-blown ribs, and bottles with tall necks and globular or ovoid bodies (Corinth Museum). These products are similar to glass made in Italy in the 13th and 14th centuries, and it now seems likely that this glasshouse at Corinth operated at that time during the Frankish occupation of Greece. The glassmakers, therefore, may well have been Italian. Thus the influence of Byzantine glassmaking in Greece on the glasshouses of medieval Italy and central Europe was nil.

Through the centuries the Greek world had contributed in various ways to the glass industry. However, while local factories must have produced utilitarian glasses for everyday use in more recent years, no specifically Greek traits can be identified in modern glass, whether the mass-produced glass tableware or the hand-made artistic pieces that to this day are blown, just as they were 2000 years ago.

Gnostics

The term Gnostic is applied by early writers to a number of sects, all purporting to be Christian and to possess either a special revelation or a special understanding of the things revealed to others. These heresies were alleged to originate either with Simon Magus or with the Naassenes of Phrygia. Accounts of the former are largely fictitious, but the so-called Naassene Sermon, which assimilates Jewish and Christian beliefs to pagan mysteries in the course of a commentary on a hymn to Attis, is evidently genuine in substance, and of some antiquity (Hippolytus, *Refutation*, 5. 6–11). It finds the common theme of all religions in the oscillation of the human soul between the realms of spirit and matter, which are merely the upper and lower arms of a bifurcated stream. The Gnostics known to Irenaeus maintained, more pessimistically, that matter was wholly alien to spirit, and that the present world owed its origin to a schism in the Godhead, which imprisoned the divine Wisdom (or at least an offspring or reflection of it) in the underlying darkness. This myth was refined in the school of the Alexandrian Valentinus, which was probably not called Gnostic, either by itself or others, until the 4th century AD. The Valentinians held that even matter was an emanation of the fallen Wisdom, and that the task of the elect in the present world was therefore to liberate the soul from its gross environment, though not perhaps entirely from the body. In this they were helped by Christ and the Holy Spirit, who were brought forth from the fullness or *pleroma* of the Godhead in order to restore Wisdom to her previous state of knowledge. The elect in the present world are seeds of this repentant Wisdom, and the coming of Christ in human form delivered them from the bondage of the Law that the Creator had imposed upon the Jews. The somewhat earlier school of Basilides, another Alexandrian, appears to have taught that the present world is governed by the "third archon", who, in company with the elect, aspires to the spiritual condition of his superiors. The Neoplatonist Porphyry, whose master Plotinus attacked a group of Gnostics around AD 265, describes them as Christian heretics distinguished by the tenet that "the author of the cosmos is malign" (*Enneads*, 2. 9; cf. *Life of Plotinus*, 16). Yet this is not the teaching of either Basilides or Valentinus, both of whom ascribe to the creator a limited knowledge of, and share in, the goodness of the highest principle.

"Gnostic" is thus the name of a tendency rather than of a religion, and modern attempts to construct a unified faith called Gnosticism often rest on careless handling of the evidence. Nor is it true, on the other hand, that the Fathers themselves imposed the word promiscuously on every deviant movement; on the contrary, it was generally denied to those who claimed it, while philosophic Christians such as Clement of Alexandria were happy to apply it to themselves. It is even more tendentious to suggest, in the German manner, that the main Church was consistently opposed to a widespread principle of *gnosis* that was embraced by both the heretics and the pagan schools of the early Christian period; *gnosis* is nothing more than the Greek for "knowledge", which every creed and doctrine, including Christianity, declared to be its own prerogative. Many traits that modern theologians pejoratively characterize as Gnostic are of the essence of New Testament Christianity: the division between the substance of the Creator

and of his creatures is stronger in orthodox teaching than in Valentinian theory, and the propensity to allegorize the Old Testament was most common among those Christians who believed the whole canon to be infallible.

The testimony of sources from the early Christian era has been partly vindicated by a number of texts discovered at Nag Hammadi in Egypt in 1945. The Apocrypha of John and *Zostrianus* contain the tenets denounced by Porphyry and Irenaeus, but the Valentinian writings of the "Jung Codex" show that the sect was less unorthodox than the Fathers made it seem. The central myth is greatly attenuated from the so-called Gospel of Truth, the *Epistle to Rheginus* seems to affirm the resurrection of the flesh, and the Tripartate Tractate substitutes the Logos for Wisdom and traces the creation to divine benevolence rather than to error. There is much to be said for the view that all the Gnostic myths were conceived as allegorical or encoded presentations of beliefs that differed little from those of orthodox Christianity. Of all the great heresiarchs who are said to have maintained that the present world is the creation of a lesser God, Marcion was the one who dispensed with parables, and neither our ancient sources nor the majority of modern scholars regard him as a Gnostic. Critical reflection on the evidence has now dispelled a number of ancient calumnies: for instance, that the Gnostics were determinists, that they practised immorality as a ritual, and that they taught their pupils to lie as a means of evading persecution. When they write as though all human choices were determined by our natures, they are borrowing the idiom of the Pauline and Johannine writings; far from eschewing material sacraments, they seem to have accorded to them a magical efficacy, as we learn not only from the Gospel of Philip in the Nag Hammadi collection, but from Irenaeus' satire on the impostures of Mark the Mage. Many of the Nag Hammadi codices err not in the antinomian direction, but in that of the extreme asceticism that was known as the encratite heresy; for that reason it makes little sense to ask whether such a document as the infamous Gospel of Thomas should be classed as Gnostic, encratite, or a conflation of the two.

The Nag Hammadi codices give little support to the thesis of Rudolf Bultmann and Richard Reitzenstein that the Gnostic myths developed independently of the biblical tradition; in any case, these views were always known to rest on inferences from later Mandaean and Manichaean writings (some no earlier than the 9th century), together with a precarious distinction between indigenous and Hellenized Judaism. It would, however, be equally rash to deduce from the predominance of Old Testament citations that the authors of the new documents were Jewish rather than Christian; Christians might confine themselves to the Jewish scriptures either for apologetic purposes or because they did not yet possess a canonical New Testament. Similarly, the fact that some of the Nag Hammadi texts evince no trace of Christianity may imply that they were meant for a pagan audience, but says nothing of their provenance or date. Pétrement argues plausibly that the Valentinian teaching is a cryptic version of Pauline Christianity, and proponents of a non-Christian or pre-Christian Gnosticism are still looking for an adhesive that would unite their speculations with the facts.

MARK EDWARDS

Summary

Gnostics (derived from *gnosis*, "knowledge") were regarded as heretics by early Christian writers, for being members of sects purporting to be Christian but who believed that they possessed either a special revelation or a special understanding of the revealed religion. The recent discovery of Gnostic texts has partly vindicated this view but also shown that the sects were less unorthodox than the Church Fathers claimed.

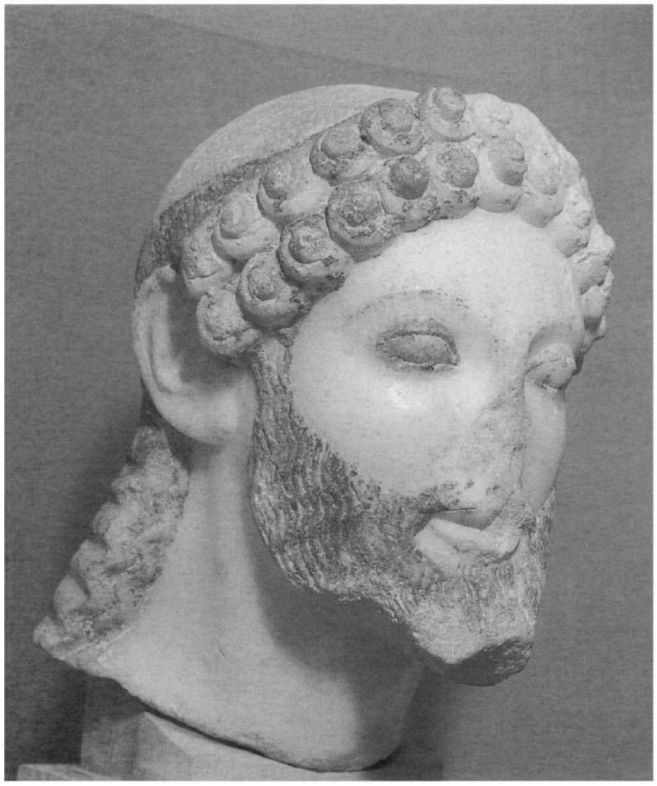
Gods and Goddesses

Ancient Greek religion was not only polytheistic, but also multifaceted, in the sense that there was an evolution in the notion of divinity. Even within the frame of specific divinities certain features changed with time. The crystallization of our notion of the gods and goddesses derives mainly from archaic poetry, and particularly from the Homeric and Hesiodic epics. The ambiguities and contradictions that are observed in the mythic narratives explain the multifaceted character of the ancient gods and goddesses. The ruling divinities were the Olympians, so called from Mount Olympus, which was believed to be their residence. Before them were some primordial beings. In Hesiod's *Theogony* the first beings were Gaia ("earth"), Chaos, Tartarus, and Eros. In the Hesiodic account the world was created essentially by Gaia, who gave birth to



Gods: marble head of Zeus, father of gods and men, from the Archaic period, 6th century BC

Uranus ("sky"), and then, mating with him, produced the 12 Titans, the Giants, and the Cyclops. Some myths are about the fear of losing power and the eventual succession among different generations of divine creatures. Uranus kept his children inside Gaia because he was afraid that they might take his power. Gaia, in order to be liberated from such a burden inside her, made a sickle, which their son Cronus bravely used to castrate his father. In the Hesiodic version the goddess Aphrodite was born out of Uranus' castrated genitals, which fell on the sea's foam. In Apollodorus' version Cronus was persuaded by his mother to kill his father because Uranos had overthrown the Cyclops, the first children he had with Gaia. Cronus, in his turn, swallowed his children out of the same fear that his own father had. He was defeated by his son Zeus, who after the Titanomachy and the Gigantomachy acquired supremacy. Cronus and Rhea had six children, three sons and three daughters: Poseidon, Hades, Zeus, Hera, Hestia, and Demeter.

The notion of 12 gods and goddesses was established early in the consciousness of the Greeks, but the catalogue of them varies. The most common list of the 12 consists of the following: Zeus, Hera, Poseidon, Demeter, Apollo, Artemis, Athena, Hermes, Ares, Aphrodite, Hephaestus, and Hestia. There were local variations according to which Hades or Pluto takes the place of Hermes, or Dionysus takes the place of Hestia. Besides the principal gods, there is also a group of minor deities such as the Graces, the Muses, Eros (not the Hesiodic primordial creature, but rather the son of Aphrodite), Hebe, Eileithyia, Hecate, Pan, the Nymphs, the Horae, Themis, the Moirae, Nemesis, the Erinyes, and others with different degrees of importance. It is uncertain how many were regarded as deities and with what specific role, and how they were worshipped. A general feature that is often pointed out regarding ancient Greek religion is anthropomorphism. Although they were believed to have power over nature and humans, the deities were subject to mortal needs such as food, drink, and sex. Political behaviour was not unknown among them and the Homeric epics present the gods as taking sides and making enemies even among their fellow gods. There is no representative of absolute perfection or absolute evil, but they were immortal, even though subject to mortal feelings as well.

Zeus was thought to be the father of gods and men. The expression "Zeus father" (Zeus *pater*) is equivalent to the Latin Jupiter. Besides the myths of succession that are associated with him, there are other myths related to his birth, the most common being the Cretan one. According to this myth the child was hidden in a cave on mount Ida so as not to be swallowed by his father, Cronus, and was nourished by the goat Amaltheia, while the Couretes danced around him and with their noise drowned his cries. Zeus was the god of weather and the one who makes thunder and lightning. Many of Zeus' Homeric epithets are related to his control of natural phenomena. He was notorious for his erotic liaisons that made him the father of many gods and heroes. By Hera he had Ares, Hebe, and in some versions Hephaestus and Eileithyia. By Leto, a Titaness, he had Apollo and Artemis. By Maia he had Hermes and by Semele, a mortal, Dionysus. In Homer he is also the father of Aphrodite by Dione. He gave birth to Athena, on his own, by swallowing her mother Metis. He was the father of Persephone by Demeter, of the Moirae, the Horae, the Graces, and the Muses. The most famous heroes claimed their descent from him: Heracles was his son by Alcmene, Perseus by Danae, the beautiful Helen by his daughter Leda. His many epithets are revealing of different emphases on various aspects of his divine identity in the mind of his worshippers. He is Zeus Herkeios, family protector, and also the protector of the domestic hearth (Ephesteios). As the god who soothes, especially at the end of the winter, he is worshipped as Meilichios. Freedmen used to worship Zeus Eleutherios in a sanctuary in Athens. As the ultimate lawgiver and bearer of justice he is Zeus Themistios.

Hera, daughter of Cronus and Rhea, was the sister and wife of Zeus. She is the feminine representation of natural forces, and the goddess of marriage and protector of women. In literature she is often depicted as the jealous wife who is constantly after her husband's lovers and offspring by them. In the Homeric *Hymn to Apollo* she delays the birth of Apollo and Artemis. Her persecution of Heracles is a beloved theme in literature and art. She is often referred to as Argeia, since Argos is one of the most ancient places of her worship, or as Zygia due to her patronage of marriage.

Demeter is another goddess closely connected with femininity, and particularly maternal powers. The evident etymology of her name ("earth-mother") has led to research into her relationship with the period of matriarchy in Greece. The main myth in which she features as a central figure is that of the quest for her daughter Persephone, who had been abducted by Hades. She finally finds her and makes the arrangement that Persephone will stay for some months with her husband in the Underworld, the mourning period for Demeter and winter for mankind, and for some time with her mother on earth.

Demeter was worshipped extensively at Eleusis, in the Eleusinian Mysteries in autumn time. The Thesmophoria was a widely celebrated female festival.

Poseidon is most commonly known as the god of the sea. Some of his Homeric epithets refer to him as the "earth-shaker". He was married to Amphitrite, but like his brother Zeus fathered many heroes. Some of his sons have monstrous features, like the Cyclops Polyphemus. He competed with the goddess Athena for the patronage of the city of Athens and lost. Athena, mostly known as the goddess of wisdom and prudence, is a multifaceted figure. She is the personification of feminine virginity combined with a warrior's virility. She was born from Zeus' head after he had swallowed her mother Metis; she therefore incarnates the *metis* (cunning intelligence) of her mother. Athena is an active participant in many myths due to her role as the protector-goddess of many heroes, such as Odysseus, Heracles, Perseus, and others. In Homer she fervently protects the Achaean side in the Trojan War, and accompanies her favourite Odysseus in the *Odyssey*. One of the most glorious ancient festivals, the Panathenaia in Athens, was dedicated to her. In Hesiod she is the one who teaches the art of weaving to Pandora, the first woman. One of her standard epithets is that of *ergane* ("worker"), revealing her relation with many women's works. An intriguing deity, she represents the ferocity of war and is easily recognizable in art by her attributes, a shield, spear, and helmet. She is also the guardian of peaceful community life.

Apollo and Artemis were twins, the children of Zeus and Leto. The first part of the Homeric *Hymn to Apollo* tells the adventure of their birth. Their mother was being pursued by Hera, and Delos was the only place that agreed to receive her; it therefore holds a central position for their cult. The second part of the Homeric *Hymn to Apollo* tells how Apollo came to be associated with Delphi, after killing a huge female serpent, Python. He was the god of divination and Delphi became the most famous oracle in antiquity. His epithet Loxias designates the oblique answers that he gave. He was also the god of medicine, healing, and music. In *Iliad* 1 he is the one who brings the plague. Apollo was also associated with the sun, hence the epithet Helios. He was the leader of the Muses, *Mousagetes*, and the patron of lyric poetry, particularly choric. Since he was the god so directly associated with mankind (through his link with medicine, music, and divination) he held a significant position in cult and was worshipped in many places, particularly Delos, his birthplace, where the Delia festival was celebrated every five years, and in Delphi, where there were many festivals, such as the Pythia and the Theoxenia. Artemis, Apollo's twin sister, was the goddess of hunting and represents untamed virginity. Unlike Athena, the other virgin goddess, she was not a city person, but rather dwelt in wild country, and was known as the lady of the wild beasts (*Potnia theron*). She was worshipped in many places, particularly in Sparta as Artemis Orthia. She was associated with many women's festivals, because she was worshipped with Eileithyia, the goddess who brought relief to pregnant women by granting them fast delivery.

There are two versions of Aphrodite's birth, the goddess of beauty and love. According to Hesiod (*Theogony*, 190–200) she belongs to the most ancient divine generation, before the Olympians ever existed, born from Uranus' castrated genitals that were combined with the sea's foam. In Homer her mother is Dione who mated with Zeus. Her epithets Kypria or Kythereia show her connection with the islands of Cyprus and Cythera, both claiming to be her birthplace. The same conflict arises regarding Eros, who in some versions is one of the primordial divinities, like Gaia, yet in most literary accounts and artistic depictions he is the son of Aphrodite and Ares, incarnating a warlike feature of passionate erotic desire. In Plato's *Symposium* Pausanias makes a distinction between Aphrodite Ourania ("heavenly"), and Aphrodite Pandemos ("of the people", "possessing a vulgar nature"). This difference has shaped the cult of Aphrodite and the reception of the goddess in religious terms.

Ares was the warlike god. Unlike Athena, he represents the passionate and irrational desire and insatiable thirst for war. The spear and the burning torch are his symbols. In Homer he is the lover of Aphrodite. He was worshipped everywhere, particularly in Sparta, Arcadia, and Elis. Hephaestus, associated with fire and artwork, is in Hesiod's version the son of Hera alone, and therefore, as a product of the female only, he is lame. He was the renowned maker of many wonderful objects of which extensive description (*ekphrasis*) is given in literature, such as the shield of Achilles in *Iliad* 18. In some accounts he is married to Aphrodite. He is associated with volcanoes, and was therefore worshipped in Sicily, especially near Mount Aetna, and the Lipari islands where he worked with the Cyclops. There was an annual festival in his honour in Lemnos, and in Athens the festival of Chalkeia in October. There was also a feast with the name Hephaestia.

Hermes and Dionysus were both offspring of Zeus, both involved in stories about coming to power. Dionysus' place of birth was Thebes. He was the son of Zeus and Semele, a mortal princess, the daughter of Cadmus. Semele, having fallen into Hera's trap, asked to see Zeus in all his glory, and was destroyed by lightning. Zeus took the baby Dionysus, who was born some months later from his father's thigh. The general consensus ascribes to Dionysus a Thracian or Phrygian origin. His cult was widespread in northern Greece and had an orgiastic character, adhered to particularly by women in a form that demanded religious ecstacy (*ekstasis*). Women were swept away by his divine nature and abandoned their life to join frenzied dances in the mountains, swinging thyrsi and torches. There are various artistic representations of maenads, as well as literary ones, the most famous being Euripides' *Bacchae*. Dionysus was popular as the god of wine and merriment, although wine does not seem to have had any significant role in the ancient orgiastic cults. The use of a mask was characteristic of his cult. The birth of drama is associated with the cult of Dionysus. The greatest theatrical festivals, the greater and the lesser Dionysia, were in honour of him. He was also associated with powers of fertility in nature, thus his most ancient representations consist of wooden images with the phallus as a symbol of fertility. The name Dionysus appears in Linear B tablets, which suggests that he was not unknown to the Mycenaean civilization. Hermes is another "young" god in myth, although probably quite old in origin. He was born on the Arcadian mountain of Cyllene and proved his characteristics of inventiveness, trickery, and versatility already from babyhood. The stories of the deception of Apollo by the baby Hermes who stole his cattle and of Hermes' invention of the

lyre are found in the Homeric *Hymn to Hermes*. He is associated with the notion of transgressing limits. He is the one who accompanies mortals to Hades, known for that as *psychopompos* ("escorter of souls"). He is also the messenger. Together with Athena he protects heroes in perilous enterprises and is often depicted in art escorting heroes. His characteristic attributes in art are the winged cap and the herald's wand. Much associated with Hermes is Hestia, the representative of home and family life; her name means "hearth". She was closely connected with Zeus, her brother. She took an oath of eternal virginity. She is the least anthropomorphic god of all and is never mentioned by Homer.

It is a commonplace to talk about the fusion between ancient and Christian religion. In some places, such as the southern Mani and remote islands such as Lesbos, popular attachment to ancient religion was so strong that total Christianization did not come before the 9th century AD. The struggle between paganism and Christianity was a common topic for writers on both sides. There is intense scholarly debate as to the relation between Hellenism and Christianity and the mutual influence of the one on the other. Despite many attempts by the Church to eradicate the practice of ancient religion it is still alive today in some folk customs and ideologies. The ancient gods and their spheres of influence have been fused with the cult of the saints: St Nicholas is the protector of seamen; a certain St Demeter was worshipped until recently in the region of Eleusis. Some saints have a specific role as healers or guardians against evil. As Martin Nilsson remarks: "Christianity easily swept away the great gods, but the minor daemons of popular belief offered a stubborn resistance." The belief in Hades, although no longer as the brother of Zeus and Poseidon, has many of the archaic elements that may be seen in Homer. Historians of religion and other scholars interested in great battles, particularly in the period of late antiquity and Byzantium, often take sides according to their personal beliefs and fail to see the periods in question with a sympathetic eye. As is often the case with languages, the mythology of ancient gods has not totally disappeared, but has left its remains in modern beliefs.

Gold

Although one of the major metals of antiquity, gold was not the first metal to be exploited, even for decorative purposes. This is probably because its extreme malleability made it unsuitable for making tools. The earliest regular use of gold dates from the 5th millennium BC (Neolithic) in Bulgaria, where containers of sheet and cast gold were found, with gold-dust decorated pottery vessels. Two different types of gold deposit were worked in antiquity – those in solid rock (primary deposits) and those in the sediments of rivers (placers). However, in both gold occurs as the native metal and smelting thus largely consisted of melting the separated metal.

Primary gold deposits are of many different types but one of the commonest is the vein deposit. Here the gold occurs as minute metallic grains in veins of white quartz typically up to a few metres wide, commonly with pyrite (iron sulphide or "fool's gold") and other sulphides. Such deposits form from hot circulating watery fluids. The fluids are very dilute and are usually associated with granitic intrusions or metamorphism. Gold deposits of this type were exploited in antiquity, but required much labour because the hard rock had to be crushed before the gold could be extracted.

Placer gold occurs as dust, grains, and nuggets in sands and gravels deposited by rivers. Such deposits form by the weathering and breakdown of the hard rock in which the gold originally crystallized. Lighter minerals originally present in the rock are slowly swept away by the flow of the water in the river, and the heavier minerals, including the grains of gold, are left behind. A placer miner will search for gold in parts of the river protected from the full force of the river current, such as downstream of large boulders or on the inside of bends in the river bed. The gold can be separated from the sand and gravel of the river bed by a number of different methods, such as pans and sluices, all of which mimic the sorting action of the river. Herodotus described gold extraction in the Phasis river (modern Rioni) of Georgia thus: "The mountain torrents are said to bring down gold and these barbarians catch it in troughs perforated with holes and on fleecy skins." This technique no doubt gave rise to the legend of the Golden Fleece. When a river changes course, its placer deposit will become "fossilized", but can still be exploited in the same way.

Although placer gold deposits are mostly produced by mechanical processes of alteration and sorting, there is also a chemical part to the process. Early writers on mineralogy were aware of this and spoke of gold nuggets "growing" in rivers. When a rock is weathered, most of the gold remains in the solid, metallic form, but some goes into solution in the water. In the river bed the chemical conditions are different and the gold in the water is plated out on to gold grains already present. This is why gold grains in placer deposits can be much larger than grains in rocks.

Gold has been mined in Macedonia and Thrace since the Bronze Age, but serious exploitation did not begin until Philip II gained control of the mines in 358 BC. Almost all the rivers in this area had some placer deposits, but most were exhausted in antiquity. About 300 tonnes of gold were extracted in Macedonia and Thrace between 1200 BC and AD 50. In recent times the Axios and Gallikos rivers north of Thessalonica have yielded the most gold. This placer gold originated in the

Gold: stalk of wheat in gold, from Ptolemaic Egypt, the source of most Greek gold, Sotheby's, New York

metamorphic rocks of the region. Some of these primary deposits were also directly exploited by the Thracians on Mount Pangaeum, where the gold occurs in quartz veins with pyrite.

There were several gold mines on the island of Thasos, and those near Kinyra, visited by Herodotus in the 5th century BC, were considered to be the most important. Much of the gold here, and on Siphnos, occurs in primary deposits of quartz veins with pyrite and copper sulphides. However, recently it has been found that the highest concentrations of gold on Thasos occur in sediments filling cavities in the marble host-rock. These cavities form by solution of the carbonate minerals in percolating rainwater, exactly as caves form in limestones. Streams that ran through these passages washed in the gold-bearing sediments to make these underground placer gold deposits.

The most famous ancient gold deposits of the Aegean region were those of Lydia. Exploitation of these very rich placer deposits of the Pactolus river started around 700 BC, but were exhausted by Strabo's time. The gold originated in quartz-gold veins in the metamorphic rocks to the south. Weathering liberated the gold, which was then transported by rivers and laid down in sandstones and conglomerates in the Gediz valley, some of which underlie the acropolis of Sardis. At a later time these rocks were again weathered and the gold redeposited in the beds of the present rivers. It is this two-stage process that gave the unusually high concentrations of gold here.

Much ancient gold used in the Aegean region was probably imported from Egypt. There it was first extracted from placer deposits of the Nile valley. Later, quartz-gold veins in the Eastern Desert were exploited, first from opencast and then from underground mines. Gold was also obtained from Nubia to the south (*Nub* means "gold" in Ancient Egyptian).

Although gold commonly occurs as the native metal, it is not usually pure, but alloyed with silver and copper. The silver alloy was called electrum on account of its colour, which was said to resemble that of amber. On occasion silver was deliberately added to extend the more valuable gold. This process was called *diplosis* ("doubling") by the early Egyptian goldsmiths. The gold content of such alloys was determined by the use of touchstones. These are small smoothed pieces of fine-grained, dark rock, hard enough to abrade gold. The gold was rubbed on the rock and the colour of the streak was used to determine the purity. The best touchstones were said to come from near Sardis, hence the synonym "Lydian stone". Many different types of rock were used, such as chert, siltstone, hornfels, and tuff.

Another impurity in much ancient gold is represented by minute grains of white metal of the platinum group of elements. These metal grains occur in serpentinites and are concentrated in placer deposits. The common presence of these grains attests to the importance of placer, as opposed to primary gold. Such grains could be a nuisance to goldworkers but were rarely removed.

The earliest attempts at refining were probably concerned with the removal of copper from gold. This can be done by heating the molten metal in a stream of air. During this process of cupellation the copper would be oxidized to form a slag. Separation of silver from gold was more complex. It was first developed at Sardis during the late 7th century BC. Electrum was mixed with salt and brick dust in a pot. The pot was heated for a long time without melting the metal, so that all the silver would be converted into chlorides and absorbed into the brick dust.

The Byzantines held gold in high esteem and used it as widely as possible, not only in its pure form but also in alloys with silver and copper. Gold was used for coins, medals, jewellery, and liturgical vessels. Further applications included the use of gold foil in mosaic, icon painting, and book illumination. Emperors dined off gold plates; and the ultimate seal of authority in Byzantium was the imperial *chrysobull* or golden seal.

Gortyn

City in Crete

The site of Gortyn lies 16 km inland from the south coast of Crete. Originally a Minoan settlement, it was refounded by Greek immigrants from Achaea, Thessaly, and Arcadia (central Peloponnese), followed by Dorians. From the 4th century BC Gortyn seems to have been involved in perpetual feuding with Knossos, each city striving for superiority over the other. When the Cretan cities became involved in war with Rome, Gortyn sided with the Romans in 66–65 BC and was rewarded by the victorious Quintus Caecilius Metellus with the title of *maxima civitas* and the position of provincial capital of the Roman province comprising Crete and Cyrene.

The early history of Gortyn is associated with the Gortyn law code of *c.*450 BC, found built into a wall of the odeum which was restored *c.*AD 100, though the inscription bearing the code may always have been visible. The code deals with a range of private legal matters, including family property, adoption procedures, slaves, mortgages, sureties, and donations. It reveals that slaves had certain rights, including that of permission to marry free women. Rape was a civil offence punishable by a fine, the amount depending on the status of the victim. A magistrate could use his discretion to decide whether a rape had been committed. This most important source of social and legal conditions in the Archaic–Classical period indicates the existence of a highly stratified society in which disputes over property rights and successions played a major part.

In the Roman period Gortyn continued to be the most important city in Crete. Christianity was preached early in the island. In the Pastoral Epistles Paul is represented as sending Titus to Crete "to set in order things that are wanting" and to ordain elders in every city (Titus 1: 5). Gortyn may have been one of these, for by *c.*170 AD we learn from Eusebius of Caesarea (*Eccles. Hist.* 4. 21 and 23) that Philip was bishop of Gortyn. He received a letter from Bishop Dionysius of Corinth praising him for his "many noble acts" and putting him on his guard against heresies. Gortyn had already won a good reputation which Philip was upholding against heresies, suggesting a relatively long-established Christian community there. Gortyn was the metropolitan see of Crete and the remains of seven churches have been found, including one dedicated to Hagios Titos, the presumed founder of the bishopric.

Exploration of the ruins of Gortyn up to World War I revealed the remains of a praetorium, baths, an amphitheatre, and circus as well as the Christian churches. The city, which covered an area of 150 hectares, was abandoned during the 7th century under increasing pressure from Arab raiders.

WILLIAM H.C. FREND

Summary

A city in central Crete, Gortyn was originally a Minoan settlement. It is famous for its law code (*c.*450 BC) which survives as an inscription on a wall of the odeum. In the Roman period it was the capital of the province of Crete and Cyrene. Christianity arrived early and remains of seven churches survive. Gortyn was abandoned in the 7th century AD.

Goths

Germanic people

Jordanes, a writer of the 5th century AD, gives a southern-Scandinavian origin to the Goths who migrated early in the Christian period to settle around the lower Vistula. Archaeological evidence, however, only supports a migration from the lower Vistula region to an area north of the Black Sea in the second half of the 2nd century AD. In 238 they began raiding the Roman empire, especially the Balkans, Asia Minor, and Greece. Victories by the emperors Gallienus (253/260–68), Claudius (268–70), who won the title Gothicus for his exploits against them, and Aurelian (270–75) largely ended the land and seaborne attacks, but only after one group (later known as the Visigoths) occupied Dacia on the left bank of the Danube, forcing Aurelian to withdraw Roman troops and administrators from the area. Out of an unknown number of groups operating under separate chieftainships, a second major group emerged and established a strong presence in the Ukraine. A large number of these Goths (later they formed the Ostrogoths) were absorbed by the Huns in the early 370s and only rose to prominence after the collapse of the Hunnic empire in the middle of the 5th century.

The westward advance of the Huns, and perhaps tribal conflicts, drove two groups of Goths across to the right side of the Danube into Roman territory, creating a chaotic situation that resulted in the battle of Adrianople (378). The resounding Gothic victory over the Roman army and subsequent devastation of the Thracian countryside temporarily shook Roman confidence but the Goths were unable to exploit their military superiority in any significant manner. The emperors Gratian and, later, Theodosius, realizing that a stable and peaceful Gothic people benefited everyone, arranged treaties by which the Visigoths were allowed to settle as federates with special status within Roman territory: in Pannonia (380) and in Lower Moesia (382).

The terms of the treaties were far from perfect but the Goths maintained peace with the empire until after the battle of the Frigidus river (394) where Theodosius' eastern forces engaged those of the usurper, Eugenius. Here the Goths fought for Theodosius under the command of their own chieftain, Alaric I (395–410), but were subject to other commanders who cared little for them so long as the battle was won. The eastern forces prevailed at a terrible cost to the Goths who had been thrown almost as fodder against the enemy. More than half of their 20,000-strong force was lost. Their enforced idleness the next year at Milan, Theodosius' temporary base, must have produced a tension-filled situation. At least this would help to explain why Stilicho, the commander at Milan after Theodosius' death (395), released the Goths, who then returned east only to discover that their Moesian homes had been raided by the Huns.

Alaric immediately marched his force to Constantinople where he obtained better terms for his people, including high military office for himself. The treaty was satisfactory enough to convince the Goths to depart but did not resolve their needs. Over the next 15 years, led by their king Alaric, the Goths devastated large parts of Greece and the Balkans in an attempt to stabilize their situation. Fighting for their own sake, they sometimes aided the eastern empire, sometimes the western empire. All was done to secure their most urgent objective: a safe and permanent territory for their people.

Before a year had lapsed since the signing of the treaty of 395, changes at Constantinople had made Alaric and his Goths outsiders once again. Moving southward through Greece, they ravaged much of Boeotia and captured the Piraeus. Athens only escaped their depredations by bribing the Goths to bypass the city as they moved southward into the Peloponnese where they remained for over a year (396–97). After a confrontation with Stilicho's forces near Olympia that came to nothing, Alaric moved his Goths first to Epirus and then into Macedonia where, according to a new treaty, territory west of Thessalonica, between the Haliakmon and Axios rivers, had been set aside for the Goths to settle as federates.

More than once during this time the Goths had been at a military disadvantage, but Alaric managed to extricate his forces by employing what must have been considerable diplomatic skills. No doubt, his group's potential as a powerful ally helped in negotiations with both the eastern and western empires, yet Alaric had forged a unified Gothic entity that could, and did, become a serious threat to those who would use them. The lack of secure territory for settlement and the desire to have their own high-ranking commanders within the Roman military structure compelled the Goths continually to break with their imperial allies. Eventually the quest to fulfil these needs led to the Gothic invasion of Italy in 401, which culminated with the sack of Rome on 24 August 410. After temporarily installing their own emperor in Rome, the Visigoths moved into Gaul and Spain where they finally established their own kingdom centred first at Toulouse (418–507) and then in Spain (507–711/725).

The Goths who had remained under Hunnic control until the death of Attila (453) and the battle of the Nedao river (454/5) established themselves in two rival groups on the right bank of the Danube. One group, subdivided under the rule of three brothers, settled as federates of the eastern empire in Pannonia. The other band settled in Thrace, nearer to events in Constantinople.

The most important of these Goths was the son of the chieftain Thiudimir, Theodoric, who was raised in Pannonia until the age of eight. His next ten years were spent in Constantinople as a hostage where he became acquainted with activity at the court and observed barbarian commanders of high rank. At the age of 18 he returned to his people, becoming the leader of the united Goths of his region in 474. The year before, these Goths had moved into Macedonia to establish a kingdom but this was a short-lived venture. No later than 476 they had returned to the Danube in Lower Moesia where they secured a kingdom centred around Novae-Svistov (Bulgaria).

About this time, in 475, the emperor Zeno was driven out of Constantinople, partly through the influence of the Thracian Goths under the command of Theodoric Strabo (son of Triarius), who now became the supreme commander of the imperial army. Theodoric, son of Thiudimir, quickly allied himself with Zeno against their rivals on the promise of increased status for himself and recognition of his Goths.

Now these two eastern Gothic groups came into direct conflict as they competed for the favour of the emperor who attempted to play them off against each other. The following years were filled with chaotic conflicts as the Goths of Theodoric moved across the Balkan peninsula and into Epirus (*c.*479/80) where they established a fourth kingdom. The accidental death of Theodoric Strabo in 481 ended the strife between the Gothic groups, who soon were amalgamated into the Ostrogoths under Theodoric's command.

With this large unified force, Theodoric represented a serious threat to the eastern empire. Greece suffered great devastation in 482 and was only spared further disaster when Zeno made a treaty (483) granting the Goths land and making Theodoric supreme commander and consul-elect for 484. By 487, however, the relationship between the emperor and Theodoric had deteriorated to such a point that the Gothic king led his forces to the walls of Constantinople, forcing Zeno to negotiate once more.

The strategic solution was to send Theodoric and his Ostrogoths against Odovacar to recover Italy. Theodoric set out in 489 and by March of 493 had undisputed control of Italy following his brutal murder of Odovacar and his family. His own kingdom briefly united the Visigoths and Ostrogoths (511–26) before it fell to Justinian's onslaught in the middle of the 6th century.

ANDREW N. SHERWOOD

Summary

The Goths were a Germanic people who originated in southern Scandinavia and settled in an area north of the Black Sea in the 2nd century AD. Driven west by the Huns, they defeated the Romans at the battle of Adrianople in 378. First accommodated and then slighted, the Goths under Alaric continued to harass Greece until 401 when they invaded Italy. These Visigoths (who later moved to Gaul and Spain) and the Ostrogoths (who remained in the east) remained a threat to the empire until the reconquests of Justinian.

Government, Theories of

The Classical approach to politics and government was concerned both with the institutional features of political regimes and with the question of the relationship between philosophy and government. The polis, the city state which presented the context for the development of that approach, was in many respects unique. From the perspective of the theory of government, the institutions of the polis can be illustrated by taking Athens as a model, since it was mainly Athens that provided the environment and the inspiration for political philosophy. The model, which was characteristic of Athens during the period of the city's greatest power, was based on the constitutional reforms of Cleisthenes (507 BC). Male citizens formed the Assembly (*Ekklesia*), the forum of direct democracy, which met regularly. The elected bodies were the Council of Five Hundred and the courts. But election to these bodies reflected a notion of representation very different from that which developed after the Middle Ages in Europe. The system of filling offices was a combination of election and lot: the townships (*demoi*) of Athens elected candidates and the holders of office were then chosen by lot from those elected. For the Athenians this system was democratic because it equalized the citizens' chances to hold office. The idea of citizenship was deeply participatory and left an unmistakable mark on Greek theories of government.

Political philosophy and the theory of government developed after the end of the Peloponnesian War and the defeat of Athens. The idealized account of the Athenian regime presented by Thucydides (in the Periclean Funeral Oration) emphasized both the civic commitment by the citizen and the confident and relaxed quality of life in Athens. The focus throughout was on the balance accomplished by Athenian political life between participation and freedom, public-mindedness and self-development. The civic greatness of the Periclean age was exemplified in a civilized way of life, in culture, and, characteristically, in the art of the 5th century BC. By contrast, the academic specialization of Athens came with the years of decline. Plato's Academy (385 BC) and, some 50 years later, Aristotle's Lyceum were founded in the aftermath of the humiliation of the model city state.

In the *Republic* Plato sought to define justice and asked whether justice can be found or created in the world of the polis. Plato's sublime exposition of his philosophical ideal in the *Republic* should be considered in conjunction with his account of "a half-way house between the actual and the ideal" (Barker, 1918, p. 183) in the *Laws*, written almost 30 years after the *Republic*. In the *Laws* an Athenian discusses with a Spartan and a Cretan the possible constitutional arrangements of government in a projected colony. Although there are also Spartan influences in Plato's thought, the Athenian model remains central in both positive and negative ways.

But the most important classical influence upon later theory comes from Aristotle, who was a member of Plato's Academy until Plato's death in 347 BC. Aristotle took over Plato's interest in political philosophy but approached its themes from a markedly different perspective. Aristotle's theory of political regimes in *Politics* proposes a classificatory model with three main types of organization of government: monarchy, aristocracy, and constitutional government. There are also three deviations: tyranny, oligarchy, democracy. Actual regimes vary, depending on the distribution of power according to rank and wealth. In addition to the analytical discussion in *Politics*, Aristotle undertook the empirical investigation of the operation of government in contemporary city states. These empirical studies, unarguably the first texts in the history of comparative political science, are lost, with the exception of the *Athenian Constitution*. Of equal significance has been the moral and political philosophy outlined in *Nicomachean Ethics*, a work of immense theoretical and methodological influence. For Plato the quest for truth was an ascent from mere opinions to the light of reality. There was an unbridgeable gap between the two. By contrast, Aristotle (and political science in the Western tradition since then) takes as a starting point common opinions in the polis, aiming to explicate and eliminate the inner difficulties which arise from an analytical consideration of these opinions. Regarding political methodol-

ogy, Aristotle made two main contributions. First, he established political science as a comprehensive social science on the assumption that its comprehensive character corresponds to the comprehensive character of the political community. Other communities (social, religious, and so on) are parts of the political community which regulates them for the common good. Second, starting from the assumption that the choice of method (and degree of exactness) will depend on the subject matter, Aristotle put forward a distinct method of political inquiry, arguing that the objects of political science rest on human convention not nature.

The centrality of Plato and Aristotle for the future development of the theory of government cannot be readily gauged from an examination of the schools of political thought that immediately followed the two great thinkers. The schools of the Epicureans and the Cynics, which began some 30 years after Aristotle, followed new lines of thought which centred respectively on the pursuit of happiness through avoidance of pain and anxiety and on protest against social convention. These lines (which, despite their differences, converged in their withdrawal from the sphere of political activity) were to become influential at a later stage, more so in western Europe than in Greece. In the latter the theory of government evolved in interaction with the kingdoms of the Hellenistic world beyond the Greek peninsula. The most important school of thought in the century that followed Aristotle's death, the Stoics, tolerated and occasionally defended the new monarchies, which were aiming at the integration of Greeks and people living in Asia. The theory of the deified king as a symbol of unity became influential throughout the Hellenistic world and was later partly adopted by the Romans. By the end of the 2nd century BC, however, Stoicism was revised by Panaetius of Rhodes. The revision was meant to recultivate Stoicism's moral philosophical content and in the process began to look back to ideas drawn from Plato and Aristotle. Panaetius worked on a humanitarian and universalist version of Stoicism, according to which justice is the bond that keeps polities together. In so far as a polity becomes unjust, it loses that basis of harmony which makes it a polity. This approach had great influence on Cicero and Roman legal theory, but it also signified a degree of adaptation of Platonic and Aristotelian concerns in the new context of a Mediterranean world which was becoming increasingly integrated economically and culturally (Sabine and Thorson, 1973, pp. 151–52).

Although the role of Roman legal institutions and norms remained significant throughout the years between the inauguration of the eastern capital in Constantinople in AD 330 and its fall in AD 1453, the prevalent model of government in the Byzantine empire combined elements of the deified king of the Hellenistic period and of eastern theocratic traditions. The result was a model that stressed the sacred character of the person of the emperor. Under Ottoman rule the Patriarch of Constantinople was granted the authority of the spiritual and political leader (*Millet Basi*) of the Christians. The role of the Orthodox Church was religious and supranational (ecumenical), that is, the Church guaranteed the institutionalized distinction between Christians and Muslims and was responsible for both the religious and the administrative guidance of the former within the framework of Ottoman rule. But the actual organization of government was complex, varied from region to region, and manifested a variable mix of influences by local notables, the Orthodox Church, and the Ottoman rulers. It must be stressed that Roman (Justinianic) law remained significant in many regions throughout the years of Ottoman rule, thereby providing an important normative thread alongside the other elements of continuity, notably linguistic and religious.

After the establishment of an independent Greek state in 1830 the building of political institutions became the focus of political debate and controversy. During the War of Independence there were declarations by the national assemblies in republican directions, but geostrategic realities, foreign influences, and domestic complications eventually led to the imposition of monarchy. After the 1830s it became evident that different sociopolitical factions championed different models of government. Those who wanted to initiate a process of state-building in the Western tradition pushed for a centralized state with strong executive and rationalized administrative structures. On the other hand, those who wished to retain the power of local notables had a preference for more decentralized governmental structures. At the level of political ideas, the Enlightenment exerted considerable influence on important intellectuals, but the power structure of the new state was based on a conservative coalition that proved inimical to the widespread acceptance of liberalism and human rights theories (Kitromilides, 1994). The establishment of the University of Athens, in 1837, contributed to the cultivation of a Western cultural environment, but its main objective was the training of personnel for the state institutions. In 1833 the Greek Orthodox Church broke away from the Patriarchate of Constantinople, and less than two decades later its status as a state Church had become clear. The weakness of liberal ideas in combination with the establishment of Orthodoxy as a state Church resulted in a persistent democratic deficit in the treatment of other religions (Pollis, 1988).

Despite the power of the conservative local oligarchies, the Western governmental model prevailed. But the state apparatus soon became dominated from within by the so-called *tzakia*, influential families whose origins can be traced to those local notables (*proestoi*) who had played a critical role during the War of Independence. By and large, the *tzakia* increasingly favoured a loose parliamentary model, since the latter, adapted to 19th-century Greek conditions, would simultaneously constrain the capacities and the reach of central authority and assist these patrician families to strengthen their role in the state, based on their local power resources and their extensive presence in parliament. In 1875 the king accepted the parliamentary principle in government formation, although parliamentarism had already been declared in 1844. The balance thus achieved survived until 1909, when the coup set in motion developments that favoured the ascendancy of liberal statesmen and the prevalence of liberal institutions. The formation of a differentiated and operational political system, a rationalized bureaucracy, and a professional army was a slow and difficult process, and it was not before the 1920s that the Greek state can be said to have acquired a modern structure of governmental authority.

The study of government in modern Greek political science and political theory grew out of the study of constitutional law. In this respect the institutions of the Second (1924–35) and the

Third Republic (1974–) have been important as points of reference for the evolution of constitutional theory. The latter remains in continuous interaction with the theory of government, even as the scope of inquiry widens and a number of factors, both domestic and "external", are brought in.

Four different approaches in the study of goverment can be distinguished, which incorporate partly different concepts of government. First, there is the approach which concentrates on the structure of governmental authority and the formal arrangements of the offices of government. This is typical of much work in the field before the 1970s and reveals the legal background of Greek political science. The focus on the formal institutions of government resulted in certain important contributions, along with some descriptive work. It is noteworthy that this approach often combined a legal lineage and an interest in analytical Greek political theory. For example, in this approach classifications of government still rely to a considerable extent on the Aristotelian typology of regimes. Second, there is the approach which examines the executive authority in the state. This signifies a constraining and sometimes confusing identification of government with the executive authority. Again, work that can be grouped in this category reveals a legal background.

The third and fourth approaches distance themselves from the constitutional-legal terrain. It is important at this point to stress that certain influential constitutional theorists in the early decades of the 20th century proved sensitive to the political and social dimensions of government (notably N.N. Saripolos and Alexandros Svolos). But the theory of government in these approaches remained for the most part constrained by its subject matter, the structure and operation of the constitutional edifice. The third approach, then, is concerned with the process of governing, including the various formal and informal aspects of policy making and the ways in which sociopolitical interaction influences and becomes itself influenced by political power. Finally, the fourth approach possesses a philosophical lineage and is concerned with the art of government, the criteria for assessing good government, and the relationship between government and moral values.

The conservative modernization drive of the late 1950s and early 1960s under Constantine Karamanlis was combined with the quest for a strong executive. One particular aspect of the Platonic theory of government, the view of guardianship, resurfaced in the conservative constitutional theory of the 1950s and 1960s (in the work of Constantine Tsatsos), reflecting the efforts to anchor the semiauthoritarian modernization drive in Greek political philosophy. In 1967 a coup installed an authoritarian regime, apparently aimed at blocking the possibility of a centre-left government emerging from the planned elections of that year. The regime tried unsuccessfully to institutionalize itself and collapsed amid foreign policy crisis and domestic upheaval in 1974, changing dramatically the contours of the theory and practice of government. The authoritarian potential in conservative rule having exhausted itself, the new equilibrium which was reflected in the 1975 republican constitution allowed the operation of liberal institutions, lifted the ban on the communist left, and sought to reorient the role of the army in the political system. However, elements of continuity with the situation before the coup were equally significant. The emphasis on a strong executive essentially represented a continuity from political strategies before 1967, only this time the organization of relationships between the head of state, the government, and the parliament revealed the influence of French semi-presidentialism. Also the regime change in 1974 did little to challenge the inherited corporatist structures which govern the participation of organized interests in the making and implementation of policy. The transformation of interest politics was gradual and took place in the 1980s and 1990s through the shifts, abandonment, or step-by-step revision of the structures of policy making and collective action.

Despite its opportunist aspects, the limited constitutional revision of 1986 reflected a shift in the balance of both practical politics and theoretical views. The revision's aim was to enhance further the role of the prime minister and to constrain the president of the republic, whose role became largely ceremonial. To some extent, the revision was consistent with the socialist (PASOK) analysis of the 1975 constitution as arming the president with extensive powers and distorting parliamentarism. But in the precise form it aquired, the revision expressed the immediate political concerns of the then prime minister Andreas Papandreou and the experience of cohabitation between Papandreou and Karamanlis. In this sense, it was an unnecessarily drastic reduction of the powers of the head of state; a more reasoned revision might have resulted in more efficient organization of constitutional relationships. In fact, the revision reflected the populist majoritarian thrust of the PASOK governments' policy in the 1980s. One aspect of that approach was the combination of the strengthening of the executive authority in the state and the promotion of further politicization of the administrative structures (Makridimitris, 1992). Another aspect was a certain impatience with elaborate institutional checks and balances. In this particular respect, A. Papandreou's approach to governing was not very different from the early disregard of Karamanlis for the static quality of intricate politics.

Government changed in both form (governmental and administrative structures) and content (policies) as a result of increased participation in the process of European integration since 1981. The theory of government traces the impact of convergence and Europeanization on policies, institutions, and rules of the game (Lavdas, 1997; Ioakimidis, 1998). Changes in the spatial organization of government have been studied more extensively, concerning not only the growth of local governments but, more importantly, the attempted regionalization of a country which (like Portugal or Ireland) had no inherited regional tiers of government. The emergence of new models of government is closely linked to the emerging pluralism of the centres of policy-making and the multiplication of policy actors at various levels: local, regional, national, transnational, European, global. The overall picture in the 1990s is one of a transitional, mixed, and segmented pluralism, where pockets of corporatist-interest intermediation coexist with pluralist arenas. The possibility of later (after 2001) Greek participation in the euro opens up a rich field of debate on how to approach government and democratic accountability in a multilevel decision-making framework in which European institutional building falls behind developments in monetary and economic unification. In a framework,

that is, in which government currently appears to follow economics.

Graeco-Turkish War 1897

The adverse impact of the 1897 war on the morale of the Greek nation and its delayed after-effects on Greek politics were certainly more significant than the event itself which commenced on 27 March (Old Style; 8 April New Style) 1897 and was terminated with the 7 (19) May armistice of that year.

This accidental conflagration was the undesirable byproduct of an irredentist ideology that had become the hallmark of Greek foreign policy throughout the 19th century. Between 1844 and 1897 Greece pursued its irredentist guerrilla warfare against the Ottoman empire with native irregulars or soldiers of fortune from Crete and Macedonia. Brigand groups were on many occasions granted pardon if they volunteered their services to the patriotic cause.

The culprits responsible for inflaming public opinion on the side of confrontation included the press, the political parties, the government of Theodoros Deliyannis, and the royal family. The most pernicious influence came from a clandestine organization bearing the name the "National Society", founded by young army officers in November 1894. A year later prominent civilians were admitted, but until early 1896 only eight out of 130 members were not officers. It was after the spring of that year that a stream of well-known Athenians began to enter the society.

In spite of the patriotic sound and fury, however, the morale of the Greek officer corps on the eve of the war was sagging. The 1893 default of Greece on its external debt had diminished the military budget from close to 59 million drachmas in 1895 to less than 20 million eight years later. The irredentist fever that seized the country in 1897 was certainly not compatible with the prevailing austerity in public finances. Nevertheless, in January 1897 the Cretans defied Ottoman rule and proclaimed their unification with Greece, while the latter responded by sending a small expeditionary force under Colonel Timoleon Vassos to their rescue. Although the naval forces of the great powers (with the exception of Britain) blockaded the island, Greek public opinion demanded of the government to stand by its decision to annex Crete.

The National Society played a pivotal role in pushing prime minister Theodoros Deliyannis over the brink. The episode that unleashed the dogs of war was the incursion of 3000 Greek irregulars into Ottoman-held Macedonia at the end of March. On 5 April the Sublime Porte severed diplomatic relations with Athens and declared war. From the outset hostilities erupted on two fronts, in Epirus and in Thessaly. The performance of the commander-in-chief, Crown Prince Constantine, left much to be desired. One week after the skirmishes commenced, the Greek forces retreated in disarray.

On 12 April the Turks captured the Thessalian city of Tirnavo, and on 13 April they entered Larissa. Between 14 and 24 April the decisive battle of Velestino was fought and lost by the Greek army. On 26 April the vital port of Volos was taken by the Ottomans and on 5 May the last battle was waged in Domokos.

The Ottoman army, superior in numbers and organized by German officers, found no match in the diminutive Greek forces. Faced with the imminent threat of collapse, Greece hurried to an armistice on 7 May. The peace terms, however, were lenient and, thanks to British intervention, no territorial losses were incurred by Greece. However, since the war indemnity of four million Turkish pounds to the Ottomans could not be paid by an insolvent state, Germany proposed that Greek finances be controlled by an international finance commission,

which would also supervise the servicing of Greece's external debts.

Surprisingly, the apple of the particular discord, Crete, was granted complete autonomy and in 1898 Prince George, the second son of King George I of the Hellenes, became High Commissioner of the island.

One year after the first modern Olympic games, which were held in Athens, the self-esteem of the nation, elevated to heights of romantic delusion, plummeted to the depths of pessimism. The 1897 debacle obliged Deliyannis to step down from the premiership, an attempt was made against the life of King George, and members of the royal family were castigated by the press. Literature and poetry, in hot pursuit of 1897, produced works of despair, anger, and satire. The sarcastic verse of George Souris left neither the royal palace nor the exponents of the war unscathed, while scores of melancholy novels were based on the traumatic event. It was only in 1902 that the poet laureate, Kostis Palamas, with his *Flute of the King*, dared to revive the hope of national resurrection after the humiliation of 1897.

Grammar

The term "grammar" comes from the Classical Greek *grammatike techne* (later abbreviated to *grammatike*), which simply means "skill of writing" (Greek *gramma*, "alphabetic character", "writing"). Accordingly, the *grammatikos* was someone who knew the alphabetic characters, who was able to read. In Hellenistic times *grammatike* progressively took on the meaning of "linguistic and literary studies", i.e. the present sense of "philology". This was a result of the influence and development of various intellectual movements. Consequently the term *grammatikos* stood for a professional philologist, someone who was concerned with textual criticism and the interpretation of Classical works. In Late Antiquity a semantic narrowing occurred: grammar was now simply understood as phonology and morphology, which still form the central field of grammar. The Romans adopted the terminology together with the contents. The loan translation *litteratura*, however, was not applied in this field, whereas the Greek loan word (*ars*) *grammatica* passed as a technical term into most European languages.

In antiquity the systematic scholarly exploration of language and the development of proper grammatical terms were the work of philosophers. Although they were simply considering their own language and not doing any comparative linguistics in a modern sense, the Greeks nevertheless managed to create a terminology that is still in use by observing and compiling linguistic facts and arranging them into different fields. The first philosophical discussions about language date from the time of the Sophists (5th century BC) with a focus on the relation between word and object. Rather casually, philosophers also touched on grammatical topics: they distinguished for instance three genders of the noun. Plato's *Cratylus*, in which he deals thoroughly with linguistic problems, offers the basics of phonology. Alphabetic characters are distinguished according to vowels and consonants, and words are analysed in syllables. Syntax is also addressed in addition to morphology; for the first time the denotations *onoma* ("noun"), and *rhema* ("verb"), are explicitly introduced as parts of speech. The terminology was taken up and partly refined by Aristotle. He explained that conjunctions and particles are also parts of speech, as are articles and demonstrative pronouns. In his writings we find the technical term *ptosis*, ("case", "inflection"), for the first time as a designation for all morphological variations of word forms, i.e. not only nouns but also verbs. His terminology was extended and concretized by the philosophical school of the Stoa (from about 300 BC), who established grammar as a scholarly field of its own. As to phonology, the Stoics defined a set of 24 alphabetic characters as "elements of words" and they distinguished seven vowels and six consonants. As to morphology, they examined the inflection of nouns and verbs. Moreover, the tenses and gender of verbs were systematically described. In the field of syntax they explained constructions of active and passive voice, and also the role of the nominative and oblique cases. Etymology was particularly studied, as it had been by Plato. Although they pursued it with true passion, the results were obviously rather naive from the perspective of modern linguistic knowledge. The numerous irregularities in word formation and use were interpreted by Stoic philosophers as following from a principle of anomaly prevailing in language. Their method was purely descriptive: they merely stated facts but refrained from finding reasons for inconsistencies.

Grammarians of the Hellenistic period, by contrast, above all the Alexandrians (*c.*2nd century BC) who were leaders in philology at that time, tried to put regularities of language in the foreground, considering irregularities as deviations from normality. Their basic principle of explanation, which they called analogy, has predominated ever since. This method had another starting point: whereas the Stoics proceeded from logical assumptions, Alexandrian philologists dealt with grammar for practical, i.e. didactic, reasons. As Greek civilization spread in the Hellenistic period, they tried to provide tools for non-Greeks to learn Greek language and literature. Morphology especially was understood as a system of analogies. Groups of identically inflecting words could be distinctly classified by corresponding rules so that patterns of declension and conjugation were set up and, at the same time, irregulari-

ties were registered. This method was also purely descriptive. The first systematic description of phonology and morphology was compiled by Dionysius Thrax (*c.*100 BC) under the title *techne grammatike* ("science of grammar": syntax, defined as the composition of words in a sentence, is mentioned but not treated in detail). This work was the first grammatical manual for didactic purposes and consequently achieved wide circulation. From about the 4th century AD it was regarded as a standard grammar for Greek, forming a basis for further research throughout the Byzantine period and up to the Renaissance. Dionysius defines grammar as the "knowledge of what is normally said by poets and prose writers". His work is divided into six parts: reading aloud, explaining literary expressions, commenting on words and knowledge, etymologies, finding regularities, and finally literary criticism. From his explanations it becomes obvious that the eight parts of speech (noun, verb, participle, article, pronoun, preposition, adverb, conjunction) are determined by the sentence as a whole and, consequently, considered as (relative) parts of the sentence. The order of enumeration is intentional: the most important parts of speech, noun and verb, are named first. This is in accordance with linguistic and philosophical reflections from the past, where these two elements were already regarded as determining a sentence. Moreover, the first five word classes are inflectional, the last three are not. Dionysius' classifications and terminology were adopted by Roman grammarians. They adapted the system to the Latin language, also translating technical terms into Latin. These still survive (for instance *ptosis* = *casus* = "case"). Apollonius Dyscolus (2nd century AD), basing himself on the Stoics and on Dionysius Thrax, dealt extensively with syntax in a way that was quite subtle for his time. He defined syntax as a combination of words considering the coherence of the whole sentence. He illustrates the central position of noun and verb in a sentence by remarking that a sentence will become senseless or at least indefinite if these two elements are omitted. He also wrote special studies on pronouns, adverbs, and conjunctions. Furthermore, he introduced the terms transitivity and intransitivity (in relation to verbs). With this grammarian, the separation between grammar and philology was fulfilled, so that the development of an independent discipline could begin.

In the Byzantine period, as the spoken everyday language and the Classicist literary language progressively separated, gradual linguistic changes also modified the demands that were made on grammar. Having been merely descriptive in the Classical period, it now became prescriptive with rules for correct pronunciation, orthography, inflection, etc. Although colloquial language developed in a very dynamic way over the centuries, only the Atticizing language was described in grammars. In the highly developed educational system material was needed both for elementary and for higher instruction in order to explain the language of literature and to assist the reading of classical authors. Thus, numerous commentaries on and compilations of earlier grammatical works exist. The so-called *epimerismoi* became very popular for instruction. These are comments on Classical writers (above all Homer) and on religious texts (e.g. the Psalms), partially written in the form of question and answer in order to underline the didactic purpose. In these Byzantine grammatical writings word-for-word explanations concerning phonology, orthography, prosody, and morphology are in the foreground, while analysis of syntax is only treated marginally. From the 11th century a new technique called *schedographia*, related to that of the *epimerismoi*, comes into fashion. These are small exercises in prose (sometimes mixed with introductory verses) in combination with moral instructions. They were used to practise and apply grammatical rules. This method, however, was controversial among Byzantine intellectuals, since it was overemployed and commercialized by some grammarians so that it was no longer serious.

Michael Synkellos (9th century) was famous for his work on syntax. He is the first grammatical author since Antiquity to devote himself exclusively to this topic. His starting point is the isolated word and not so much the mutual relationships of words in sentences. He treats different verbs and prepositions and corresponding case constructions at length, interlarded with numerous examples. His work is a short and clear manual with instructions for the correct use of language rather than theoretical reflections. On the whole, Byzantine authors concerned with linguistic and/or grammatical problems were not conspicuous for their innovative tendencies or originality. Ideas that came from Antiquity and Late Antiquity were taken up again and again, annotated, and, at best, slightly added to. An exception is the versatile scholar Maximos Planudes (13th/14th centuries) who, within the framework of his works about syntax, developed a theory that may be traced back to Antiquity and the Hellenistic period: the so-called localist theory of case (this, however, being the modern term). Planudes explains that there are three interrogatives asking for the most important parts of speech, i.e. the three oblique cases: "whence" (genitive as the case of origin), "where" (dative for location), "whither" (accusative denoting destination). Greek prepositions governing all three cases demonstrate this theory in a very clear way. The localist point of view in the interpretation of case systems was and still is in use by linguists of the 19th and 20th centuries.

In the 14th and 15th centuries several scholars taught classical Greek in the Latin west, especially in Italy. By so doing they initiated a revival of Greek studies in western Europe. Manuel Chrysoloras, for example, gave lessons in Florence and wrote a grammatical treatise in the form of questions and answers, a method that had been popular since the 12th century. His grammar presented the Classical language of literature (phonology, morphology, syntax) in a vivid manner, with little theory, and it was meant as a practical guide for those who wanted to learn Greek as a foreign language.

The *Introduction to Greek Grammar* by Theodore Gaza (15th century) is probably the most comprehensive grammatical treatise of its time. In addition to orthography, phonology, and morphology, Theodore also devoted a whole book to syntax. The influence of this work was also very great in the Latin west (Erasmus of Rotterdam translated parts of it into Latin). The book was reprinted frequently up to the 19th century.

After the conquest of the Byzantine empire by the Turks many Greek intellectuals fled to the West. One of them was Constantine Laskaris who in the second half of the 15th century worked as a teacher of Greek in different Italian cities. He wrote a Greek grammar, a *Collection of the Eight Parts of Speech*, which in 1476 was one of the first books to be printed entirely in Greek types.

During the Tourkokratia new literary centres were formed outside the Ottoman sphere of influence (Cyprus, Rhodes, Crete, Ionian Islands) in which a daily spoken, popular language, with specific dialectal features, could flourish. At this time descriptions of the current language were gradually developed. The oldest grammar of vernacular Greek is by Nikolaos Sophianos of Corfu (16th century). Girolamo Germano, an Italian who lived in Chios for some time in the 17th century, presented a few grammatical observations as a preface to his Italian–Greek glossary. Simon Portius (17th century) adopted some of Nikolaos's thoughts in his grammar of vernacular Greek written in Latin.

A growing feeling of nationalism among the Greek people, together with the political independence that followed in the 19th century, resulted in the ambition to achieve a homogeneous (modern) Greek language for daily use above regional variations. Out of these attempts, however, different movements developed. Two directions emerged in the course of time that determined the further development of the Greek language down to the 20th century: *dimotiki*, popular language, and *katharevousa*, purified learned language. Accordingly, language manuals and grammars were also coloured differently. With the rise of historical and comparative linguistics towards the end of the 19th century, grammars were increasingly written from the perspective of diachronic linguistic study, i.e. as scholarly treatises rather than school grammars. Examples include the works of Yannis Psycharis (with emphasis on *dimotiki*) and Georgios Chatzidakis (with emphasis on *katharevousa*). In the 1950s André Mirambel wrote a comprehensive analysis of the modern Greek language (phonology, morphology, syntax, vocabulary, stylistics) taking into account both directions of the Greek language.

Great Idea

The *Megale Idea*, or Great Idea, was the central programme of Greek nationalism in the 19th century. The programme was often vaguely defined and shifting in its emphasis, but its general thrust was irredentist. The Great Idea envisioned the unification of all the Greeks of the Ottoman empire within the borders of a Greek state.

This programme grew out of the disappointing outcome of the Greek revolution of 1821. The revolutionary leaders had aspired to the liberation of all Greeks from Ottoman rule and the replacement of the sultan's rule with some sort of Hellenic authority. The expected borders of this new state were never clearly defined, but they were certainly much larger than those of the Greek state that actually came into being. By the time the treaty of 1832 was signed, regularizing Greece's position in the international community of nations, the new state occupied only the southern tip of the rocky Balkan peninsula, as well as a few Aegean islands. This out-of-the-way area had always been a marginal one within the context of the Ottoman empire as a whole, and it was not an important centre of Hellenism when compared to Constantinople, the west coast of Asia Minor, or the Danubian principalities. The population of the new state was roughly 800,000, no more than a quarter of the total Greek population in the Near East.

The political leader John Kolettis is often credited with the formal articulation of the Great Idea during his speech to the Constituent Assembly in January 1844. But irredentist aspirations were part of Greek political discourse from the very beginning of the kingdom's existence in 1833. At the first celebration of Independence Day (25 March) in 1838, the slogan "To the City!" (Constantinople) spread like wildfire. When sultan Mahmud died a year later, the expectation was high that king Otho was about to depart for the Ottoman capital where he would be crowned emperor. According to a Greek historian writing in the 1860s, he was only prevented from doing so by the fact that the kingdom's one steamship was under repair. Even earlier, in 1834, Kolettis had argued that Greece should not declare a formal capital city, since the real and only capital of the Greeks was Constantinople.

Kolettis's argument brings up the principal interest of the Great Idea for the history of modern Greece. The Great Idea was never seriously pursued in Greek foreign policy, except during the exceptional circumstances of the immediate post-World-War-I years. Greece was far too weak, and Europe far too hostile, for the Greeks to be able actively to pursue the extension of their borders at the expense of the Ottoman empire. Shifts in the international situation did, however, affect which aspects of the Great Idea were emphasized and which downplayed.

The Great Idea was much more important in domestic politics, helped along by the fact that there was virtually no dispute over its validity, just a debate over how best to translate it into actual policy. The policy question was essentially this: given that the national project had been arrested almost at the start, what was the place of the Greek kingdom in the larger framework of the national question, and how should it conduct itself? As John Petropoulos put it, the Greeks simultaneously held two totally different conceptions of statehood. On the one hand, it was felt that Greece, as a new member of the European family of nations, should regularize relations with its neighbours, concentrate on internal development, and, in general, settle down to peaceful pursuits. This was the idea behind the rhetoric of "the model kingdom". The pursuit of a "model kingdom" had the added virtue, according to its advocates, that a prosperous and peaceful Greece would be sure to retain the loyalty of all the unredeemed Greeks living in the Ottoman empire, and would attract the support of Europe as well. Radically opposed to this vision of the state was the conviction that the Greek kingdom was no more than a kind of "temporary and makeshift military base from which the already redeemed Greeks must carry on the national crusade on behalf

of their unredeemed brethren", in Petropulos's memorable words.

Given the universal popularity of the Great Idea, it is not surprising that it was frequently enlisted as a tool in the ideological battles between liberals and conservatives that racked Greece from the very beginning of its national existence. In general, the liberals pulled more strongly in the direction of the "model kingdom" view of the Greek state. They were fervently committed to the development of a Western-style state in Greece, and had little love for the backward, as they saw it, institutions, such as the patriarchate, that were still so important in the Greek communities of the Ottoman empire. Their version of the Great Idea, then, saw the extension of the borders of the Greek kingdom to include all of the Greeks of the Ottoman empire. That way the Greeks would be not only united, but united under the aegis of a state that was properly Western in its orientation. Conservatives, on the other hand, could often barely disguise their scorn for the Western-style reforms that had been imposed on Greece, in their view, by a culturally alien West. The whole point of the Greek kingdom was to help the Greeks regain their ancient capital, Constantinople, where they would resurrect something like the Byzantine empire. These battles, of course, harked back to the revolution of 1821 and even the 18th century.

The Great Idea had a way of erupting into every policy debate in 19th-century Greece. Differences over the nature of the Great Idea were exposed in the 1830s debate on the place of the Church in the new kingdom of Greece. For liberals, it was self-evident that the Church in Greece should be autocephalous, that is, independent of Constantinople (which it did become), because the revolution had been almost as much against the patriarch as it had been against the sultan. It was simply unacceptable to envision an Orthodox Church in Greece that owed ultimate loyalty to the patriarch. The liberals' intent was to extend the authority of the king to Constantinople, not to come under the authority of the patriarch. Conservatives, who very much wanted to preserve the authority of the ecumenical patriarch and, more generally, the primacy of religion in the organization of society, argued that the establishment of an independent Church would fracture the formerly unified greater Greek nation. Thus, it would be an impediment to the realization of the Great Idea. Debates about economic policy often referred back to the Great Idea as well. Backers of the "model kingdom" argued that Greece should do its utmost to develop its existing resources, and in this way it would stand as an example of progress to the unredeemed Greeks. Others argued that the Greek kingdom was too small and too poor ever to become economically viable; the only hope for Greece was territorial expansion. The annexation of Thessaly in 1881 was viewed as a critical acquisition precisely because of its rich agricultural lands.

During the 19th century Greece gained the Ionian islands (1863) and Thessaly (1881) through diplomacy. But on balance its progress was felt to be unsatisfactory and the last quarter of the century was particularly discouraging. To the north an entirely new contender, Bulgaria, began to lay claim to lands just beyond Greece's northern border that the Greeks considered to be rightfully theirs. Mindful of the new Slavic threat, the shape of the Great Idea shifted yet again, this time towards some sort of Greek–Ottoman power sharing within the empire that still remained. Such an arrangement, it was felt, was the best way to protect Greek interests, both within the kingdom and in the Ottoman empire. Such a proposal, however, never got very far, in part because the Ottomans were not interested in sharing power with their former subjects.

It was only in the wake of World War I, with the Ottomans on the losing side and the Greeks just barely on the side of the victors (Greece abandoned its neutrality and entered the war on the side of the Allies five months before the war was over), that Greece finally had the opportunity to make the Great Idea a reality. During the course of the war the two principal Allied powers – Britain and France – had sought to win over to their side various countries by making promises of territorial enlargement once the war was over. Thus Italy, for example, was promised much of Dalmatia and the port of Vlorë in Albania, while Romania stood to gain Transylvania. Greece, for its part, was rewarded with the promise that it could occupy Smyrna and its hinterland on the west coast of Asia Minor, taking these lands, essentially, from the defeated Ottoman empire. The Greek communities in western Asia Minor, and in Smyrna in particular, were the wealthiest and the most illustrious in all the Greek world. Throughout the 19th century the Greeks had debated whether it would be best to try and extend their borders within the context of a general European war, or whether they should strike out on their own and hope that Europe would be forced to intervene. Now, with the prize of Smyrna being dangled in front of their eyes, it seemed that Greece had waited patiently until the day when European diplomacy would award it the territory it coveted. In May 1919 the Greek government began to land troops in Smyrna.

Given the long-standing disagreements over the policy implications of the Great Idea, it is perhaps not surprising that the actual pursuit of greater Greece provoked a profound political crisis. The country was already highly polarized as a result of the difficulties of incorporating the new territories gained during the course of the Balkan Wars (1912–13)and then of disagreement over Greek participation in World War I. When it looked as if the occupation of Asia Minor might actually require military campaigns, a significant portion of the war-weary Greek population began to sour on the entire operation. To the irredentist dream of the "Greece of Two Continents and Five Seas" the opponents of the war held up the concept of a "small hut honourable Greece". In the fateful elections of November 1920 the Greek prime minister, Eleutherios Venizelos, the man who had succeeded in extracting the promise of Smyrna from the Allies, suffered a massive defeat. The royalists came to power. Although during the campaign they had relentlessly criticized the operations in Asia Minor, once in power they found that they could not bring themselves simply to withdraw from the lands that had been promised for Greece. Things rapidly went from bad to worse. Most unexpectedly, a new Turkish army, under the leadership of Mustafa Kemal (later Atatürk), was forming in the interior of Anatolia. In August 1921 he managed to stop the Greek advance and thus began the long process of Greek withdrawal that would end in Smyrna in September 1922. The Allies, watching the spirited Turkish resistance to the terms of the treaty of Sèvres, slowly retreated from their promises to Greece.

The dream of the Great Idea died in the flames that consumed Smyrna in September 1922. The long history of

Hellenism in Asia Minor came to an end. The remains of the Greek army, along with a stream of refugees, straggled back to Greece. The defeat engendered another round of political violence in Greece, as those who had supported Venizelos blamed the royalists for the disaster in Asia Minor. King Constantine was forced to abdicate and a newly formed Revolutionary Committee quickly returned indictments against eight ministers and military advisers. On 28 November 1922 six of the eight were executed by firing squad.

Great Palace

The emperors' palace in Constantinople

The Great Palace of the Byzantine emperors was established in the early 4th century AD by the emperor Constantine I in the southeast part of the city of Constantinople. The palace was the centre of Byzantine court life and government, and remained in use until the sack of the city in 1204.

The Great Palace was a complex of structures rather than a single building, and its partly sloping location required the southern and eastern areas of the palace to take the form of a series of artificial terraces above the sea walls. These structures included residential and administrative buildings, reception halls and throne rooms, and numerous churches and chapels. They were very elaborately decorated and furnished and set amid landscaped gardens, containing sculpture and fountains.

The palace was continually modified between the 4th and 12th centuries, although important elements of Constantine's original plan remained. By the time the Turks entered the city in 1453, however, it was already a ruinous shell, although a few of its churches survived. Today very little remains above ground and this naturally makes reconstruction extremely difficult, especially as very few archaeological excavations have been undertaken on the site. By far the most important of these, carried out by British archaeologists in the mid-20th century, revealed the remains of a Roman-style courtyard, with an attached apsidal reception hall decorated with elaborate floor mosaics. There has been little recent excavation at the site and without more direct material evidence one still gains the most clear-cut impression of the character of the complex from written sources.

Constantine I's palace seems to have been relatively modest compared to the structures that were eventually to comprise the Great Palace complex. It was bordered on the north side by the Augusteum, the imperial square, and on the west by the Hippodrome. Each of these was provided with a monumental entrance to the imperial area, a part of the complex that was later known as the Daphne. The entrance to the palace on the Augusteum (the Chalke) was a bronze-doored rectangular structure, decorated with mosaics.

Although modifications were made in the 5th century – such as the addition of the church of St Stephen, close to the Kathisma (the imperial box at the Hippodrome) – the next major phase of remodelling was undertaken by Justinian I in the 6th century. The Chalke was rebuilt, following the Nike riots that had damaged both this entrance and the area reserved for the palace guards immediately inside it. Justinian also ensured that the palace was made more defensible – bakeries, a cistern, and granaries were built to make the court more self-sufficient in the event of another insurrection. By this time the complex had four main areas. The Boukoleon (or Hormisdas palace) was a waterfront complex above a private imperial harbour, decorated with sculptures of animals and close to a lighthouse on the line of the walls. Part of its façade – the most complete remaining fragment of the palace – still survives, at the point where it fronted the sea walls. Along with this and the Daphne, already mentioned, the third complex was the Magnaura. Its exact extent and character are uncertain, but it was to the northeast of this complex near the Augusteum. Justinian linked these buildings with long porticoes, combining what had perhaps been separate imperial focuses into a single larger complex.

After Justinian I further modifications occurred. Tiberios I redesigned the north side of the complex, demolishing buildings and erecting new structures including baths and a stable. Justin II built what was to be the most important imperial throne room, the apsed rectangular building known as the Chrysotriklinos (Golden Hall). Later still, Justinian II built the Justinianos – another major structure – and strengthened the circuit wall of the palace. Thus, the complex continued to be rebuilt and changed during the later 6th and 7th centuries, with important construction projects taking place.

It was under the direction of the emperors Theophilos (829–42) and Basil I (867–86) in the 9th century, however, that perhaps the most ambitious programmes of remodelling were undertaken. This partly involved new work on old buildings but also included the dramatic expansion and elaboration of the whole palace. Written descriptions survive of both projects. Theophilos commissioned a series of colonnaded marble halls on terraces. These included a triconch reception room (aptly called the Triconchos), with a C-shaped courtyard (the Siama) decorated with fountains, other freestanding elaborate buildings such as the Mousikos, and the Margarites, his private quarters. The last comprised a colonnaded marble living room, with a domed summer bedroom roofed with a gold-speckled ceiling supported by dark marble columns. Theophilos also built a winter bedroom nearby, on a terrace on the eastern side of the palace, overlooking the court polo pitch (the Tzykanisterion). It was on the site of this polo pitch that the most important of the structures built under Basil was located. This was the Nea Ekklesia, a five-domed church, set amid

porticoed courtyards and gardens. The southeastern part of the palace already had other important buildings, notably the church of St Mary of the Lighthouse, close to the sea walls, and the Porphyra, a porphyry-clad square structure overlooking the Boukoleon harbour.

Yet more changes took place in the 10th century, especially during the reign of Constantine VII Porphyrogennetos (913–59). Nikephoros II Phokas built a defensive wall around the Boukoleon area. Even in the 12th century the emperor Manuel I commissioned colonnaded halls for the Great Palace, decorated with mosaics. So, the complex was continually being modified and redesigned, and there is also evidence that the function of existing structures often changed. The dynamic character of the Great Palace must, therefore, be borne in mind. Nor was it the only imperial palace in the city. However, for centuries the Great Palace played a central role in both urban and imperial life.

Summary

Founded by Constantine I in the early 4th century AD, the Great Palace of the emperors was the centre of Byzantine court life and government. Located in the southeast part of the city, it remained in use until 1204. Originally built on a modest scale, it was much modified over the centuries and became an elaborate complex of residential and administrative buildings, reception roms, throne rooms, and churches.

Gregoras, Nikephoros

Historian and scholar of the 14th century

A Byzantine historian, encyclopedic scholar, theologian, and imperial adviser, Nikephoros Gregoras was one of the great intellectuals of late Byzantium. He was born and brought up in Heracleia Pontike in Asia Minor. His uncle and first tutor, bishop John of Heracleia Pontike, sent the young Gregoras to Constantinople to study theology, philosophy, and grammar with the patriarch, John XIII Glykys (1315–19). Subsequently, Gregoras befriended the great scholar and statesman Theodore Metochites, from whom he learned astronomy. Metochites introduced him to the imperial court and Gregoras became an influential adviser to Andronikos II (1282–1328). The emperor entrusted Gregoras with an important mission to Serbia in 1326 during the civil war between the two Andronikoi (1321–28) and was persuaded by him of the need for a calendar reform that Gregoras had defended in a public plea. In spite of Gregoras's superb knowledge of astronomy, the conservative Church opinion of the day prevented the change to the Julian calendar, a century and half before pope Gregory XIII's reforms in 1574.

Although Gregoras was in the camp of the supporters of the elder Andronikos during the civil war, he continued to serve Andronikos III (1328–41) afterwards. In 1331 he defeated in a public dispute the Calabrian monk Barlaam, whose Aristotelian and rationalistic views seem not to have found favour with the Byzantines. After Theodore Metochites' death, Nikephoros Gregoras inherited his enormous library and began to teach in the Chora monastery, which Metochites had splendidly renovated. Andronikos III selected Gregoras to participate in a public debate with two papal legates in 1333, but he declined, convinced that theological debates could not lead to the union of the Latin and the Greek Churches, which he favoured for reasons of political expediency.

Gregoras's involvement in the hesychast controversy in the 1340s and 1350s occupied the later years of his life and proved to be his nemesis. After the synod of 1341 confirmed the orthodoxy of hesychasm, he began to oppose vehemently the teachings of Gregory Palamas and his followers. He tried to persuade John VI Kantakouzenos, his erstwhile friend and victor in the second civil war (1341–47), of the heretical nature of Palamism, but Kantakouzenos remained until his death a steadfast supporter of hesychasm. The Church synod of 1351 reconfirmed the orthodoxy of hesychasm and condemned Gregoras. Furthermore, he was sentenced to house arrest in the Chora monastery for three years (1351–54), where he devoted his time to composing theological treatises and anti-hesychast pamphlets. A substantial part of his history consists of a polemic against hesychasm as well. Gregoras was, however, doomed to be on the losing side of the dispute. In the 15th century the Church of Thessalonica included the name of

Nikephoros Gregoras in the anathemas annually pronounced on the day of the Feast of Orthodoxy.

In spite of his bad posthumous reputation in the Orthodox Church, Nikephoros Gregoras stands out, together with Theodore Metochites and Nikephoros Choumnos, as one of the leading intellectual figures in the culturally productive period of the 14th century, sometimes called the Palaiologan renaissance. Gregoras, like Metochites, was an admirer of Plato rather than Aristotle. His dialogue *Phlorentios, or On Wisdom* is a successful imitation of a Platonic dialogue and presents the dispute between him and Barlaam. The dialogue is an important source for the arguments held by Byzantine proponents of Plato against those of Aristotle. Gregoras also wrote treatises on the construction of the astrolabe and on solar eclipses, on mathematics, on grammar, and on musicology. He was the author of imperial panegyrics and funeral orations dedicated to Andronikos II and Andronikos III. A great deal of his correspondence has survived. His theological works include saints' lives, and he wrote the *vita* of his uncle, John of Heracleia. His polemical treatises (*Antirrhetika*) against hesychasm provide important information on the ecclesiastical disputes of the time.

Gregoras's *Roman History*, covering the period from 1204 until 1358, is a valuable source for Byzantine society in the first half of the 14th century though the historical account is quite unbalanced. Although the narrative begins with the fall of Constantinople to the Latins, the emphasis is mainly on events of Gregoras's own time, with particular attention paid to theological controversy. The last third of the *History* is a polemic against Palamism. Written in a heavily archaizing style in accordance with the cultural currents of the period, the work abounds in quotations from Herodotus and Thucydides and allusions to Classical mythology. Still, the *History* shows that Gregoras was aware of the main political problems of his own day. He recognized that the loss of Asia Minor to the Turks had put the empire in an extremely critical situation. He placed the blame for the empire's straits on the civil wars and on internal divisions, while recognizing the necessity of an alliance between Byzantium and its Balkan neighbours and the need for a union of the Greek and Latin Churches. For the early period Gregoras used primarily, but not exclusively, the histories of George Akropolites and George Pachymeres. The main historical value of the work lies in the account of the two civil wars, which complements the biased autobiographical history of the emperor John VI Kantakouzenos.

DIMITER G. ANGELOV

Biography

Born at Heracleia Pontike between 1290 and 1294, Gregoras was orphaned as a child and raised by his uncle, Bishop John of Heracleia Pontike. He later moved to Constantinople to study theology, philosophy, and grammar with the Patriarch John XIII Glykys and astronomy with Theodore Metochites. A prolific writer, his works include theological treatises against Gregory Palamas and the *Roman History* in 37 books covering the period 1204–1358. He died in disgrace in Constantinople between 1358 and 1361.

Gregory V 1745–1821

Patriarch of Constantinople

Gregory V is one of the best-known patriarchs of Constantinople from the Ottoman period (Tourkokratia). This is largely due to his execution by the Ottomans following the outbreak of the Greek War of Independence. Gregory was born in 1745 in Dimitsana (Peloponnese) and studied there, in Athens, in Smyrna, and in Patmos. Invited to Smyrna by Bishop Prokopios, Gregory worked there until 1785 when he succeeded Prokopios as Bishop of Smyrna. Through his manifold activities Gregory made a name for himself and was elected to the patriarchate of Constantinople, where he served three terms in total.

His first term (19 April 1797–18 December 1798) was marked by radical developments in the intellectual and political domain. Enlightenment ideas were infiltrating society on a large scale. In the wake of the French Revolution plans for a Greek revolution were at their peak. French activities in the Ionian islands and Napoleon's presence in Egypt triggered hopes among the subjugated Orthodox of eventual liberation. Gregory took several steps to inhibit the spread of these secular ideas. He established a patriarchal printing press with censors, imprimatur, and systematic control intended to protect the Orthodox flock from Western ideas. In 1798 he issued encyclicals condemning Rigas's revolutionary pamphlets and the godless and seditious influence of the French. In the same year a booklet entitled *Paternal Teaching* under the name of patriarch Anthimos of Jerusalem was published in an attempt to provide religious legitimacy for the God-ordained Ottoman empire. Gregory, among others, was suspected of having composed it. Several other anti-Enlightenment texts were published at that time including the *Christian Reply* in 1798. Despite these counter-revolutionary actions, Gregory was dethroned and spent seven years on Mount Athos.

He was re-elected patriarch for a second term (23 September 1806–10 September 1808) and once more faced serious developments, such as the Ottoman war against Russia and England. Gregory showed his loyalty by supporting with 1000 Greek workers the construction of fortifications in Constantinople against the approaching English fleet. In addition, Gregory followed his earlier defensive policy against the Enlightenment and Western liberalism. He took measures (encyclical of March 1807) to control the circulation of books. However, the Janissary revolt against Sultan Selim III and the subequent counter-revolution again brought about Gregory's dethronment. He moved back to Mount Athos, where he stayed for nine years.

His third term as Patriarch (14 December 1818–10 April 1821) coincided with the eve of the Greek War of Independence. It was a critical period when revolutionary plans and anticlericalist currents were at their height. Gregory was aware of the *Philiki Hetaireia* (Friendly Society), but followed a very careful policy vis-à-vis the Ottoman rulers and the Greek seditionists. He organized Orthodox countermeasures against Western ideas, again including the printing press under Ilarion Sinaitis, a churchman who drew harsh criticism for his inquisitorial acts, such as compiling an index of prohibited books, and burning of books. In March 1819 Gregory issued a much-discussed encyclical concerning Orthodox education, which was critical of the teaching of science and mathematics, of new theories about the Greek language, and of the naming of Orthodox children after ancient Greeks. Probably having in mind the "Philological Gymnasium" of Smyrna, Gregory feared that such worldly interests would lead to indifference to or rejection of Orthodoxy and emphasized the value of traditional religious and grammatical lessons. In 1820, through the intervention of Ilarion Sinaitis, a radical text of the Greek Enlightenment, *Kriton's Reflections*, was publicly burnt in the grounds of the Patriarchate. This period was also marked by serious social conflicts within the Greek community in Smyrna due to the rise of a merchant class which intended to undertake a leading role in social matters, such as education, and to marginalize the Church. But in the summer of 1819 the progressive Philological Gymnasium of Smyrna was closed following organized attacks by the guilds and Bishop Anthimos, supported by patriarch Gregory. Similar problems occurred in 1820 in the schools of Kydonies and Chios. Finally, a patriarchal synod, directed against the followers of Adamantios Korais, condemned "philosophical and scientific studies" on 27 March 1821.

The most radical event of the day was undoubtedly the outbreak of the Greek War of Independence. In March 1821 the patriarchal synod issued an official excommunication of Alexandros Ypsilantis's uprising in the Danubian principalities. During that turbulent period, retaliatory measures against the Greeks in Constantinople were quite usual. When news came of the subsequent Greek uprising in the Peloponnese, Gregory was arrested and imprisoned. He was finally hanged on 10 April 1821 from the lintel of the Patriarchate's main gate at Phanar. His dead body was left for three days to public ridicule, dragged through the streets by the mob, and thrown into the sea in the Golden Horn. From there it was recovered by M. Sklavos, who brought it to Odessa. It was then buried with honours by the Greek community there. In April 1871 Gregory's relics were brought to Greece and were placed in a sarcophagus in the cathedral of Athens, while his statue was erected in front of the University of Athens. He was canonized in 1921 and is officially honoured as a national martyr. His symbolic significance for the Greek people remains great. The Patriarchate's main gate has remained closed ever since in memory of his execution.

Gregory has been a controversial figure in modern Greek historiography, for the assessments of his activities vary immensely. Some hail him as an important ecclesiastical personality and as a martyr for the Greek cause. His negative attitude towards the Greek insurrection is considered a clever subterfuge to mislead the Ottoman authorities, who were generally behind Gregory's actions and encyclicals. Others consider him a conservative Orthodox prelate, who wished to preserve the traditional establishment. They also characterize him as a Turkophile and as a staunch opponent of the Greek cause. Gregory was criticized not only by later generations but even by his contemporaries, including Korais.

Gregory undoubtedly opposed all radical changes within Greek society. His oscillation between loyalty to the Sublime Porte and to his Orthodox flock was extremely difficult and risky, and it cost him his life. It is true that he had received orders from the Ottoman authorities to resist the spread of revolutionary ideas in the East. But Gregory had other reasons to oppose the new ideas: for their danger to Orthodoxy and to the Byzantine supranational heritage of the Patriarchate. For Gregory, the time-honoured patristic and ascetic Orthodox tradition took priority in his scale of interests over the pernicious new ideas that could destroy the established order. His behaviour reflects the fact that he was a truly ecclesiastical man devoted to his religious duties. Hence, it is no wonder that his three terms in the patriarchate are noted for numerous anti-Enlightenment policies, which were unsuccessful in the long run. In fact, Gregory captured the underlying spirit of that critical period and foresaw with prophetic intuition the future impact of the Enlightenment upon Church and society. Needless to say, his predictions and fears were realized in many respects in the independent Greek state.

VASILIOS MAKRIDES

See also Korais

Biography

Born in 1745 at Dimitsana in the Peloponnese, Gregory studied in Athens, Smyrna, and Patmos. In 1785 he became bishop of Smyrna. He served three terms as patriarch of Constantinople – 1797–98, 1806–08, and 1818–21. He tried to counter the spread of revolutionary and Enlightenment ideas among the Orthodox subjects of the Ottoman empire, but his efforts were considered insufficient by the Ottomans, who hanged him on 10 April 1821. He was canonized in 1921 and is regarded as a national martyr.

Gregory of Nazianzus, St *c.*329–*c.*390

Theologian

Gregory was born in Cappadocia, one of the Cappadocian Fathers alongside Basil of Caesarea and Gregory of Nyssa. His posthumously awarded title "the Theologian" was a tribute to his writings on the nature of the Godhead (*theologia*). His father, Gregory the Elder, was bishop of Nazianzus, in south-west Cappadocia. A good deal is known about his life, because Gregory was very, perhaps only too, willing to give accounts of it. These are contained in his autobiographical poem *De Vita Sua*, of 1949 lines; in other poems and orations dealing with phases in his career, often in self-defence or self-praise; and in letters that give a lively picture of his varied preoccupations and the range of his social contacts, some of which reflect a background that, like that of his friends Basil and Gregory, is at once privileged and pious. Like Basil, he was educated to a high standard over a period of 10 years, studying in Cappadocian Caesarea, followed by a period of rhetorical training at Caesarea in Palestine and a time in Alexandria, where he encountered Platonism. Later he went on to Athens, aged about 20, to share in the student life of his friends Basil and Julian; the latter, as the emperor who defected from Christianity ("the Apostate"), was to alienate Gregory on a spectacular scale. The account he gives of this time in his life shows openness to a wide range of academic interests, his teachers including Prohaeresius who was a Christian and Himerius who was not, though tempered by a sobering piety. Gregory's first reaction to completing his formal education was to debate the future course of his life. Should he join Basil in the solitary contemplation and asceticism of a monastic life or follow one of his talents by taking up a career in rhetoric (a choice that Basil had also faced and rejected)? Initially he did neither, acceding to his father's belief that he needed his son to be ordained priest, as he was reluctantly, to help in the day-to-day life of his see of Nazianzus. Basil, having himself left, for the time being at least, the monastic life to become bishop of the important see of Caesarea, had other ideas. He, too, felt in need of assistance and persuaded his friend to be consecrated bishop of Sasima, as support in an ecclesiastical dispute. This turned out to be a severe test of friendship, since Gregory saw himself, not without justice, as being manipulated into accepting a token bishopric that amounted to nothing more than a remote collection of hovels. His disillusionment found expression in a refusal even to visit the place. Instead, he found comfort in a solitary life, before yielding to persuasion and returning to work with his father. The elder Gregory's death in 374 brought renewed pressure, this time to succeed to the bishopric. This he resisted, preferring to live again a life of seclusion, in Seleucia.

That might have remained the pattern for the rest of his life, had he not felt himself summoned to take an active part in the pro-Nicene, anti-Arian, cause of the Church. With the death of the emperor Valens in 378 the Arian party lost a powerful supporter. Gregory, seeing a chance of loosening the Arian hold on Constantinople, took on a preaching campaign in the tiny Anastasia church. His sermons were soon attracting wide attention. The five *Theological Orations* of 380 did much to hearten the Nicene community, reviving under the encouragement of the emperor Theodosius. When the Arians were expelled from the capital by the emperor and he summoned a council to settle the doctrinal issues of the Church, Gregory was perceived to have played a major role in the reversal. This was recognized by his being declared the true bishop of Constantinople, in place of Maximus whose actions over several years in pursuit of power were seen, at best, as equivocal. Not only that, but on the death of Meletius, bishop of Antioch, in 381, Gregory was appointed president of the Council of Constantinople, which was to save for the Church the Creed of Nicaea of 325 and to give to all subsequent generations the form that became known as the "Nicene Creed", a centre point of the Eucharist. The acrimonious nature of the debate that preceded the settlement did not agree with Gregory's temperament and he resigned. Returning to Nazianzus, he stood in as an interim bishop until a successor

could be appointed. Perhaps suffering from the bad health to which he often claimed to be subject, and possibly doubting the suitability of his successor, his cousin Eulalius, he gave the impression of retiring none too soon. From 383 he lived in contemplative and active literary retirement, on his family estates, until his death in 389 or 390.

In character Gregory may be accounted a rather strange mixture. The speaker who could deliver carefully crafted orations based on accepted rhetorical models was clearly aware of himself as a public figure. He shied away, however, from many of the administrative duties that might have gone with that role. Yet in his periods of solitary withdrawal he could never entirely rid himself of anxiety about his reputation in the active life that he claimed to have quit so gladly.

As a man of letters Gregory shows at least competence, and often distinction, in several spheres. The best of the orations have been taken as something of a high point in the harmonious synthesis of Classical and Christian cultural traditions, polished and often telling as they range over topics of central theological importance, events in the Christian calendar, personal statements, and eulogies of heroes such as Athanasius and Basil, or, less commendably, denunciations of the dead Julian. His 250 or so surviving letters, some very personal and others written with an eye to publication (a novelty), are generally models of style, well exemplifying his professed ideals of conciseness, clarity, and grace or beauty (*syntomia*, *sapheneia*, *charis*). Gregory's verse has been variously judged. There are tracts of tedious formal versification, while other poems merit careful reading. The autobiographical *De Vita Sua* contains fine passages, as do other poems written about his experience and variable emotions, while some of his "dogmatic" poems, particularly the *Arcana*, have some claim to stand in the literary tradition of didactic verse.

Showing throughout a good deal of his writing are philosophical influences, most of all Platonic. His theology draws on, among others, Irenaeus, Clement, and Origen. (He collaborated with Basil on the Origen selection in the *Philokalia*.) Of his contemporaries he shows especial veneration for Athanasius and Basil. Yet he emerges with an individual voice, as he vigorously defends the Nicene position, notably against the form of later Arianism that was championed by Eunomius. He was regarded as a foremost opponent of the views of Apollinarius, his opinions being cited at the Councils of Ephesus (431) and Chalcedon (451). Gregory held that, by denying the presence in Christ of a human mind, Apollinarius had deprived him of real humanity and thereby human beings of salvation. In his Trinitarian theology, while following the revered Basil, he achieves insights and modes of expression and emphases that are his own. He stresses the divinity of the Holy Spirit as a natural perception in a developing understanding of the Christian faith, speaking of "procession" from the Father. In Gregory are to be found clear enunciations of belief in the unity, equality, and distinct relationships of the three persons, each preserving individual characteristics.

In what was often the troubled seclusion of his last years, Gregory may well have wondered what his life had achieved. Successors were to prove more positive. Councils accepted his theology and posterity awarded him his title. For John of Damascus in the 7th/8th centuries Gregory is the most favoured of the earlier Fathers for the soundness of his thinking and the clarity of its expression. Translations into Latin by Rufinus brought orations of Gregory's to the West. As an orator, he was widely studied throughout the Byzantine period as a model for the successful union of Christian thought with the high, Attic style of eloquence, doing much to establish the official language of the Greek Church. It is fitting that his pictorial representations should enliven a number of manuscripts.

Biography

Born in Cappadocia *c.*329, Gregory was a close friend of Basil of Caesarea. They studied together in Caesarea in Palestine, and in Athens. Later they both became monks and (less willingly) bishops, Gregory of his native Nazianzus and later of Constantinople. He preached in strong support of Nicene orthodoxy and wrote widely in prose and poetry on (mostly) theological topics. He died in Cappadocia *c.*390 and was awarded the title "the Theologian" by the Council of Chalcedon in 451.

Gregory of Nyssa, St *c.*330–*c.*395

Theologian

Gregory was a younger brother of Basil of Caesarea and one of the Cappadocian Fathers. We know much less about his life than about that of Basil or their friend Gregory of Nazianzus: probably there is less to know. His writings show the depth of his education, yet there is no account of it to match the detailed curricula of their studies. He himself attributes his education to Basil's tuition, but it is likely that he supplemented this with a great deal of private study. The relatively quiet life that he led would have conduced to his emergence as one of the most scholarly men of his generation. Of the rest of Gregory's personal life only hints survive. A reference to his marriage is cryptic. Conjecture has suggested that his wife may have died or become a nun by the time he took up the monastic life. This meant that he, like Basil and Nazianzus, abandoned the possibility of a career in rhetoric. Unlike his brother, however, he found that elevation to the episcopate brought neither prestige nor personal fulfilment. The see of Nyssa was remote, deriving its little importance from being a subsidiary station in Basil's ecclesiastical territory. When Gregory went there in 372 he would have found little intellectual stimulus, though its minimal demands might have suited a man with small desire to be a bishop, and his removal three years later, on the grounds of staunch anti-Arian views in a period of Arian influence, would have caused as little heartache as his return, following the death in 378 of the Arian-minded Valens, would have produced jubilation. He had a gift for thinking and writing and was glad of any opportunity to exercise it. When, however, events demanded, he did not stand aside from activity. Though his appointment as bishop of Sebaste was no more successful than that of Nyssa, and of very short duration (he was glad to hand over to his brother, Peter), the intensity of his ardour for the Nicene position drove him, no less than Basil and Nazianzus, to powerful writing in its defence. He took part in the Council of Constantinople in 381, having previously written pointedly against the extreme Arianism of Eunomius. Indeed, he appears to have found after the council a new standing within the Church, recognized by the now Orthodox imperial family. He was appointed by the emperor Theodosius to a position of doctrinal supervision and in 385 was invited to deliver funeral orations on the empress and her young daughter. The final decade of his life saw much activity as a preacher and as a creative theological writer.

For Gregory, seclusion, whether of the study or in remote territory, was the condition of his most vigorous and effective activity. Of the three Cappadocians, he was the prime intellectual, wide-ranging in his search for understanding and deeply probing with the instruments of honest inquiry. At home in the traditions of Classical literature, though sometimes in its more contrived forms in his writing, in his fundamental thinking he is able to draw on Platonic lines, particularly in the version mediated by Origen. In his expositions of scripture, he employs aspects of Origen's methods of eliciting mystical senses. Works in which this is most evident include the *Life of Moses*, homilies on Ecclesiastes, the Song of Songs, the Lord's Prayer, and the Beatitudes. Writings of this kind have an affinity with treatises directed towards the ascetic life. *On Virginity* also provides a link with some of the practical issues with which Basil was concerned. While his brother evolved rules for the monastic life, Gregory probed in a different way the principles of the vocation, looking for the theory behind the practice, finding in virginity an essential way into the life of holiness, evoking Platonic notions and Origen's concept of the human soul as the Bride of Christ. Gregory's ability to bring together Classical and Christian backgrounds is seen in the dialogue *On the Soul and Resurrection*, set at the deathbed of his sister Macrina and showing the influence of Plato's *Phaedo*. She is also the subject of a fine Life written by Gregory, very much aware of his family in his admiration for his sister, who is represented as a considerable intellectual force in her own right, no less than in deference towards the dominating Basil. This is widely shown in his work, as in *De Hominis Opificio* (On the Making of Man), seen as a respectful supplement to his brother's writing. Clear theological positions are to be discerned in his dogmatic writings. He is unyielding in his defence of the Nicene position, over against Eunomius, taking his place alongside the other Cappadocians in maintaining the divinity of the Holy Spirit and in developing a doctrine of the Trinity, in works that include *That There are Not Three Gods*. He joins Nazianzus in opposition to what he saw as Apollinarius' failure to give a due place to the human nature in Christ. Gregory's celebrated *Catechetical Oration*, written around 385, is a masterly attempt to set out in summary form, with room for discussion, major tenets of Christianity, and has been seen as a small-scale successor to Origen's *On First Principles*. The approach is to people at an impressive level of philosophical awareness who are willing to explore the relationship of biblical revelation to Platonic thought. It is in this context that Gregory deals with the Incarnation, salvation, and ultimate destiny, following Origen in his envisaging a final restoration of all to life in God. The work also fulfils the function of instructing catechumens in the understanding of the sacraments of baptism and the Eucharist.

Like his fellow Cappadocians, Gregory was notable as a correspondent, though his letters survive in smaller numbers. These testify to his social contacts as well as to his doctrinal interests and questions of Church practice.

Not awarded honorific titles such as "the Great" or "the Theologian", as were Basil and Nazianzus, Gregory has some claim to be thought the most original and most profound of the Cappadocians. Later generations have found in his reflective mind insights that have outlived the controversies of his time.

Biography

Born *c.*330 in Cappadocia, Gregory was the younger brother of St Basil and the youngest of the "Cappadocian Fathers". Little is known of his life, but he seems to have married early before becoming a monk. Ordained bishop of Nyssa *c.*371 by his brother Basil, and later bishop of Sebaste, he took part in the Council of Constantinople in 381. After the death of Basil in 379 he wrote widely on theological topics and is regarded as the most intellectual of the Cappadocians. He died *c.*395.

Gregory Palamas, St 1296–1359

Theologian

St Gregory Palamas exercised an enormous influence not only on the development of Byzantine theology but also on the relation between that theology and the Hellenic tradition. Byzantium in the 14th century remained gripped by the debate between sacred and profane learning, between the patristic tradition and incipient humanism. Palamas played a pivotal role in determining the Church's attitude to the wisdom of the Greeks.

Against a series of detractors – the Calabrian monk Barlaam, Gregory Akindynos and Nikephoros Gregoras – Palamas developed a theology that was both creative and traditional. His initial debates with Barlaam were concerned with theological method. Palamas perceived Barlaam's anti-Latin arguments to be potentially dangerous in their apparent relativism. Barlaam claimed that the syllogisms of the Latins were not apodictic, or demonstrative, according to the definition of Aristotle. Citing Dionysius the Areopagite, he argued that no apodictic reasoning was possible vis-à-vis the divine. Palamas felt that this kind of argument equally undermined the Greek as the Latin position on the procession of the Holy Spirit. Furthermore, was God not revealed? Did he not unite himself with the saints? Palamas's *Apodictic Treatises* represent his first counter to Barlaam's theological agnosticism.

With the emergence of Barlaam's criticisms of the psychophysical methods of prayer used by the hesychast monks, the controversy began to heat up. Palamas began with a powerful demonstration of the integrity and wholeness of the human person, and the consequent appropriateness of the body's participation in the spiritual life. Palamas had a weighty patristic and biblical tradition behind him on this point, and was soon able to dispense with this aspect of Barlaam's critique. Barlaam had also defined the light of the Transfiguration, which the hesychast monks claimed to experience in the highest states of prayer, as a created light. Palamas argued, citing several patristic witnesses, that this light was in fact uncreated and divine. It was, in some sense, God. This raised the problem of how man can be said to participate directly in God, while maintaining divine transcendence.

Palamas's solution was essentially to posit a real distinction between the imparticipable and transcendent divine essence and the participable and immanent divine operations or energies. God is one according to essence, three according to hypostasis, and manifold according to energy. It is according to energy that man is united to God. This doctrine was strenuously opposed by Akindynos, and by many since his time. It was, however, received by the Church at the councils of 1347 and 1351, a vindication confirmed by the canonization of Gregory Palamas in 1368, only nine years after his death. His feast falls on the second Sunday of Lent, an exceptional honour that makes of it a second "Triumph of Orthodoxy".

Palamas's oeuvre is extensive. Most of it has now been published. Among his purely spiritual works, his *Life of St Peter the Athonite* should be mentioned. He also produced works on prayer and the monastic life. The bulk of his work is concerned, directly or indirectly, with the hesychast controversy. His most important works are the *Triads in Defence of*

St Gregory Palamas: fresco of the saint in the Chapel of the Hagioi Anargyroi at the monastery of Vatopedi, Mount Athos, *c.*1371

the Holy Hesychasts. Particularly worth looking at are the *Natural, Theological, Moral and Practical Chapters*, found in the *Philokalia*. There is also a substantial collection of homilies, delivered as archbishop of Thessalonica.

Palamas's sources are predominantly biblical and patristic. He cites the Cappadocian Fathers, St Athanasius the Great, St Cyril of Alexandria, and, especially, St Maximos the Confessor to support his case. He makes great use of Dionysius the Areopagite, albeit reading Dionysius very much in the tradition of Maximos. Among spiritual writers, he draws on the traditions of both Evagrius of Pontus and (pseudo-) Macarius, very much as Maximos had done.

More immediately, Palamas was an heir to the very constructive theology of Gregory of Cyprus, patriarch from 1283 to 1289. He was also much indebted to the teachings of Theoliptos of Philadelphia and Nikephoros the Hesychast and exhibited great admiration for patriarch Athanasios I of Constantinople (1289–93 and 1303–09).

One of the most interesting aspects of his thought is his attitude to the Hellenic tradition. Palamas received an excellent education, thanks to his family's connections with the ruling house. He studied under, and apparently greatly impressed, Theodore Metochites, the Great Logothete. He appears to have followed the trivium and quadrivium, which included the study of Aristotle but not of Plato. He gave up his studies and embraced the monastic life at the age of about 20. Palamas never entirely repudiated profane learning, so long as it was restricted to its proper sphere. Barlaam's Aristotelianism appeared to Palamas to be using philosophy to undermine theology, and to deny the very possibility of human knowledge of the divine. Palamas replied by allowing that man has a natural capacity to investigate the things of the world, and even that this capacity is a gift of God, but that such natural knowledge is inferior to the supernatural knowledge granted by God to man through grace. Philosophy never has absolute value in Palamite theology.

Palamas has often been accused of obscurantism, notably by the Byzantine humanist Nikephoros Gregoras. This is unfair, because Palamas did not seek to reject the Hellenic tradition outright, only to stress its inferiority in relation to divine revelation. Adherence to Palamite theology did not inhibit the flourishing of a Christian humanism in Nicholas Kabasilas. Furthermore, Palamism did not determine attitudes to union with the West. Mark of Ephesus, the leader of the anti-unionists at the Council of Florence in 1438–39, was a committed Palamite, whereas his successor as leader of the anti-unionist party, George (later Gennadios) Scholarios, was essentially a Thomist. The victory of Palamite theology is not, therefore, to be regarded as a rejection of the Hellenic tradition, but as the subordination of that tradition to the truths of revealed theology.

MARCUS PLESTED

Biography

Born in Constantinople in 1296, Gregory received a good education as a pupil of Theodore Metochites but gave up his studies in 1316 to become a monk on Mount Athos. Most of his literary output was concerned with the hesychast controversy in which he was famously embroiled against Barlaam of Calabria. But he made a positive contribution to creative theology and was canonized in 1368. He died in Thessalonica in 1359.

Guilds

Compulsory or free associations of craftsmen or merchants are attested in large cities throughout the late Roman and Byzantine period (4th–15th centuries). Over these centuries, their organization, the extent of government control over their activity, as well as the conditions of admission and functioning, underwent considerable change. Special legislation was drafted for the guilds of Constantinople in the 10th century – *The Book of the Eparch* – which aimed at protecting the guild members from competition by craftsmen outside the guild and at securing better protection from the state.

After the fall of Constantinople to the Ottomans in 1453, there is no evidence of state involvement in the compulsory organization of Christian craftsmen into guilds. Nevertheless, the conditions of foreign conquest created the need for increased solidarity among the conquered peoples, which materialized into various forms of associations under Ottoman rule. The prevailing insecurity in the various manifestations of social life, as well as economic protectionism in the financial policy of the Ottoman empire, led to the creation or reorganization of two predominant forms of association: the community (of a political character) and the guilds (of an economic one). The associations of craftsmen were called *esnaphia* or *rouphetia*; those of the merchants were called "companies", *syntrophies*, or later, *systemata*, while those of the sheep and goat herd-owners *tselingata*, and of the shipowners *syntrophonaphtes*.

Besides the associations of individuals in guilds, there also existed associations of local communities of a given geographical area that jointly produced, processed, and, eventually, traded various products. These associations assumed the form of guilds or, in some cases, that of cooperatives. Examples were the Mademochoria in Chalcidice in Macedonia for cast iron, the Mastichochoria in Chios for the production, collection, and processing of mastic, Ambelakia in Thessaly for spinners and dyers of red yarn, and the village communities around the silver mines in the southern coast of the Black Sea (Pontus). Those associations that were important to the Ottoman economy were granted privileges by the sultans and, in some cases, the monopoly of production, processing, or trade of the product. The development and prosperity of the guilds were encouraged by the Ottoman system of taxation. The guild was a fiscal unit that paid as tax a lump sum, which was proportionately divided among its members; the tax could also be assessed in kind, in which case its members provided the share attributed to each one of them by the guild board. As guilds developed and prospered, they reached a higher level of organization and acquired administrative, police, even judicial jurisdiction.

Probably from the end of the 16th century – and certainly from the early 17th – guilds played a significant part in the organization and life of the Christian community. Representatives of the guilds participated, as a rule, in the administrative council of the Christian communities and their charities (hospitals, schools, etc.). The generous support given by the guilds to the Church and monasteries is also widely witnessed in documents. The importance of guilds in the system of self-government of the Christian communities lasted until the period of the Tanzimat, when the community administration had to comply with the General (or National) Regulations of 1860–62.

The administration of the guilds was based on the internal hierarchy of its members: apprentice, head apprentice, craftsman, head craftsman, master craftsman (*mathitoudi*, *tsiraki*, *paragios*, *kalphas*, *protokalphas*, *mastoras*, *protomastoras*). Promotion from lower to higher rank was open, but depended on craftsmanship which was examined and decided upon by the guild's elected board. Guilds functioned and were governed on the basis of unwritten by-laws well into the late 17th century. From the 18th century onwards, written statutes were often drafted and voted by the members' assemblies; they had to be confirmed by the local Orthodox bishop, usually with no further involvement of the Ottoman authorities. In some towns the guilds had common statutes. The large merchant guilds – "companies" – were a type of association observed among the Greeks outside the Ottoman empire, mostly in the Austrian empire where they traded in oriental goods and formed prosperous communities. Some of these are known to have been granted privileges by the Austrian emperors (in Hungary and Transylvania).

Gypsies

The first documents recording the presence of the Gypsies in Europe and the Mediterranean region date from the Byzantine period and also provide proof of their presence in Thrace. The Gypsies stayed in Thrace for longer than in many other regions and this had a significant influence on their language. The Life of St George the Athonite, written in Georgian by one of the saint's followers and dating from 1068, is regarded as the oldest known source. In another source dating from 1204, Theodor Balsamon reported on "satanic" people with the ability to predict the future. The Byzantine cleric called them *athinganoi* (*athinganos* in the singular) or *atsiganoi* (singular *atsiganos*), identifying them with followers of the heresy of this name, who were active in Asia Minor during the era of Emperor Michael II (820–29). The word *athinganoi* comes from the Greek verb *thingano*, to touch, and means "the untouchables". Linguists have not yet been able to ascertain whether the word *atsiganoi* is a derivative of *athinganoi*.

Whatever the case, the name *atsiganoi* (and its abbreviated form *tsiganoi*) was the source of names used for this group in several languages, as in the German *Zigeuner*, the Spanish *gitanos*, the Turkish *çingene*, and so on.

Following attacks by Turkish tribes on Thrace and Byzantium in the 14th century, the Gypsies moved from Thrace to Bohemia and then spread throughout Europe. Before this a few groups had emigrated southward to the Peloponnese, to Crete, Corfu, and the Ionian islands. References to their presence in Crete can be found in the stories of Franciscan monks Simon Simeonis and Hugo the Enlightened from 1322.

During the Ottoman empire it seems that a significant number of Gypsies continued to live in Thrace and Rumeli, as attested by official documents of the period (censuses, administrative documents, etc.). After the Graeco-Turkish War and due to the compulsory exchange of population between Greece and Turkey (ordered by the Treaty of Lausanne in 1923), Christian Gypsies joined the refugees from eastern Thrace, Istanbul, and Asia Minor and took up residence in Greece.

The Gypsies did not escape the devastation of World War II. During the German occupation of Greece many thousands of Gypsies were deported to concentration camps: the archives of Ravensbrück concentration camp provide evidence of this.

Today the Greek Gypsies generally call themselves *Tsiganoi*. The name *Gyphtoi* (*Gyphtos* in the singular) is also common, although it tends to be used by non-Gypsies and in a pejorative way. The word *Gyphtos* is an abbreviation of *aegyptios* ("Egyptian") and refers to the belief – current until the 18th century – that Gypsies came originally from Egypt. They are also called *Katsiveloi* (singular *Katsivelos* and feminine form *Katsivela*), a name that is found as early as the 14th century in Byzantine sources. According to linguistic studies the word comes from the Italian *cattivelo* (*cattivo* + *ello*), meaning "captive" and in the figurative sense "impoverished" or "destitute". Alongside these general names, other names are also used, such as *Kalo* (i.e. "the Dark One"), *Malele*, *Manouch*, and so on. Gypsies are also called by names which refer to their occupations or their geographic origin. Thus they can be called *romiogyphtoi* ("Greek Gypsies"), *turkogyphtoi* ("Turkish Gypsies"), *arnavout* ("from Albania"), or *chalkiades* ("smiths"), *demertzides* ("tanners"), *meskarides* ("bear trainers"), *tsabasides* ("cattle dealers"), *laoutarides* ("lute players"), and so on.

Artists have often been inspired by the lifestyle and philosophy of the Gypsies: for example the author Alexandros Papadiamantis with his novel *I Gyphtopoula* (The Gypsy Girl) or the poet Kostis Palamas with his important poetic work *O Dodekalogos tou Gyphtou* (The Twelve Words of the Gypsy). Very little attention has been paid to the Gypsies' contribution to Greek popular culture, although this seems to have been considerable: one needs only to think of their musical contribution to Greek popular festivals (*panigyria*). Unlike their culture, their language and their various dialects have been the subject of a number of studies by Greek and international linguists.

The Gypsies are probably the largest minority in Greece in numerical terms, although they have never been officially recognized. Their present population cannot be given exactly, as no data for minorities is available after the census of 1951. The figure is estimated at around 120,000 to 150,000, taking into account the increasing emigration towards western Europe in recent years. The problem of estimating their population is further complicated by the fact that even today many Gypsies are not registered with the appropriate authorities.

In terms of their political status, the Greek Gypsies (with the exception of the Muslim groups living in western Thrace) were still stateless until a few years ago, as they were denied the right to Greek citizenship. It was not until 1978 that special regulations were introduced by the state, and in 1979 they were finally granted the right to full citizenship.

The Gypsies in Greece should not be regarded as a homogeneous group: they vary widely in terms of religion (Christian and Muslim, although the majority are Christian), in terms of language (mostly Romany but also Turkish and Greek), in terms of their degree of integration in Greek society, and their social status. Gypsies can be found throughout the country, although they live mostly on the outskirts of cities and provincial towns or in villages; generally they live in communities clearly separate from the rest of the population, often in ghettos which are rarely visited by outsiders. Although most of them have fixed places of residence, a significant proportion lead an itinerant lifestyle for financial reasons – because they are employed seasonally (in agriculture, for example) or live by trading. A good example of their heterogeneity can be found in three areas of western Athens: Agia Varvara, Ano Liosia, and Kolonos. Christian and Muslim Gypsies live in Kolonos, although there is scarcely any contact between them. While the Gypsies in Agia Varvara are regarded as the most fully integrated, the groups that live in Ano Liosia suffer from wretched living conditions and marginalization by non-Gypsies.

In general the Gypsies are marginal communities within Greek society: they are among the social groups who are most at risk, frequently living in conditions of great poverty. Illiteracy levels are high, as many studies of their social situation have demonstrated. Child labour is widely prevalent: their children are a common sight on the streets of cities and towns selling trinkets, washing car windscreens, or begging to earn a living.

On the initiative of several municipal councils the Intercommunal Roma-Network was founded in September 1995 in order to implement a nationwide plan to solve the most urgent problems facing the Gypsies. Objectives include the elimination of discrimination and marginalization by state and social bodies, and the support of nomadic or semi-nomadic groups.

SEVASTI TRUBETA

Summary

Gypsies, known in Greek as *athinganoi*, *atsiganoi*, *Gyphtoi*, or *Katsiveloi*, originated in India. In Europe they were first recorded living in Thrace before moving to Bohemia and elsewhere in the continent. They form heterogeneous groups in terms of religion, language, degree of social integration, and social condition. They are the largest minority in Greece and yet have never been officially recognized, though since 1979 they have been able to take Greek citizenship. As social groups they are marginalized and at risk.

Gyzis, Nikolaos 1842–1901

Painter

Like his lifelong friend and fellow Tinian the painter Nikephoros Lytras, Nikolaos Gyzis belongs to the so-called "Munich school" of Greek painters. But unlike Lytras, who returned to Greece to teach and work, Gyzis is an example of a Greek expatriate whose life and career unravelled entirely abroad without forsaking its distinctive Hellenic character. This character flourished in the context of the dual artistic trends – ethnographic genre and classicizing symbolism – prevalent in German art, especially in Munich, in the second half of the 19th century.

Hellenism was indeed a driving force in 19th-century Bavarian culture. In the first decades of the century, under the enlightened patronage of the philhellenic king Ludwig I, father of Greece's first king, Otho, Munich, the capital of Bavaria, became a lively cosmopolitan city adorned with handsome neoclassical buildings and museums, including Leo von Klenze's Propylaion, a modern echo of the celebrated gateway to the Athenian Acropolis, and his Glyptothek with its important collection of ancient Greek sculptures. By the second half of the century, Munich rivalled Paris as a centre for artistic instruction and lively artistic and intellectual exchange.

It was in Munich's celebrated Academy of Fine Arts that in 1865 the young Gyzis first came to study painting under the academic history painter Karl Theodor von Piloty (1826–86). He settled there permanently thereafter, with only rare trips abroad, to Greece and Asia Minor in 1872–74, and 1877; to Paris, along with Lytras, in 1876; and to Greece again in 1895. He achieved prominence as an artist in both his homeland and in Germany. In 1880 he was elected to honorary membership of the Munich Academy, and two years later was appointed full professor there. In Greece he was decorated by King George I in 1880.

His early works, up to the late 1880s, exemplify the contemporary fashion for sentimental, realistic, and anecdotal everyday-life scenes with a strong ethnographic flavour. In that sense, he followed the direction of contemporary Munich artists of his generation, including Ludwig Lofftz, Wilhelm Leibl, and the early Max Liebermann. Gyzis drew inspiration from a dual source: life during the times of the Greek struggle for independence from Turkish rule; and modern Greek customs and festivals. Among the former, *The Betrothal* (1875, National Picture Gallery, Athens) depicts the custom, prevalent in the rural countryside, of early engagements between children of well-to-do landed families intent to secure and expand their estates through profitable family connections during the uncertain times of Turkish rule. The painting known as *Children Gathering* (National Picture Gallery, Athens) refers to the brutal Turkish practice of abducting the first male offspring of Greek families to be raised as and become part of the fierce Turkish militia, known as the Janissaries. In turn, *The Secret School* (*c.*1885, private collection, Athens) is a scene of Greek resistance to Turkish efforts at cultural and linguistic levelling in occupied Greece. It represents a makeshift class of Greek children surrounding a Greek monk who teaches them how to read their native language in the secluded safety of a church interior, at night. A fully armed chieftain guarding the entrance is seated on a broken Ionic capital, a symbolic reference to the continuity of Greek culture from ancient to modern times.

The persistence of picturesque customs and festivals into contemporary times is the theme of paintings such as *The Grandmother's Tale* (1883, National Picture Gallery, Athens) with its attentively listening children clustering around the tale-telling grandmother. *Carnival in Athens* (*c.*1885, National Picture Gallery, Athens) is a scene of boisterous revelling and good-natured funmaking whose lavish ethnographic decor situates it in the coutryside rather than in urban Athens. These paintings depicted a colourful and highly idealized rural society that would appeal to middle-class Greek urban patrons as well as to an international clientele in a time of revived ethnographic interest throughout Europe.

Sometime in the early 1890s Gyzis gradually abandoned realistic genre for classicizing allegory with symbolist overtones. This redirection of his manner owes a great deal to the turn towards a more idealistic form of art inspired from ancient Greek myths and ancient Greek sculpture among the Munich avant-garde, and in Germany more generally. In Munich, the movement culminated in the creation of the first Munich Secession founded by artists such as Franz von Stuck and Georg Hirth, and the elaboration of the new style known as *Jugendstil*. Other painters included the Swiss Arnold Bocklin, who worked in Germany, and Hans von Marees who spent some time in Munich between 1857 and 1864.

Gyzis's work in that vein is anticipated by his painting *Spring Symphony* (1886, National Picture Gallery, Athens), a fantastic allegory of natural and spiritual renewal brought about by the sister arts of music and painting. His monumental work, *The Triumph of Bavaria* (*c.*1895; destroyed), a ceiling painting for the museum of applied arts in Nuremberg known through preliminary studies only, showed Bavaria in

the guise of the goddess Cybele riding a lion-drawn chariot. Characteristic of his shift to symbolic allegory in a severe, classicizing style is also his painting commemorating the destruction of the island of Psara by the Turks as narrated in a poem of 1825 by Dionysios Solomos. Gyzis envisioned a gigantic, allegorical figure of victory or Nike mournfully surveying the burnt and ravaged island (1898–99; National Picture Gallery, Athens). From this phase, too, date numerous graphic works, posters, advertisements, and illustrated diplomas, including his design for the diploma of the 1896 Olympic Games.

Gyzis's artistic impact may be seen not so much on his immediate circle of Greek pupils trained in the Munich academy, such as the painters George Roilos (1867–1928) and Symeon Savvides (1869–1927), among others. Rather, his classicizing idealism provided the impetus for contemporary 20th-century painters, including Konstantinos Parthenis, George Moralis, and Panayotis Gounaropoulos.

Biography

Born in Tinos in 1842, Gyzis studied in Munich under the painter Karl Theodor von Pilory and settled there permanently. Recognized as an artist in both Greece and Germany, he was made an honorary member of the Munich Academy in 1880 and a full professor there in 1882. In Greece he was decorated by King George I in 1880. His classicizing idealism influenced many 20th-century painters. He died in 1901.

H

Hades

Hades, which in antiquity could denote both the subterranean kingdom of the dead and the god who ruled over it, means "that which is unseen", according to an ancient etymology. In the Classical period, however, "Hades" invariably referred to the god, never to his realm, which is described as "the house of Hades". He was the brother of Zeus, who ruled the upper air, and of Poseidon, who ruled the sea, though he never visited Mount Olympus. Rarely is mention made of any cult in his honour, due no doubt to the fact that he is characteristically described as "implacable" (*adamastos*) and "relentless" (*ameilichos*), and "most hated of all the gods". The most celebrated myth associated with his name involves his abduction of Demeter's daughter Persephone, whom he deceived into becoming his bride. In Greek mythology this is the explanation for the changing seasons, since Demeter, who succeeded in gaining her daughter's release from the clutches of Hades for eight months of every year (spring and summer), grieves and neglects the earth for the remaining four (autumn and winter).

Little is known about the appearance of the mythological kingdom of the dead. Its essential characteristic, however, was its impenetrable darkness. The earliest literary description is to be found in book 2 of Homer's *Odyssey*, where Odysseus visits the bounds of Oceanus in order to consult the denizens of the underworld. In book 24 the messenger god Hermes conducts the gibbering dead past Oceanus, the white rock, the gates of the sun god Helios, and the realm of dreams until they eventually reach the asphodel meadow.

The next literary description of Hades is provided by Aristophanes in his comic masterpiece *Frogs*. Having asked Heracles to describe to him the route by which he descended to the underworld to fetch Cerberus, the god Dionysus is informed that he will first come to a fathomless lake which he must cross in Charon's boat and then to "serpents and beasts in thousands", a "mass of mire", and "everlasting dung". Another important literary source is provided by myths put forward by Plato in his dialogues *Gorgias*, *Phaedo*, and *Republic*. The so-called Orphic gold leaves, which date to the 4th century BC, also provide limited information about the imaginary topography of the region. In addition, underworld scenes frequently appear in a series of Apulian amphorae of the later 4th century BC.

Hades' helpers only gradually assumed an identity and always remained somewhat shadowy. The earliest to emerge was Cerberus, the many-headed dog who acted as warder of the dead. Charon, the ferryman of the dead, did not appear until much later. In the Hellenistic period it became customary to place a small coin known as an obol in the mouth of the dead to pay for their fare across the River Styx. Charon is frequently depicted on Attic *lekythoi* (unguent flasks), waiting while the dead approach his boat.

It was a significant feature of Greek belief that the good and the bad led an equally cheerless existence in Hades. In early times very few were accorded a different destiny. They include the "blessed heroes", who, according to Hesiod (*Works and Days*, 166ff.), inhabit the Isles of the Blessed. Deep in the bowels of Hades was a windy region called Tartarus to which were consigned those who had outraged the majesty of the gods. Among its prisoners was Tantalus, who served his son Pelops to the gods to test whether they could distinguish human flesh from animal flesh. Around the mid-5th century BC a more developed belief in a dualistic afterlife emerged, due largely to the popularity of the mystery religions, which offered ill-defined blessedness in the hereafter for initiates. Principal among these was the Eleusinian Mysteries. Greek religion, however, did not promote anything comparable to the Christian notion of "weeping and gnashing of teeth" for those who failed to secure such blessedness.

The quality of life in Hades is well summed up by Achilles' observation to the effect that he would rather work as a day-labourer for a man who had little property than be lord of all the spirits of the dead (*Odyssey*, 11. 489–91). When encountered in the underworld, the dead appear to be frozen in a time warp. Ajax, for instance, is unable to forget the rancour that he feels towards Odysseus for having been beaten in the contest for the arms of Achilles. Equally pathetic is their preoccupation with the welfare of those who have survived them. The dead were believed to remain at the same age and in exactly the same physical condition that they were at the moment of death. Oedipus, for instance, states that the reason why he blinded himself was so that he would not have to look upon the faces of his parents in the underworld (Sophocles, *Oedipus Tyrannus*, 1371–73). Even so, it was infinitely preferable to enter Hades than to pass all eternity between two worlds. Especially to be pitied were the unburied dead. "Bury me as quickly as possible," Patroclus requests of Achilles (*Iliad*,

23. 71ff.), "so that I may enter the gates of Hades." In Sophocles' *Antigone* denial of burial is represented as an offence against the gods.

The Greek notion of Hades was taken up and developed by the Romans, notably by Virgil in *Aeneid* book 6. In the Septuagint Hades is used to translate the Hebrew word "Sheol". In Christianity the term is sometimes used of the place to which Christ descends after the Crucifixion.

Hadjidakis, Manos 1925–1994

Songwriter and composer

Successfully bridging the worlds of popular and classical music throughout his long career as a songwriter, composer, conductor, and arts administrator, Manos Hadjidakis was a central figure in the musical life of Greece after World War II. He was born in 1925 in the northern Greek town of Xanthi, to a Cretan father and a mother from Adrianople. In Xanthi he received his first musical instruction from an Armenian pianist. After moving to Athens at the age of seven, he developed catholic tastes through exposure to the wide variety of popular and classical music to be heard in the capital. Although his decision to undertake advanced musical studies was frustrated by the onset of World War II, Hadjidakis nevertheless began composing music for the theatre in 1943. Emerging from the German occupation and subsequent civil war an enthusiastic autodidact, he embarked on what he later designated as the first of six creative periods: (1) 1946–50 "Theatre, music, and poetry"; (2) 1951–56 "Eros and a bit of music"; (3) 1957–66, dominated by film scores and popular song; (4) 1967–71 "Abroad"; (5) 1972–89 "Return to Greece and a period of maturity"; and (6) 1990–94.

With the piano suite *For a Small White Seashell* (op. 1, 1947–48), Hadjidakis began to assign opus numbers to what he felt were his most significant works, ultimately setting apart 51 of his 179 major compositions in this way. He regularly transcended the stylistic boundaries observed by such older composers as Yiannis Konstantinidis (1903–84), who wrote popular songs under the pseudonym Kostas Yiannidis. Whereas Konstantinidis, Kalomiris, and the other members of the National School employed Greek folk songs as the basis for classical compositions in the Central European manner, Hadjidakis offered an eclectic synthesis of art music and various types of popular song – including the Westernized cabaret song of the capital's bourgeoisie and the *rebetika* of its underclass – analogous to that created in the United States by his contemporary Leonard Bernstein. Hadjidakis announced his novel creative stance to the Athenian public in 1949 in a controversial lecture entitled "The Interpretation and Role of Popular Song". In this talk, excerpts of which were subsequently published, he scandalized many by placing *rebetika* on a par with folk song as an authentic expression of Greek culture and thereby a legitimate source of compositional inspiration. He further challenged inherited wisdom in 1953 with a series of lectures on modern American composers that were of fundamental importance for the development of Greece's postwar generation of classical musicians.

From the beginning of his career Hadjidakis demonstrated a preference for writing texted or programmatic music. In addition to composing film scores and incidental music for modern and ancient drama, Hadjidakis wrote several ballets, including *Six Popular Pictures* (op. 5, 1949–50) and *The Accursed Snake* (op. 6, 1950). Based on the eponymous karaghiozis shadow play, the latter work, for two solo voices and two pianos, was produced in collaboration with the noted puppeteer Evgenios Spatharis. Each of his first two creative periods also produced an important set of songs for voice and piano assimilating his relatively popular melodic and harmonic idiom to the tradition of the European art song: they are *Two Sailors' Songs* (op. 2, 1947), settings of poems by Miltos Sachtouris; and the *CNS Cycle* (op. 8, 1954), dedicated to Carlos Novi Sanchez, with homoerotic lyrics by the composer.

The advent of Hadjidakis's most prolific and financially profitable third period in 1957 was marked by incidental music for three plays: Iakovos Kampanellis's *Paramyhti Choris Onoma* (Nameless Fable, op. 11); a modern Greek translation by Thrasyboulos Stavrou of Aristophanes' *Lysistrata* (op. 12), including the hit song *Ena Mythos tha sas Po* (Let me Tell You a Story); and Odysseus Elytis's translation of *The Caucasian Chalk Circle* by Berthold Brecht (op. 13). With Nana Mouskouri as his primary interpreter from 1959 to 1963, Hadjidakis became, somewhat to his own surprise, a phenomenally successful composer of popular songs. An Academy Award in 1960 for the music he had written for Jules Dassin's *Never on a Sunday* brought him international recognition for his continuing work in the cinema, which peaked during this period with the composition of an astonishing 41 scores to Greek and foreign films. Typically, Hadjidakis took advantage of his new celebrity to advance the cause of contemporary Greek art music, in 1962 underwriting a competition for composers at the Athens Technological Institute that jointly awarded its first prize to Yiannis Xenakis and Anestis Logothetis. Two years later he founded the Experimental Orchestra of Athens, an ensemble which presented 15 world premieres of modern Greek works under his direction during its brief existence (1964–67). At the same time he continued to write many works for the stage, including an unfinished one-act opera aud the musical *Street of Dreams* (op. 20). Successful in rejuvenating the moribund genre of the Athenian revue, the latter was also one of Hadjidakis' first collaborations with the poet and lyricist Nikos Gatsos. Further settings of texts by Gatsos and other noted writers placed Hadjidakis alongside Mikis Theodorakis in the popular imagination as co-creator of the so-called popular art song of the 1960s and 1970s.

In what he described as an attempt to liberate himself from a kind of celebrity he did not want, Hadjidakis moved to New York. He remained abroad for the first five years of the dicta-

torship (1967–72), which he claims to have met with a policy of non-resistance "without acceptance". After writing only four film scores and some chamber music during his self-imposed exile, he returned to Greece and embarked on an ambitious series of subtly orchestrated vocal works beginning with *O Megalos Erotikos* (The Great Lover, op. 30), for two voices, choir, and 12 instruments on texts by Elytis, Gatsos, Cavafy, Solomos, and others. The fall of the colonels' regime enabled Hadjidakis to recommit himself to the advancement of classical music in his homeland through a series of important posts: deputy director of the National Opera (1974), controller of the Greek Radio's Third Programme, and general director of the State Orchestra of Athens (1975–82). Hadjidakis continued balancing composition, conducting, and arts administration in this way until his death in Athens on 15 June 1994. Particularly significant was his founding of the Orchestra of Colours to promote modern Greek composers through performances, recordings, and publications.

ALEXANDER LINGAS

Biography

Born in 1925 in Xanthi, Hadjidakis's family moved to Athens when he was seven. His studies were interrupted by the outbreak of World War II but he began composing music for the theatre in 1943. He also wrote film scores, ballets, and songs. He lived in New York from 1967 to 1972. Returning to Athens, he was general director of the State Orchestra (1975–82). He died in Athens in 1994.

Hadrian AD 76–138

Roman emperor

In an age of Roman philhellenism, Hadrian, the only Roman emperor (reigned AD 117–38) known to have been honoured with a statue in the Parthenon, was himself unusually actively philhellenic. In youth his interest in Greek studies had earned him the nickname "Graeculus". In AD 112 he was archon at Athens, where his friends included Arrian; he may also have met Epictetus at this time. After his accession as emperor in AD 117 he spent considerable periods in the Greek east; among the many instances of the Hellenic emphasis of his life are his wearing a beard (he was the first Roman leader to do so for many generations), his inclusion of a Poecile, a Tempe, and other Greek elements in his villa near Tibur (Tivoli), his initiation into the Mysteries of Eleusis (to which, according to Aurelius Victor, he continued to devote himself, back in Rome in the 130s, "after the manner of the Athenians"), and his "Greek love" relationship with Antinous (whose cult, fostered by Hadrian after Antinous' drowning in the Nile in AD 130, was particularly popular in Greek lands).

Hadrian – like many contemporary and earlier Romans and Greeks – sought to recover the Greek past. He delighted Greeks including Pausanias by restoring the tomb of Epaminondas. He gave back Mantinea its name after 150 years as Antigonea. In taking the name "Olympios" he associated himself not only with Olympian Zeus, whose temple in Athens he completed, but with Pericles, who had also assumed this name. In basing in Athens the Panhellenion, the all-Greek council established in AD 131/32, as in the honour he accorded to such cities as Sparta and Argos, he emphasized past glories, aiming perhaps, as Spawforth and Walker argue, to redress the balance between Achaea and Asia, between "cultural and historical eminence" and "economic and political muscle". (In Asia too, however, he was a benefactor during his visits of AD 123–24 and 129 to cities including Sardis, Smyrna, and Ephesus; Oresta was refounded as Hadrianopolis (Adrianople); at Cyzicus the emperor began the spectacular completion of the temple; Asian foundations included Hadrianutherae (modern Balikesir) in Mysia.)

Hadrian also, of course, sought to Romanize the Greek past or at least to recreate it, as Swain suggests, "in its idealised form" – "making Greece how it should be". In increasing the power of the Areopagus, for instance, he made the Athenian constitution more archaic – but "to the advantage of Rome and the local elite". Tested loyalty to Rome as well as authentic Greekness were conditions for cities wishing to belong to the Panhellenion; as Spawforth and Walker say, the cities' familiar preoccupation with questions of civic origin was transformed "at least indirectly, into a Roman concern ... encouraging a contemporary perception of the Greek past and the Roman present as complementary rather than mutually exclusive". Whatever the exact nature and functions of the Panhellenion – whether it was a new outlet for the social and political aspirations of upper-class Greeks (Spawforth and Walker) or rather "essentially a religious organisation, devoted above all to the cult of Hadrian and later emperors" (Jones) – it clearly involved a relationship between, negotiation between, Greeks and the empire. Hadrian's gate in Athens links and honours old and new with its inscriptions, on one side "This is Athens, once Theseus' city" and on the other "This is Hadrian's city, not Theseus'".

Similarly the buildings of Hadrianic Athens can be seen as "a stylish mixture of Greek and Roman traditions appropriate to the physical setting of a Panhellenic League founded by a Roman emperor" (Spawforth and Jones). Building went on for many years after Hadrian's visits of AD 124–25, 128–29, and 131–32, but among the first works to be begun may have been the temple of Olympian Zeus or Olympieion (in the *temenos*

(precint) of which the Panhellenion may have met), originally begun under Hippias and Hipparchus in the 6th century BC, and dedicated by the emperor in AD 132. The temple was built on a lavish scale, as is still apparent from its remaining columns. It was particularly renowned for its statues, including the ivory and gold cult statue, "worth noticing", according to Pausanias, "as it exceeds all other statues in magnitude except the Rhodian and the Roman colossi". At about the same time, probably, work began on Hadrian's Library or Stoa. This, says Pausanias, boasted 100 columns of Phrygian marble "and pavilions with gilded roofwork and alabaster, decorated with statues and paintings". Hadrian also built the aqueduct from Mount Parnes to the Agora, temples of Zeus Panhellenios and Hera, a gymnasium – 100-columned again, says Pausanias – a Pantheon, and, in the northeast corner of the Agora, a basilica.

Hadrian's cultural investment in Athens helped to transform it, during the course of the 2nd century, from "a provincial backwater by comparison with the great capitals of the eastern provinces at Antioch, Ephesus, or even at Corinth" (Shear) to a major and increasingly cosmopolitan centre. It became also, perhaps more directly as a result of Hadrian's personal initiatives, what Spawforth and Walker argue was "the agonistic centre of the Greek world": between AD 128 and 132 he founded the Panhellenia, the Hadrianeia, and the Olympieia and made the Panathenaia of equal status with these games. Perhaps even more helpfully, he provided the city with an annual grain supply. Already by AD 124–25 he had done enough for Athens for the city to reciprocate by doing him the unusual honour (last conferred on Attalus I of Pergamum in 200 BC) of creating the new *phyle* (tribe) Hadrianis; although this was possibly prompted in part by Rome or self-interest, it can scarcely have been a controversial decision.

The one area of the empire where Hadrian's Hellenism did not easily achieve the desired results was Judea, where the prohibition of circumcision and the decision to transform the ruins of Jerusalem into the *colonia* of Aelia Capitolina were among the main causes of the rising of AD 132–35 (indicating, for Birley, "that his Hellenism had blinded him to reality"). Elsewhere Greek influence was, increasingly, unopposed; Hadrian made a substantial contribution to this already powerful process, not only within the Greek lands but as the first emperor to "persuade the Greeks of old Greece to enter the Senate" and to appoint Greeks to govern provinces in the Latin west (Birley).

MARTIN GARRETT

Biography

Born in AD 76 in Spain, Hadrian was nicknamed "Graeculus" in youth for his devotion to Greek studies. In 112 he served as archon at Athens. He became emperor in 117 and spent long periods in the east where he sought to recover (and to Romanize) the Greek past, transforming Athens into a great eastern capital. He wore a beard to emphasize his Hellenism; he introduced Greek decor into his villa at Tivoli; he was initiated into the Mysteries of Eleusis; and he enjoyed a "Greek love" relationship with his friend Antinous. He died in 138.

Hagia Sophia

Former cathedral of Constantinople

The "great church" or cathedral of Byzantine Constantinople was Hagia Sophia – the church of the Holy Wisdom. This was located in the northeast of the city, within the Constantinian walls, north of the Augusteum and close to the Great Palace. The first church of Hagia Sophia on this site was dedicated in AD 360. Little is known, either from texts or from archaeology, of the 4th-century building, although it has been suggested that the domed two-storey structure usually identified as the sacristy of Hagia Sophia (the *skeuophylakion*) may be 4th or 5th century in date.

This first church was destroyed by fire early in the 5th century, and a new church was constructed on the site. The second (Theodosian) church was dedicated by the emperor Theodosius II in 415. There is more evidence for the form of this structure than for its predecessor, although only the west of the building has been excavated. It was a stone basilica with three doors from a narthex, decorated with a sculptural frieze depicting a flock of sheep, and a single line of columns forming a portico, leading down marble steps to an atrium. This building was also destroyed by fire, during the Nike riots in 532.

The emperor Justinian I (527–65) commissioned a new and larger church, to be constructed by Isidorus of Miletus and Anthemius of Tralles. Using marble and other resources from many parts of the empire, the new church was built on a massive scale. This church, dedicated in 537, was an architecturally novel and impressive structure. In plan it was a three-aisled rectangle, with galleries above the aisles. The nave was separated from the aisles by colonnaded arcades, and roofed by a huge dome surrounded by semi-domes. There was an eastern apse and a western narthex, also with a gallery. The galleries were entered by ramps situated in each corner of the church. To the west was an atrium, with a fountain in its centre, of which part (today known as the exonarthex) survives.

Excellent written descriptions of Justinian's church exist, and even today much of its fabric survives above ground. These enable detailed reconstruction of both the interior and exterior, and some understanding of its surroundings. The eastern apse contained a *synthronon* (shared throne) with semicircular steps for seating. The gold- and silverclad altar, positioned in the apse, had an altar cloth of purple embroi-

Hagia Sophia: symbol of Byzantine Christianity, the Great Church was converted to a mosque by the Ottomans and is a museum today

dered in gold and was covered by a ciborium with pyramidal roof. The altar screen was of silverclad marble. The stone pulpit (ambo), located slightly to east of centre of the church, was also magnificently decorated and partly silverclad.

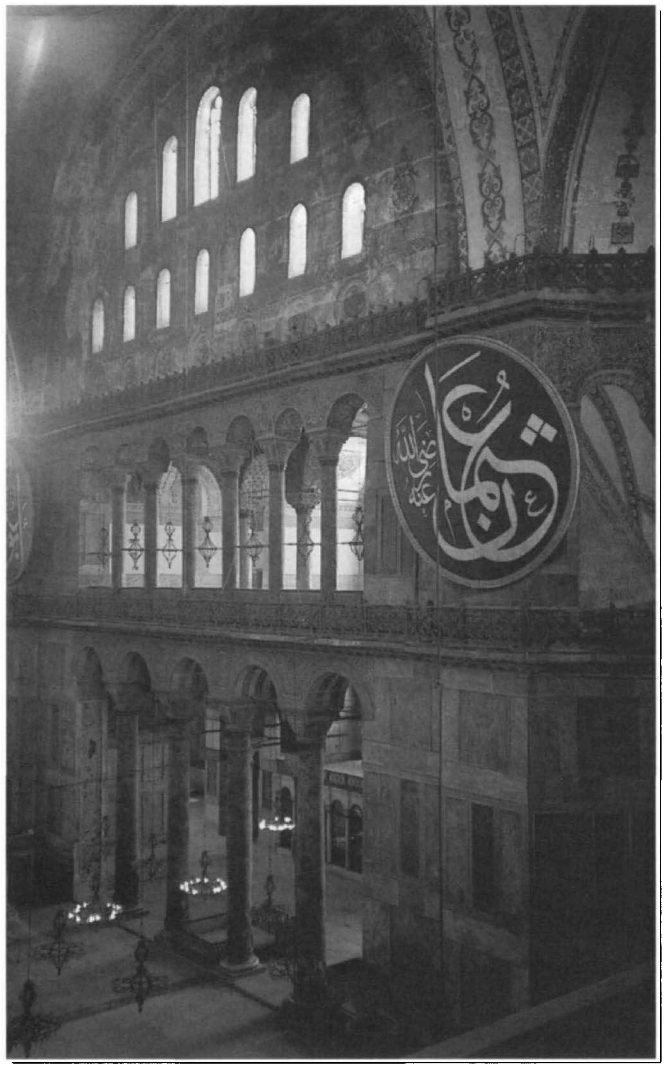
The elaboration of these furnishings was not matched by complex figural or decorative scenes in mosaic. Although parts of the building were decorated with a simple floral design of gold and blue, the ceilings seem to have been covered with simple gold mosaic rather than figural decoration. This gold mosaic decoration must have been especially impressive since the church had a sophisticated lighting scheme, in addition to glazed windows. Glass lamps were suspended from the ceiling, silver lamps hung by the columns at differing levels, lamps on iron stands were positioned both on the floor and above the level of the column capitals, and there was a ring of lamps around the base of the dome.

This church remained the centre of religious activity in Constantinople throughout the Byzantine period. It was used by both the court and citizens of the city, and the nave space was allotted by rank and gender. The church was also well positioned in relation to both religious and secular administration. The Patriarchate was situated immediately adjacent to the church to the southwest, where a very small portion of it survives, and a private porticoed passageway led from the Great Palace to the church.

Written evidence suggests that the 6th-century baptistery may have been to the north of the church, although the structure today identified as the baptistery is a surviving rectangular structure to the south of the church with an octagonal interior plan. As already mentioned, there was also a sacristy, and immediately north of the church were the hospital of St Samson and the church of Hagia Eirene, outside the complex.

Although this church remained in use throughout the remainder of Byzantine history, it was much restored and altered. As early as 558 the dome partially collapsed. This led to a rebuilding and heightening of the dome, with its diameter reduced, the addition of buttresses to the exterior of the building, and other modifications. A cross design was placed in the centre of the dome. The church was rededicated in 562, but was severely damaged in an earthquake in 989 and again restored.

The middle Byzantine church was very different in appearance from its early Byzantine predecessor, and it is from this building that most of the surviving mosaics in the church come. Unlike the early Byzantine cathedral, the 9th-century and later church had very elaborate figural mosaics. These included



Hagia Sophia: Byzantine mosaics and other decorative features survive alongside incongruous quotations from the Qur'an

depictions of the Virgin and Child in the apse, an image of Christ Pantocrator in the dome, and a depiction of the Virgin flanked by SS Peter and Paul on the west arch.

In 1204 the church was sacked by western troops, and subsequently used as a Roman Catholic cathedral during the Latin occupation. It was the coronation and burial place of the Latin rulers, and the tombstone of one of their leaders – Enrico Dandolo – can still be seen. There were a few modifications under Latin rule, notably the construction of a belfry. After the recapture of the city in 1261, the church was again restored. However, the building was damaged by earthquakes yet again, notably in 1346 and 1355, when the main dome was rebuilt on the last occasion and provided with another Pantocrator mosaic, perhaps the last Byzantine mosaic on this scale.

Hagia Sophia was in use for Christian services until the very end of the Byzantine empire. Legends surround the final moments of the church, but it was promptly emptied by Turkish troops immediately after their capture of Constantinople in 1453 and turned into a mosque. The building continued to suffer earthquake and other damage, and was restored many times, notably in the years 1847–49 by the Fossati brothers, when Byzantine mosaics were discovered. After the declaration of the modern Turkish republic the building ceased to be a mosque and was opened as a museum in the 1930s. More mosaics, discovered by Thomas Whittemore in that decade, were placed on display at that time, and these continue to give some impression of the church's middle Byzantine splendour. Today the building remains a museum, and is one of the principal tourist attractions of the city.

Summary

Hagia Sophia, the Church of the Holy Wisdom, was the cathedral of Byzantine Constantinople. The first church, dedicated in 360, was destroyed by fire in the 5th century and a second church was destroyed during the Nike riots in 532. The third, still extant, building was commissioned by Justinian and dedicated in 537. It was the centre of religious activity in the city throughout the Byzantine period. The Ottomans turned it into a mosque in 1453. Today it is a museum.

Hagiography

Hagiography denotes written documents of all varieties that are relevant to the cult of saints. The purpose of hagiography is to record information on canonized people, thus providing edifying examples of Christian lives.

Hagiographical documents may be schematically divided into two types: the liturgical and the literary. An example of liturgical hagiography are the *Menaia*, in 12 volumes corresponding to the months of the year which include full information (a notice of the life with canons and tropes) about the saints to be commemorated each day; modern versions of a medieval service book, the Menaia, are the *Megas Synaxaristis tis Orthodoxou Ekklisias* (The Great Lives of the Saints of the Orthodox Church). The *Menologion* (Calendar), which is similarily divided by months, gives only the lives of saints. The Menologion was very widely disseminated in the Byzantine world, often with illustrations; the best-known version is that compiled in the mid-10th century by Symeon Metaphrastes, who standardized at a rather formal linguistic level many of the varied texts inherited from the past. The *Synaxarion* gives short notices on saints to be included in the daily office; the *Synaxarion of Constantinople*, probably also compiled in the 10th century, provides a full and interesting collection of material. *Typika*, that is, liturgical calendars giving instructions for each day's services, include notices on saints to be commemorated; from the 9th century three were in general use: that of the Great Church and two monastic types, the Studite and that of Mar Saba.

Many of the notices found in this liturgical material were constructed on the basis of literary hagiographical documents, that is, on the lives of the saints *(bioi* in Greek, *vitae* in Latin. These literary hagiographical documents are several types. In the 2nd and 3rd centuries the early Church had developed an edifying literature in the form, for example, of apocryphal gospels or accounts of apostles' missionary journeys; the journeys of St Paul and St Thekla are well-known instances with more than a hint of the novel. There also developed accounts of mayrtyrdoms (*martyria* in Greek, *passiones* in Latin, often called passions in English) which dealt not with the entire lives of saints but with the process, often gruesome, by which they met their deaths. Collections of sayings *(Apophthegmata Patrum)* are not strictly lives of saints, for they consist of series of gnomic utterances from groups of ill-defined but holy personalities, usually desert hermits, without a narrative structure. Finally there are narrative lives of a sort which would become conventional. There is often a formulaic quality to these: a pious child exhibits early prodigies of asceticism, overcomes temptations of sundry kinds, and ultimately leads a life whose sanctity is fully recognized only at death.

The genre of saintly life owes something to the traditions of ancient secular biography. Eusebius' *Life of Constantine* (written *c.*337–39) is already an example of a biography in which historicity is subordinated to a polemical and didactic purpose. This trend can be seen much more sharply in Athanasius of Alexandria's *Life of Antony* (*c.*356), often taken as the first example of a hagiographical Life; here the miraculous is accepted as normal and the regular passage of chronological time is immaterial. This is a pattern that is found regularly in subsequent lives, such as that of Theodore of Sykeon (d. 613), in which miracles are part of everyday rural life.

From the 4th to the 7th centuries the main centres for the writing of hagiography were Egypt, Syria, and Palestine. Lives of the monks of the desert monasteries, who had withdrawn from city life (and often from communal life also) were written, for example, by Palladius, whose *Lausiac History* on the monks of Egypt was written *c.*419; by Theodoret of Cyrrhus (d. *c.*466),who wrote a *Religious History* on Syrian monks; and by Cyril of Scythopolis (d. *c.*559) who compiled biographies of monks in Palestine.

Between the 7th and 9th centuries, the Byzantine dark ages, few hagiographical texts were produced. From the 9th to the 11th centuries the genre revived. Saintly heroes of this time were much involved with community life, whether founding monasteries, as did Lazaros of Mount Galesios (d. 1053); being the pious mother of a family, as was Mary the Younger (d. *c.*902/3); or playing an active political role, as did Euthymios, patriarch of Constantinople (907–12). It is at this time that the Menologion of Symeon Metaphrastes was compiled. In the 12th century, when interest in secular literature revived, once again relatively little hagiography was written – though what there was came from prominent literary men such as Theodore Prodromos (*Life of Meletios*) or John Tzetzes (*Life of Lucia*). In the 13th and 14th centuries there were a number of prolific hagiographers, such as Constantine Akropolites (d. before 1324), and a variety of approaches, including encomia of past saints and lives of prominent contemporaries, such as the emperor John III Vatatzes (*c.*1192–1254), or the patriarch Athanasios I (d. *c.*1315).

The saints whose lives have been recorded came from many walks of life: they include monks, desert hermits, holy fools, pillar-sitting stylites, military commanders and humble soldiers, empresses and prostitutes (though women are under-represented). The process of acquiring sainthood in the medieval Greek world was informal (the first official canonization in the Orthodox Church appears to have been that of the Patriarch Arsenios in the late 13th century). It depended on a reputation for sanctity and, usually and preferably, for working miracles. From that would develop a cult which would lead to the painting of an icon and the writing of a life.

Many lives are written by named and known authors, some of whom are mentioned above. Other significant hagiographers include Leontios of Neapolis (7th century), author of lives of John the Almsgiver and Symeon of Emesa; John Moschos (d. *c.*634), author of the *Spritual Meadow*, a set of anecdotes about the monastic communities encountered during his travels; Ignatios the Deacon (d. *c.*845), author of a life of the patriarch Tarasios; Niketas David Paphlagon (early 10th century), author of about 50 encomia on saints; and Philotheos Kokkinos (patriarch of Constantinople 1353–55), a prolific writer on his contemporaries. Many lives are anonymous, especially the early *martyria*.

The audience and readership for hagiographical material in the Byzantine world would have been extensive, whatever the extent of literacy, over which scholarly uncertainty continues. Liturgical passages were read out during church services and so would have been heard by entire congregations. Longer lives would have been used for devotional reading, whether as part of monastic discipline or in a domestic environment. Anna

Komnene in the mid-12th century refers to her mother reading lives of saints, and such lives are recorded in the private library of Eustathios Boilas (d. 1059), so that it is possible to think of hagiographical narratives as the recreational literature of the medieval world.

Hagiography has continued to serve devotional purposes up to the present and the lives of post-medieval saints appear in service books. It also has value for the historian, providing useful insights into the thought of its producers and consumers. From hagiography much information can be gleaned about medieval religious beliefs and practices, about the artifacts of daily life, and, with careful sifting, many incidental details on historical events. A very significant role in the scholarly study of the genre has been played by the order of Bollandists, active in Belgium from the early years of the 17th century to this day, and their monumental series *Acta Sanctorum*.

Halicarnassus

City in southwest Asia Minor

Halicarnassus (modern Bodrum) was a Greek city in Caria in southwest Asia Minor, traditionally founded *c.*900 BC by the city of Troezen in the Argolid region of mainland Greece. With a superb sheltered position on the Mediterranean coast, the orientation of Halicarnassus was naturally outwards towards the Aegean rather than inwards towards the mountainous areas of inland Caria. The city had close ties with other east Greek cities given its position on shipping routes connecting them. In the Archaic period Halicarnassus was one of the cities of the "Dorian Hexapolis" (a loose federation of six cities of Dorian Greeks, which also comprised Cnidus, Cos, and the three cities of Rhodes, Lindus, Camirus, and Ialysus), but by the Classical period the city was Ionian with strong native Carian elements, although Caria as a whole was ruled by a local dynasty subject to the Great King of Persia. Herodotus, the Greek historian of the 5th-century BC wars between the Greeks and the Persians, was a native of Halicarnassus.

Given Persia's suzerainty in the region, Halicarnassus took part in the Persian Wars on the Persian side. The Carian dynast Artemisia I with five ships accompanied the invasion of Greece by the Great King Xerxes in 480 BC, and played a distinguished part in the sea battle off Salamis (recounted by Herodotus, 8. 88), although the battle was a Greek victory. Later, Halicarnassus became a member of the Delian League under the leadership of Athens, and served as an Athenian naval base at the end of the 5th century.

The 4th century BC was the zenith of Halicarnassus. The dynast Mausolus, who became the Persian satrap after Halicarnassus returned to Persian control in 386 BC, moved his capital there from the inland city Mylasa *c.*370 BC, synoecized (united into one city) neighbouring non-Greek settlements, and embarked upon an ambitious building programme to transform Halicarnassus into a grand city. He built fortification walls, a palace, harbour installations, a Greek-style theatre, various public buildings, and revealed a considerable familiarity with, and appreciation of, Greek culture. He meddled in 4th-century Greek politics in the Aegean to the detriment of the Second Athenian Confederacy, and extended his influence in Asia Minor and the Aegean.

Halicarnassus was justly famous for the great tomb of Mausolus, known as the Mausoleum, probably begun during his lifetime and completed *c.*350 BC after his death. This monument was a major achievement of Greek art and was considered one of the seven wonders of the ancient world in Hellenistic and Roman times. Built in a commanding position overlooking the harbour, the tomb would have dominated the city and served as a landmark to seafarers. Information about the Mausoleum is derived from ancient literary descriptions and extensive excavation, and, although it has been variously reconstructed, it essentially consisted of an Ionic colonnade atop a high square podium, surmounted by a pyramidal roof. The building was adorned with quantities of free-standing sculpture and several relief friezes. Mausolus had the money and influence to employ the leading Greek sculptors of his day (among them Scopas of Paros, Leochares of Athens, Bryaxis, and Timotheus). The pyramidal roof was a striking feature, perhaps inspired by eastern prototypes (the pyramids of Egypt have been proposed as among the Mausoleum's forerunners).

The Mausoleum had many imitators. To name but a few: Alexander the Great (who surely saw the Mausoleum when he besieged Halicarnassus – see below) built at Babylon an immense pyramidal tomb composed of six stepped levels for his beloved companion Hephaistion after his death in 324 BC. Moreover, Alexander's proposed "Last Plans" (if genuine) included a pyramidal tomb for his father Philip II (Diodorus Siculus, 18. 4. 5). Finally, the famous Lion Tomb in the independent Greek city Cnidus, which lies at the tip of a peninsula just south of the Bodrum peninsula, was topped by a stepped pyramid supporting a platform for an enormous recumbent lion.

Halicarnassus: marble frieze showing battle between Greeks and Amazons from the Mausoleum, *c.* 350 BC, British Museum, London

The smooth course of Alexander the Great's progress down the east coast of Asia Minor during his invasion of the Persian empire was interrupted when Halicarnassus offered resistance, but the city finally fell in 334 BC after a difficult siege (vividly described in Book 1 of Arrian's *Anabasis*). After Alexander's death, Halicarnassus – like other Greek cities in Asia – could not escape the power struggles of his successors, and it was subject at various times to the new Graeco-Macedonian Hellenistic kingdoms (the Ptolemies of Egypt, the Seleucids of Syria, and the Antigonids of Macedonia) as well as to the independent Greek island of Rhodes. It became part of the Roman province of Asia in 129 BC.

During the Byzantine period, Halicarnassus was the seat of a bishop under the metropolitan of the city of Aphrodisias in northeast Caria. It faced capture by the Turks, the Crusaders, the Hospitaller Knights of St John (who in the 15th century AD built the magnificent Castle of St Peter in the harbour of Bodrum largely from blocks of the Mausoleum, whence much of it was recovered), and finally by the Ottoman Turks in the 16th century. Its last appearance in Greek history was the unsuccessful rebellion of the city against Ottoman rule in AD 1770, supported by the navy of Catherine the Great of Russia. After the upheavals of World War I and the fall of the Ottoman empire, Halicarnassus became part of the modern state of Turkey.

Summary

A city in Caria, southwest Asia Minor, Halicarnassus (modern Bodrum) was traditionally founded by colonists from Troezen *c.*900 BC. It was the home of the 5th-century BC historian Herodotus. It reached its peak in the 4th century BC under King Mausolus whose tomb, the Mausoleum, was one of the Seven Wonders of the ancient world. The Castle of St Peter was built by the Knights of St John.

Harbours

Because the Greeks have been a seafaring people since before recorded history, harbours have always played an important part in their life. Certainly the rocky terrain of mainland Greece, and settlement on the islands of the Aegean, encouraged travel by sea as opposed to travel by land. Yet, as Lionel Casson, the naval historian, points out, it was possible to load and unload ships lying off an open beach without using harbour installations until well into the 19th century AD, so the absence of harbours did not necessarily preclude a city or island from participating in seafaring. In the early days, ships could even be drawn up on to shore, literary evidence of which can already be found in the *Iliad* and *Odyssey*, presumably composed in the 8th century BC. Nevertheless, the importance of harbours even at this early date may be reflected in the fact that Nestor led to Troy 90 ships, the second biggest contingent of the Greeks after Agamemnon's 100, according to the catalogue of ships in book 2 of the *Iliad*. (Indeed, some scholars have argued that the catalogue of ships may reflect an actual Mycenaean order of battle for some historical event underlying the myth of the Trojan War.) According to tradition Nestor was also associated with the magnificent natural harbour at Navarino bay in the western Peloponnese, while archaeological finds have linked him with the Bronze Age palace found near the bay.

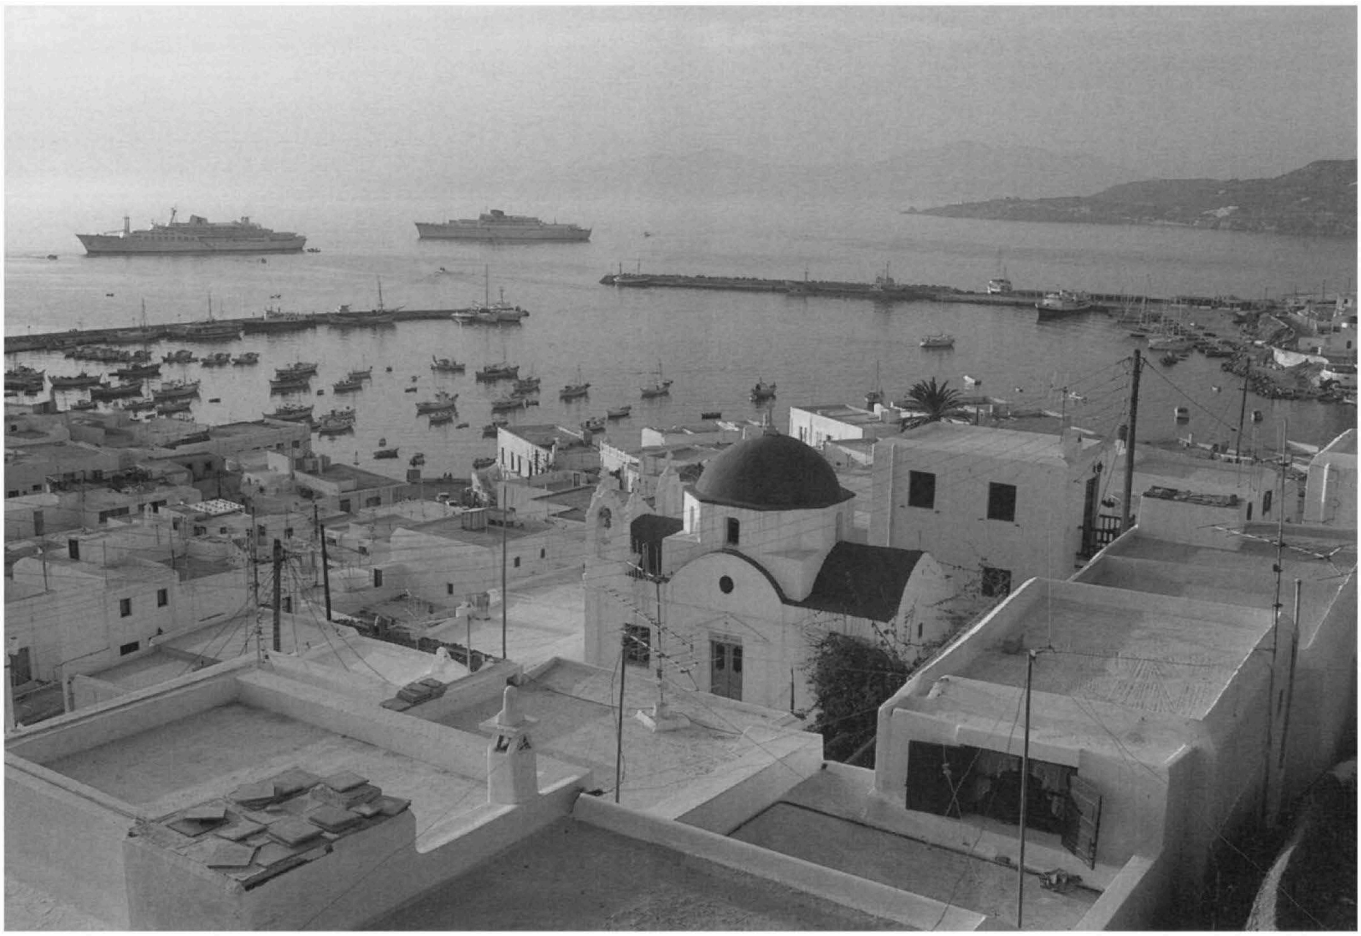
The *Odyssey* depicts the mythical Phaeacians as living almost in a fairy-tale land, and, among their many blessings, endows them with an idealized harbour consisting of a protective bay with sheds for the storage of sails and rigging, stone bollards for tying ships to, work space for sailmakers, riggers, and shipwrights, and a shrine to Poseidon, surrounded by a meeting place (*Odyssey*, 6. 263–69). These features may be taken as the desiderata of a Greek harbour of the Archaic period. Actual harbours did not lag far behind this poetic one, and soon surpassed it, as in the harbour at Delos with its 8th-century BC mole, 100 m long, constructed from rough-hewn granite blocks. The Phaeacians depended on nature alone for a protected anchorage. At the end of the 6th century BC the tyrant Polycrates built a harbour at Samos comprising two moles, one 370 m long and the other 180, and included it within the circuit of the city's defence wall (Herodotus, 3. 60). Also at the end of 6th century BC, according to the pseudo-Aristotelian *Constitution of Athens*, the tyrant Hippias began fortifying Munychia in the Piraeus, even though Athens continued to use the open roadstead at Phalerum as a harbour until about 493 BC.

At the beginning of the Classical period the ideal Greek harbour had moles (*chomata*) to provide a safe anchorage (*hormos*). A commercial harbour (*emporion*) had quays, open sheds (*neosoikoi*), and warehouses, whereas a naval base (*neorion*) had boathouses (*neosoikoi*) and gear sheds (*skeuothekai* or *hoplothekai*). Defence towers stood at the seaward end of the moles and, being brought within the circuit of the town wall, made it a protected harbour (*limen kleistos*). In fact, several cities in the Classical period went so far as to join their harbours to their cities with long walls, most famously Athens and the Piraeus, Corinth and Lechaeum, its port on the Corinthian Gulf, and Megara and Nisea, its port on the Saronic Gulf. In the Piraeus, Pashalimani (ancient Zea) and Tourkolimano (ancient Munychia) in the Piraeus were *neoria*, whereas Megas Limin (ancient Cantharus) served as both an *emporion* and as a *neorion*, as indeed it still does today. The presence of the harbours, and their use as commercial and naval centres for Athens beginning in 493 BC with Themistocles' founding of a navy to repel Xerxes' invasion, led to a lot of construction in the Piraeus. In about 450 BC Hippodamus of Miletus imposed an orthogonal city plan on the Piraeus which is still reflected in the layout of the modern streets.

Pashalimani in the Piraeus has the best-preserved boathouses, served by a stone slip *c.*3 m wide and 37 m long. (From these dimensions Morrison and Coates have derived the size for their recent reconstruction of the trireme.) The boathouses' roof was supported by columns each just under 6 m wide; the use of columns instead of a solid wall allowed for ventilation. The boathouses stored ships and wooden gear (masts, yards, poles, ladders, and oars). Oeneiadae in Acarnania had longer boathouses with bevelled slips to fit the ships' bilges, and they are therefore thought to have accommodated quadriremes or quinqueremes, larger than the triremes presumably housed at Pashalimani. The Piraeus also had an elaborate gear shed, built in the 4th century BC and known as the arsenal (*skeuotheke*) of Philon; considered something of an architectural wonder, its details are known to us from an inscription (*IG* 2^2, 1668). By the end of the 5th century BC, the essential elements of the commercial harbour in the Greek world had been worked out, becoming more elaborate and increasing in size in later centuries.

The harbours of the Hellenistic age were of vast size and integrated plan. The premier harbour of the period was of course at Alexandria, the city Alexander the Great founded in 330 BC and named after himself. Its plan was crowned by the famous Pharos, a lighthouse which was one of the seven wonders of the ancient world and the light of which could be seen from about 50 km away. There were two basins at Alexandria, the Great Harbour, which faced east, and the Eunostos, which faced west. The Great Harbour was formed by two stone moles (one of which was 900 m long), the tips of which were 600 m apart, though underwater obstacles reduced this opening to two entrances, 100 and 200 m wide, respectively. Such a plan, dominated by a lighthouse, probably influenced the Roman emperors Claudius and Trajan in developing the facilities at Ostia for the reception of the grain fleet from Egypt, for, when Trajan had finished with it in the early 2nd century AD, Ostia also had two harbours dominated by a lighthouse.

Also in the Hellenistic age, Delos became a commercial centre for trade in the Aegean, as well as continuing to be an



Harbours: Mykonos, the principal harbour for those visiting Delos. The slavers of the ancient world have been replaced by the cruise liners of today.

important shrine to Apollo. Inscriptions show that it was a centre of the slave trade, and the Romans deliberately fostered it as a trading rival to Rhodes, expelling the Delians in 166 BC and replacing them with Athenian settlers. In 146 BC Corinthian importers moved there from their own city which had been sacked by the Romans, and the religious festival in honour of Apollo on Delos practically became a trade fair. Delos, however, never recovered from the depredations of Archelaus, the general of Mithridates of Pontus, and pirates in the 1st century BC, and went into a slow decline thereafter.

Since, as Lionel Casson points out, Byzantine ships were, if anything, smaller than their Classical counterparts, harbour installations were even less necessary for handling cargoes. Nevertheless, the Byzantines continued to use those harbours, such as Alexandria, which they inherited from the Romans, and built new ones, for example on the Golden Horn at Constantinople. It was the presence of a harbour at Ravenna that partly led to the establishment of an exarchate there following the reconquest of parts of the Italian peninsula by emperor Justinian in the early 6th century AD, even though the port was already beginning to silt up. In addition, ports like Nauplia, the best harbour in the Argolid, fell into crusader and then Venetian hands after the Fourth Crusade of 1204, and became the focus of intermittent struggle between their owners and the Turks during the following four centuries or more.

During the Tourkokratia, many harbours fell into relative disuse, owing to a lack of interest in trade on the part of the Ottomans. Piraeus, for example, was virtually uninhabited in 1834, when the capital of newly independent Greece was moved to Athens. Its growth in population, from 4000 in 1840 to 11,000 in 1870, to 75,000 in 1907, is an index to the revival of the city of Athens, and the tripling of its population in 1922 testifies to a massive resettlement of refugees from Asia Minor. The harbour at Navarino bay played an important part in the War of Independence when, on 20 October 1827, a combined British, French, and Russian fleet of 26 ships trapped and defeated a larger Turkish fleet of 82, sinking 53 of them. Furthermore, Greek predominance in shipping in the modern era has been enhanced by its many fine harbours.

Healing Cults

A genuine human desire to turn towards higher, spiritual forces beyond "scientific" medicine in times of illness and distress manifested itself very early in Greek culture. Already Linear B tablets from Knossos are addressed to "Paieion" ("Pa-ya-wo-ne") who receives votives of limbs in Palaikastro about 1600 BC (Middle Minoan) and is the doctor of the gods also in the *Iliad* (5. 401, 899f.); he will later amalgamate with Apollo. Apollo's son Asclepius is still a mortal in the *Iliad*, but already a "doctor without fault" (4. 194); not only his two sons, Machaon and Podalirius, but also other heroes such as Patroclus act as physicians if the need arises. Likewise the seer (and later healing hero) Amphiaraus was originally a battle hero, participating in the war of the "Seven against Thebes"; when his army was routed, Zeus would not let his seer die, but conveyed him into the underworld alive by splitting the earth before him. Afterwards, Amphiaraus was revered as a healing and oracle-giving hero, with musical and sports contests (Amphiareia) being held in his honour.

The overall increase of hero cults in the 7th and 6th centuries BC also led to an intensified worship of healing heroes. Above all in Attica there existed plenty of healing gods and heroes, among them heroified historical persons (e.g. Hesiod in Orchomenus; in Athens, Sophocles became the hero Dexion, after he had received the god Asclepius). Almost every other god and goddess could assume healing functions, too, above all Apollo; Artemis cared especially for pregnant women, newborn babies, and young children, and Athena was already in the 6th century BC worshipped as "Athena Hygieia" on the Acropolis.

This variety of healing cults was very much reduced when from about 420 BC onwards Asclepius became the most prominent healing god. His cult first seems to have existed in Thessaly (Trikka) and Messenia; his most important place in the later 5th century BC was Epidaurus, whence the cult spread to Eleusis, Delphi, Paros, Corinth, Cos, Pergamum, and in 420 BC (during the plague) to Athens; in these transfers, Asclepius' holy snake was brought by ship or cart to its new place. The only other healing cult that continued was that of Amphiaraus; his main sanctuary was the Amphiareion in northeast Attica, with a branch established in Athens itself near the Theseum between 377 and 375 BC. Iconographically Asclepius is often represented as a bearded elderly man wrapped in a garment and carrying a stick (Amphiaraus is similarly depicted from the 4th century BC) and together with his family: his wife Epione, his sons Machaon and Podalirius, his daughters Hygieia, Aegle, Aceso, Iaso, Panaceia, and later also with a dwarf called Telesphorus ("who brings to a good end") who is either his son or his servant.

In Hellenistic and Roman times, healing cults and Asclepieia spread through the whole Aegean and beyond. The increasing popularity of these cults coincided with the rise of scientific medicine, which may seem paradoxical at first sight. The basic attitude of ancient doctors was different from that of today. According to Hippocrates, a physician has to do three things: first, to describe the case; second, to draw conclusions about the kind of illness; and finally to decide either "I will treat this illness" or "I won't treat it". In the latter case the sick needed an alternative to whom they could turn, and at this point healing gods and heroes came in.

The best-preserved healing places – the above-mentioned Amphiareion near Oropus (not far from the Boeotian border) and the Asclepieia in Epidaurus and Cos – all show the same main elements: the sanctuary of the god, an incubation hall (see below), baths, a theatre, and guesthouses for the pilgrims; most of these buildings were constructed in the 4th century BC, when the importance of healing cults reached a first climax. The famous theatre of Epidaurus has space for 15,000 spectators, a measure of the immense popularity of the cult. Such additional amenities created the atmosphere of a "holiday resort" and may have been important for the well-being and curing of the visitors. Certain rules of behaviour had to be observed; dying people or women giving birth were denied access, for they would cause religious impurity.

Healing was mainly sought by the process of "incubation", i.e. sleeping in the sanctuary. The patients first had to make a purificatory offering, sacrificing an animal at the altar in front of the temple. After physical cleansing in the baths, patients laid themselves down to sleep on the skin of the sacrificed animal in the *koimeterion* or "incubation hall", a long columned hall, which could be partitioned into small compartments. The god then approached people in their dreams by touching them either with his own hand or with one of his holy animals, the snake or the dog (both already companions of oriental healing gods), which bit or licked the spot where the patients were suffering. The healed placed votive offerings – imitations of limbs in various materials and reliefs depicting the healing – in front of the temple; when the more precious items (in gold, silver, and bronze) were later melted down, an inscription noted the shape of the votive, its donor, and its weight. Tales of miraculous healings were preserved on wooden or marble tablets; in Epidaurus they were collected and inscribed on big marble stelai (1.70 ¥ 0.75 m) in the second half of the 4th century BC; three of these, containing 130 healing miracles, are still extant. It is difficult to form an adequate judgement of these "miracles"; but as modern medicine has long since acknowledged the importance of psychological factors in healing, one should not talk of "cheating", as scholars did in the 19th century. Frequently mentioned in these tales are eye complaints (in the *Plutus* of Aristophanes, the god of wealth himself is cured of his blindness in the course of a very funny incubation), paralysis, speech disorders (the god often cures muteness by a sudden shock), ulcers, abscesses, old sores (in the case of which the god often performs spectacular surgery), and everything connected with pregnancy and desire for children. Interestingly, Christian tales of miraculous healings by saints (as found in records from their holy places) are very similar to these pagan ones; even in our time, observation (in places such as Lourdes) has shown that religious ecstasy can induce spontaneous healing.

There was a second flourishing of healing cults in the 2nd century AD, with the Asclepieion of Pergamum being one of their foremost places; even leading intellectuals such as Aelius

Healing Cults: the Asclepieum at Pergamum, where the cult of Asclepius was brought from Epidaurus in the 4th century BC

Aristides eagerly sought their help. Healing divinities preserved their appeal well into the mysticism of late antiquity; by the 4th and 5th century AD, however, they were increasingly superseded by Christianity (with Christ himself often acting as healer).

Not all places of pagan healing cults were destroyed in late antiquity, but often they were transformed into places of Christian cult, with Christian saints taking over the duties of their pagan predecessors. In Byzantine times miraculous healing could still be brought about by incubation in churches at a holy place; other cures consisted of kissing the tomb of a saint, anointing oneself with oil from the lamp that was suspended above a saint's tomb, drinking oil or water that had come into contact with the saint's relics. From the 4th century AD onward, such relics (the mortal remains of holy persons or objects sanctified by contact with them) were often transferred to various local churches and developed a significant role in healing. Another source of miraculous healing was provided by icons. The Second Council of Nicaea in AD 787 laid down certain principles of icon veneration and in particular acknowledged the powers of miracle-working icons, which had already a centuries-old tradition behind them; above all, *acheiropoieta* (images "not made by human hand", but mysteriously found) were regarded as miraculous. There was an exemplary case of this even in more recent times: on the island of Tinos (on which already in antiquity a great festival for a Poseidon with healing powers had existed) a miraculous icon of the Virgin Mary was found in the early 19th century and provided important moral support to the Greeks fighting for their independence; the icon was placed in the church of Panagia Evangelistria (finished in 1830) and quickly became the most important centre of pilgrimage for healing in the Orthodox world; the Panagia Tiniotissa is now the patron saint of Greece.

Health

The standard Greek words for health (e.g. *hygieia, euexia*) do not appear in Homeric and Hesiodic epic, but "disease" (*nousos/nosos*) is a significant theme ever since the tenth line of the *Iliad*, and freedom from disease is depicted as belonging to a faraway land (*Odyssey*, 15. 407–08) or to a lost golden age (Hesiod, *Works and Days*, 90–126). Once the Greeks developed more fully articulated conceptions of "health" in the Classical and Hellenistic periods, they disagreed vigorously among themselves about how to define it, how to achieve it, and where to rank it among the human goods.

1. *Conceptions and definitions of health.* Balance, harmony, due proportion, equilibrium, regularity, and proper mixture or blending ("temperament") were central to the Greek understanding of health in most epochs, but there was no consensus on exactly what constitutes a "harmony", a healthy blending, etc. Furthermore, a significant minority adopted a very different approach to health. The 5th-century BC philosopher-scientist Alcmaeon of Croton might have been the first to claim that the "equal rights" (*isonomia*) of opposing qualitative powers (moist–dry, cold–hot, bitter–sweet) in the body preserves health, whereas a "monarchy" of any single such power causes disease (but the late 1st-century AD doxographic text that attributes this view to Alcmaeon displays suspect, anachronistic terminology). This conception of health recurs in Greek philosophical and medical texts until the Early Modern period. According to the Presocratic Diogenes of Apollonia, for example, health depends on a proper mixture of blood and air in the body, while the Hippocratic treatise *On the Nature of a Human Being* argues that health exists to the greatest degree whenever four juices or humours "that are in the body" – blood, phlegm, yellow bile, black bile – achieve the right quantitative and qualitative proportions relative to one another. For all their strong disagreements about the basic constituents of the human body, several other Hippocratic texts (e.g. *On Ancient Medicine*, *On Regimen*) as well as Empedocles, Democritus, Philistion of Locri, Plato, Aristotle, Galen, and most Byzantine physicians and philosophers shared this fundamental theory that good health is due to a right blending (*krasis*) or balance of constitutive elements or qualities or substances, whereas disease is due to a rupture of such a blending or balance, resulting in a separation or disproportion of elements, etc.

The quantitative implications of balance and proportionality sometimes were given mathematical expression, notably by the Pythagoreans. They not only characterized health as a harmony and an "equality of parts" (*isomoiria*) of opposites but also called their "perfect number" – the decadic *tetraktys* (i.e. 10 as the sum of 1, 2, 3, and 4) – "the principle (*arche*) of health" and referred to their mathematical symbol of identity (a pentagram) as "health". Furthermore, they advocated the use of music, which they viewed as a mathematical phenomenon, to maintain or restore harmony in the body. Some of Plato's theories of due proportion and mixture are not unrelated to the Pythagoreans' mathematicizing versions of health, but Plato perhaps elaborated the moral and aesthetic dimensions of such a conception more fully, closely correlating health, the well proportioned, the good, and the beautiful (e.g. *Timaeus*, 87c–d).

"Health of the soul" (*psyche*) was often explained in the same terms as physical health. Indeed, a number of Greeks, early and late, viewed health as a condition or disposition of a unitary psychosomatic entity. Closely related was the popular association of physical and mental health with moral uprightness (and, correspondingly, the attribution of diseases, including mental disorders, to moral failings, a recurrent notion in Greek popular culture of all epochs, especially when accompanied by the ascription of illness to divine intervention). Many physicians, including some Hippocratics, Aretaeus of Cappadocia, Soranus of Ephesus, Galen, and later writers, explained mental health by reference to relations or interactions between material elements or substances in the body. At times, however, philosophers – including those who, unlike Plato, offered a materialist account of the soul – attempted to draw sharp distinctions between physical and mental or "psychic" health. Some Stoics, for example, defined the health of the body as a good blend (*eukrasia*) or due proportion (*symmetria*) of the four elementary qualities (hot, cold, wet, dry) but the health of the psyche as a good blend of the opinions of the soul.

2. *Attaining and maintaining health.* The theories of balance, harmony, and proportionality are closely related to a broader ideology of moderation. Critias, for example, suggested in an elegy that the moderate drinking practised by the Spartans is fitted beautifully to health and to the works of Aphrodite, sleep, and temperance ("the neighbour of piety"), while Xenophon attributed the extraordinary health of the Spartans to their moderate eating habits. Similarly, in a comic fragment of Eubulus, Dionysus limits those who are healthy in mind to three kraters of wine: the first for health, the second for eros, the third for sleep; with the fourth krater, he says, one leaves the realm of Dionysus and enters that of hubris. Several Hippocratic treatises (e.g. *Affections*, 49) similarly claim that smaller quantities of food are better for one's health. The frequent ancient Greek criticisms of the excesses characteristic of athletes' diets and exercises, and so too the clear distinction drawn by some physicians between steady good health and exceptional physical strength, are further manifestations of a wide-ranging cultural valorization of moderation, even if there often were considerable gaps between belief and practice.

Starting in the 5th century BC a sizeable body of Greek literature developed on the preservation and restoration of health by means of regimen (*diaita*), i.e. by a stable mode of living,

including diet, exercise, bathing, and other regular habits. Herodicus of Selymbria was widely regarded as being among the founders of this tradition, but the 5th-century BC Hippocratic treatise *On Regimen* is the first extant work offering detailed, comprehensive norms for human regimen with a view to health, while also taking account of individual differences in age, gender, season, constitutional type, location, environment, etc. The fundamental tenets of this Hippocratic text remained a cornerstone of much subsequent work on regimen. Many of its prescriptions entail self-control, also in matters of eating and drinking, and this has suggested to modern scholars that its audience – like that of most ancient and Byzantine treatises on health through regimen – was assumed to have an ample food supply. In reality, food shortages were endemic in the ancient Mediterranean, even if not all food crises were severe. The primary audience of the extensive Greek medical literature on regimen therefore probably was a literate socio-economic elite. Palaeopathological analyses of skeletal remains confirm that certain nutritional deficiencies were common throughout antiquity. Not all such deficiencies are attributable to catastrophic food crises (nor are all recurrent congenital diseases, rheumatic ailments, cases of dental caries, etc.), but it is nonetheless striking that evidence of deficiency, also in children, is at least as common as evidence of dietary excess, even at times of economic prosperity.

Other Greek writers on achieving health through regimen include Acron of Agrigentum, Philistion of Locri, Diocles, Mnesitheus, Dieuches, Praxagoras of Cos, Herophilus, Erasistratus, members of the Empiricist "school", Galen, and numerous early and late Byzantine authors, e.g. Oribasius (especially books 1 and 4), Hierophilus the Sophist (*On Nutriment according to the Months*, i.e. the months of the Julian calendar, and *On the Faculties of Nutriment*), and Symeon Seth.

None of these works was more influential than Galen's monumental *Health* (*Hygieina*) 1–6 and *On the Faculties of Foods* 1–3. In *Hygieina* Galen assigned the preservation of health to "hygiene" ("the art of health") but the restoration of health to therapeutics. His *Health* is based on the classical theory of a due proportion and blending of four primary qualities (hot, cold, wet, dry) and of four humours. Not every deviation from the normal humoral proportions results in a disease; like several precursors, Galen adopted the notion of relative health. Health can range from an ideal condition to one just short of disease. This latitude leaves room *inter alia* for the different temperaments or humoral blendings characteristic of different humans in a normal healthy state and for the 40 different normal human constitutions accommodated in Galen's physiopathology. Food, drinks, exercise, rest, bathing, massage, the surrounding air, sleeping, being awake, excretions, and emotions are interactive factors that can be regulated quantitatively and qualitatively by "hygiene" to preserve health in different human types and under different conditions.

3. *Health and human values.* While there was a broad consensus in most epochs that health should be classified among the goods (*agatha*) or among the excellences or "virtues" (*aretai*) of the body, there was less agreement about its value relative to other goods. In popular morality health often is given first place. A drinking song, for example, ranked health first, beauty second, and wealth third (Plato, *Gorgias*, 451e1–452d4). Isocrates' hierarchy was health first, then prosperity, then being honoured as a morally good person; and the comedian Philemon (*c.*368–267 BC) ranked health first, prosperity second, pleasure third, and owing no debts fourth. Among the maxims attributed to Menander is also the transculturally recurring claim that "nothing is better in life than health". It is hardly surprising that Hippocratics agree that health is worth the most to human beings (e.g. *Regimen in Health* [in *Nature of a Human Being*]).

A related but logically different valorization of health is the depiction of health as a necessary condition of all other human goods. In a paean to the goddess Hygieia (Health), Ariphon of Sicyon (5th–4th century BC), for example, sang "without you no one is happy", claiming that Health alone makes possible the joys of wealth, children, political power, and eros. This commonplace is found in a variety of genres, including medical treatises. The Hellenistic physician Herophilus, for example, depicted the actualization of all human goods – those of the soul, of the body, and external ones – as dependent upon health.

Not all Greeks agreed, however, that health should be accorded first place among the goods. Philosophers, in particular, challenged this popular view. Crantor (*c.*340–275 BC) envisioned a Panhellenic theatre in which personifications of four traditional goods vied for first prize in an oratorical contest. The audience awarded first prize to Courage, second to Health, third to Pleasure, and fourth to Wealth. And in Plato's *Republic* (9) Socrates argues that a wise person will not make physical health a chief aim but will rather subordinate the interests of the body to those of the soul; harmony in the body should merely be in the service of harmony in the soul. Similarly, in Plato's *Laws* (1. 631b6–d6) the Athenian stranger ranks four "divine" goods – wisdom, moderation, justice, courage – above four "lesser human" goods, viz. health, physical beauty, physical strength, and prudent wealth. Aristotle, too, proposed a hierarchical distinction between goods or virtues of the soul (which in turn are subdivided into intellectual and moral virtues), goods of the body (health here being valued more highly than strength and beauty), and external goods. The Stoics went further, arguing that health, though preferable, is neither a virtue nor a vice but morally indifferent (*adiaphoron*).

4. *Health and religion.* The remarkable popularity of the cult of Asclepius in all parts of the Greek world did not eclipse the many other divinities associated with health. *Hygieia* ("Health"), for example, appears as an epithet of Athena as early as 500 BC and, slightly later, as the personification of an attribute of Aphrodite, as a divine daughter of Asclepius, and as an independent goddess. Sometimes Health also shared cult sites with Dionysus, Tyche, and other deities. The Greeks' relation to Hygieia and to other gods of health expressed itself in sacrifices and prayers that signalled an expectation not only of health but also of the enjoyment of other physical, mental, and material "goods" (including especially eros and "blameless wealth"). Criticism of the use of religious practices to achieve health was occasionally voiced by philosophers (e.g. Democritus and Diogenes of Sinope), and magicians and charlatans were explicitly denounced by Hippocratics. But many representatives of scientific medicine, including several Hippocratics and Galen, explicitly accepted the therapeutic

role of religion, notably of Asclepius and of prayer, much as some Byzantine writers transmitted scientific theories of health, even while worshipping Christ as Healer and while accepting a Christian body–soul dualism that devalued physical health and privileged Christ as physician of the soul. About paganism in the Roman empire it has been remarked that "the chief business of religion...was to make the sick well" (MacMullen, 1981). Early and Byzantine Christianity likewise recognized the pervasive longing for mental and physical well-being and, by addressing this desire both theologically and practically (e.g. through care of the infirm and "hospitals"), it rendered Christ a victorious successor to Asclepius, even as Byzantine Christians transmitted Galen's science of health.

Hecataeus of Miletus

Prose writer of the 6th–5th centuries BC

Hecataeus of Miletus, son of Hegesander, the most important of the early Ionian prose writers, was active in the late 6th and early 5th centuries BC. The little that is known of his life is drawn from Herodotus, in whom may repeatedly be detected a tension between unacknowledged exploitation of and polemic against Hecataeus' work. Herodotus introduces Hecataeus in conversation with the priests of Amnon at Thebes (2. 143), an encounter which strongly suggests a symbolic force as the representative of the Ionian enlightenment confronts the custodians of Egypt's ancient wisdom. Hecataeus reappears in a very different context, playing a prominent part in Herodotus' account (5. 36, 124–26) of the planning of the Ionian Revolt (500–494 BC). His prudent opposition, based on geopolitical considerations, suggests a relatively senior figure; he does not forfeit the confidence of the leaders of the liberation movement by his disapproval of their strategy, and his clear-sighted estimate of their chances demonstrates the value of geographical study for those who want to serve their fellow citizens. There is reason to doubt the historicity of Hecataeus' role in both these episodes; the prominence which Herodotus here affords Hecataeus should perhaps be seen primarily as a tribute to one whom he recognized as his intellectual precursor.

Besides improving Anaximander's map of the world, which he envisaged as a flat disc encircled by the river Oceanus, Hecataeus wrote a pioneering work of systematic geography, the *Periegesis* or *Periodos Ges* ("Journey Round the World"), divided into two books, "Europe" and "Asia" (the latter including Africa). The *Periegesis* provides information about the places and peoples to be encountered on a clockwise coastal voyage round the Mediterranean and the Black Sea, starting at the Straits of Gibraltar and ending on the Atlantic coast of Morocco, with diversions to the islands of the Mediterranean and inland to Scythia, Persia, India, Egypt, and Nubia. In addition to the enumeration of peoples and their territorial boundaries, of rivers, mountains, bays, towns and harbours, Hecataeus on occasion notes other items of interest, such as strange customs (e.g. frr. 154, 284, 287) and legendary history (e.g. frr. 76, 129); but if his geographical work could be adequately accommodated in two rolls without further subdivision, he cannot often have gone into much detail. We owe to Hecataeus the familiar description of Egypt as the gift of the Nile (fr. 301; cf. Herodotus, 2. 5. 1, Arrian, *Anabasis*, 5. 6. 5). It is uncertain how far his information was based on his own first-hand observations and inquiries; Miletus, with its extensive colonial network and overseas trade, would have been an ideal environment in which to gather geographical data. We might wonder, too, whether he was indebted to topographical and ethnographical information assembled by the Persian administration. It is difficult to assess how much Herodotus owed to Hecataeus' work, and, though much subsequent

geographical writing probably drew on it, precise debts are hard to identify. Over 300 fragments of the *Periegesis* survive, the two parts of the work being about equally represented; but many are merely citations in Stephanus of Byzantium recording the occurrence of a place name in the *Periegesis*. Callimachus regarded as spurious the text of *Asia* known to him (T 15: Athenaeus 70A, 410E; Arrian, *Anabasis*, 5. 6. 5), presumably the source of citations in later authors; we do not know his reasons, but it is likely enough that a topographical work would be tacitly brought up to date so long as it was felt to have some practical utility, and he may have been troubled by references to places beyond the horizons of a writer active around 500 BC.

We do not know whether Hecataeus' geographical work preceded or followed his mythographic treatise, the *Genealogies* (or *Histories* or *Herologia*). This comprised at least four books, but fewer than 40 fragments survive (and some of those conventionally assigned to the *Genealogies* by reason of their subject matter may belong to foundation legends related in the *Periegesis*). The opening of the *Genealogies* proclaims Hecataeus' intellectual independence, and rather suggests that he was influenced by contact with foreign traditions (fr. 1): "Hecataeus of Miletus speaks thus. I write what seems to me to be true; for the Greeks have many tales which, as it appears to me, are absurd." His subject was the legends of families claiming a divine origin (including, apparently, his own (Herodotus, 2. 143)). It is not clear whether his terminus was the Trojan War, or whether he continued to include material relating to the sons of the Homeric heroes; but it should certainly not be supposed that he regularly attempted to follow genealogical traditions down to his own day. In the *Genealogies* legends of the heroic age are transposed into the sober rationalism appropriate to prose; the methods of Ionian science are applied to the legendary past. As is shown by his treatment of Geryon (fr. 26), who is relocated from the far west to Ambracia, and of Cerberus (fr. 27), identified as a formidable snake, called the hound of Hades because of its lethally poisonous bite, Hecataeus evidently believed that behind the fabulous elaborations of tradition lay historical facts distorted by exaggeration or by literal interpretation of metaphorical expressions. Whether he pioneered this demythologizing approach we cannot tell, but certainly it proved immensely influential; Herodotus' treatment of the foundation of Dodona (2. 54–57) well illustrates its application, and Rudolf Bultmann's work on the New Testament demonstrated that still in the mid-20th century the method retained its attraction not only for journalists but even for serious scholars.

Dissimilar as the subject matter of his works may at first sight appear, both alike serve as intermediaries between Archaic catalogue poetry and the more sophisticated methods of synthesizing information about the *oikoumene* characteristic of the 5th century BC. Here, as with many of the developments associated with Ionian intellectuals, we see the beginning of trends often regarded as characteristic of the sophistic movement. The fragments are too short to give a fair idea of his style; ancient critics regarded it as clear but much less varied and attractive than that of Herodotus.

Heraclitus of Ephesus, the approximate contemporary of Hecataeus, took a severe view of his work, including him with Hesiod, Pythagoras, and Xenophanes in his list of those who showed that much learning did not produce good sense (12B40 Diehls-Krantz).

STEPHANIE WEST

Biography

A native of Miletus, active in the late 6th and early 5th centuries BC, Hecataeus was the most important of the Ionian prose-writers and Herodotus' most significant intellectual precursor. Besides revising Anaximander's map, he wrote a geographical work (*Periegesis*) and a rationalizing mythographic treatise (*Genealogies*), of which only fragments survive.

Helena, St *c.*AD 255–*c.*330

Mother of the emperor Constantine I

Helena was born of humble stock in Drepanon, Bithynia, probably in the 250s. She was an innkeeper when she met Constantius Chlorus, whose wife (or concubine) she became, and to whom she bore the future Constantine I. When Constantius, as a junior member of the Tetrarchy – Caesar to the Augustus Maximian – married Maximian's stepdaughter, Theodora, Helena was excluded from court, and she did not return there until after Constantius' death. As the mother of the emperor Constantine, Helena's influence rivalled that of Constantine's wife, Fausta. Under her son's influence she embraced Christianity (earlier she may have been Jewish). She became Augusta, together with Fausta, around 325, and may have had a hand in the murder of Fausta, after the execution of her favourite, her grandson Crispus, in 326. In that year she embarked on a pilgrimage to the Holy Land, where she discovered several sacred sites, and founded and richly endowed the churches at Bethlehem and on the Mount of Olives in Jerusalem. According to a later legend, it was during this pilgrimage that Helena discovered the True Cross, portions of which were to be found throughout the Mediterranean world, venerated as relics, by the end of the 4th century. Eusebius, in his account of the pilgrimage in his *Life of Constantine*, composed in the late 330s, knew nothing of the discovery of the cross, but in 347 Cyril, bishop of Jerusalem, makes

mention of the "holy wood of the cross". He, however, appears to have known nothing of any connection with Helena. The last of the Church Fathers to be ignorant of the legend of Helena's discovery of the True Cross appears to be John Chrysostom, and the first account of the legend occurs in the panegyric preached by Ambrose, bishop of Milan, at the death of the emperor Theodosius in 395. After her return from the Holy Land, Helena lived, not at her son's court in Constantinople, but in Rome.

Helena's influence is manifest in two ways: in connection with her legendary discovery of the True Cross, and in connection with her son, Constantine. Legends grew up around her discovery of the cross. Already by the time of Ambrose, the legend tells how three crosses and two nails were discovered by Helena. Barely a decade later, around 403, we find more developed accounts in which the True Cross is identified by its miraculous powers, healing a sick lady according to Rufinus in the continuation appended to his translation of Eusebius' *Church History*, and raising from the dead the body of a man, recently deceased, the final form of the legend, according to Paulinus of Nola (*Epistles*, 31). These legends, further amplified into a story that stretched from Adam, by way of Solomon and Constantine, to Herakleios, who recovered the True Cross from the Persians in 629, perhaps had greater currency in the West than in Byzantium, where the feast of the Exaltation of the Cross, celebrated on 14 September, has as much to do with the cross as a symbol of the divine protection of the Christian empire as with the legend of the True Cross itself.

It is in connection with her son, Constantine, that Helena is honoured as a saint; the pair are described as "sovereigns equal to the apostles" (*isapostoloi basileis*) in the *Synaxarion* (short notices on saints to be included in the daily office) for 21 May, the date of their commemoration. As early as the 5th century, the imperial couple Marcian and Pulcheria were hailed as the new Constantine and the new Helena at the Council of Chalcedon in 451; another pair similarly honoured were Constantine VI and his mother and co-regent Irene, at the end of the 8th century. Constantine and Helena are mentioned, somewhat incongruously perhaps, in the marriage service of the Byzantine Church, when their prayers are invoked in the prayer of blessing of the newly married couple.

ANDREW LOUTH

Biography

Born *c.*AD 255 at Drepanon in Bithynia to humble, possibly Jewish, parents, Helena became the wife or mistress of Constantius Chlorus and by him the mother of the future emperor Constantine I. She received the title Augusta *c.*325. In legend she is celebrated for finding the True Cross in Jerusalem. As a saint she is revered in association with her son. She died in Rome in the 330s.

Heliodorus

Novelist of the 4th century AD

Author of the *Aithiopika* (Ethiopian Story), the last and most sophisticated of the ancient Greek novels, Heliodorus stands at the crossroads of Hellenism. Probably written shortly after AD 350, in the twilight of paganism, the novel itself looks resolutely backwards to Classical Greece, apparently ignoring the existence of both Rome and Christianity. By its scale – ten books – technical flamboyance, and appropriation of the canonical texts of Classical Greek literature, it seems almost deliberately set up as the final authentic masterpiece to round off the Classical tradition. The fact that it was arguably exploited by Julian the Apostate in two of his orations seems to confirm that it shares the emperor's militant nostalgia for the pagan past. And yet, according to our earliest biographical testimony, that of the 5th-century ecclesiastical historian Socrates, Heliodorus went on to become a Christian bishop who enforced strict celibacy on his clergy at Trikka in Thessaly. Whatever the truth of this report, it was instrumental in ensuring the novel's survival in Byzantium and thence its transmission to the Renaissance in western Europe, where Heliodorus was ranked alongside Homer and Virgil as a master of epic narrative. Though it is not quite what modern readers expect a novel to be, it is, within its own terms, a masterpiece. Recent work has explored Heliodorus' innovative narrative technique, which shows rather than tells and conscripts the reader into an active interpretive role, from the enigmatic opening tableau onwards.

Heliodorus locates his novel firmly in the Classical mainstream. Although its plot follows the romantic stereotype of a beautiful young and noble couple (Theagenes and Charicleia) falling in love at first sight and enduring numerous adventures, ordeals, and attempts on their chastity before living happily ever after, the *Ethiopian Story* is both more intricate and less episodic than its predecessors. It presents its familiar story in a radically new way, by beginning in the middle and then filling in the earlier episodes by means of a long retrospective narration by one of the characters, which ends about halfway through the whole. This format is clearly modelled on the *Odyssey*, and indeed Heliodorus has also modified the standard story so that, for one of its protagonists at least, it becomes, like the *Odyssey*, a journey home, culminating in marriage and paternal recognition. Specific episodes, such as a necromancy, also recall the Homeric prototype, while the secondary narrator, an Egyptian priest called Calasiris, begins with a quotation from the *Odyssey* and is a figure of Odyssean cunning and duplicity – characteristics that inform his narrative technique as well as his actions. The novel is also permeated by references and allusions to the Athenian theatre (often in abstruse technical detail), partly as a meta-literary commentary on its own theatricality, partly as a device of characterization to distinguish between the "tragic" protagonists and "comic" secondary characters. Some episodes recall specific tragic models; for example, the subplot of his stepmother's infatuation with the Athenian Cnemon, which he narrates in the first book, rewrites the story of Hippolytus, and the events of the final book, when the protagonists face human sacrifice at the end of the earth and a king proposes to sacrifice his own

daughter for the sake of his community, play on the reader's acquaintance with Euripides' two Iphigeneia plays. For the setting, Heliodorus has ransacked Classical historians and geographers: every detail of his Ethiopia, for example, can be traced to literary sources, occasionally in defiance of known reality.

The heroine of the novel, Charicleia, is an Ethiopian princess, born white to black parents, exposed at birth, and subsequently brought up as a Greek by the priest of Apollo at Delphi. The hero, Theagenes, is a descendant of Achilles and characterized as a true Hellene by his victory at the Pythian games. The couple's adventures lead them through Egypt and an encounter with the corrupt and sensual Persian occupying powers – the story is set in the 6th century BC – to Ethiopia, where the novel ends with their installation as priest and priestess of the Sun and Moon, the Ethiopian national gods. It is difficult not to read this scenario as a coded exploration of the nature of Greek cultural or racial identity and its place in the multicultural world of the Roman empire, especially as Heliodorus, at the end of the novel, reveals himself as non-Greek, a Phoenician from Emesa. Similarly the novel's polemically pagan religious apparatus of divine governance and its basically, but unsystematically, Neoplatonic world view – with an almost abstract pure divinity mediated to humanity by a plurality of lower and often malevolent powers – combined with an untypically ascetic sexual ethic applying equally to male and female, look like a displaced engagement with the issues posed by the rise of Christianity.

If we discount an uncorroborated report by the 14th-century historian Nikephoros Kallistos Xanthopoulos, that the bishop Heliodorus had to renounce his see because he refused to disown his novel, we have no evidence for the reception of the *Ethiopian Story* before the Byzantine period. As early as the 7th century a few of Heliodorus' *sententiae* were included in the *Florilegium* of Maximos the Confessor, and from this and similar anthologies passed into Byzantine paroemiographies. His novel was read and summarized by Photios in the 9th century, discussed from a literary and moral perspective by Psellos in the 11th, and subjected to an allegorizing Christian interpretation by Philippos Philagathos in the 12th. In the same century the basic plot structure of the *Ethiopian Story*, with its beginning *in medias res*, was imitated in the literary Byzantine romances of Theodore Prodromos and Niketas Evgenianos, who also took over details of theme and incident. The *Ethiopian Story* was hugely influential in western Europe after the publication of the *editio princeps* in 1534 and Amyot's French translation in 1547, but much less so in Greece. However, in 1804 Adamantios Korais published a groundbreaking edition with modern Greek commentary, in the introduction to which he claimed the modern novel as a Greek invention.

Biography

Born at Emesa in Syria and probably writing in the 4th century AD, Heliodorus was the author of the *Ethiopian Story*, last of the surviving ancient Greek novels. According to the 5th-century historian Socrates, he later became a Christian bishop. This has been doubted, but the story no doubt ensured the survival of the text.

Hellenes

Ethnonym for ancient and modern Greeks

Although the Greek language was already employed by the time of the Linear B tablets of the 13th century BC, the term "Hellenes" is so far unattested for the Mycenaean period. Thucydides (1. 3) notes that in the Homeric poems the Greeks who participate in the expedition to Troy are denoted variously as Argives, Achaeans, and Danaans rather than described collectively as Hellenes – a term which is only applied to the Phthian contingent led by Achilles; on these grounds the historian hypothesizes that the name originally denoted a small tribe in Phthia (southeast Thessaly) before being disseminated more widely to describe all the populations of Greece. Aristotle (*Meteorologica*, 1. 14. 352a), on the other hand, derives the name "Hellenes" from the Selloi who were thought to have lived in the Epirote region of Dodona in northwest Greece, while a fragment of a 6th-century poem, erroneously ascribed in antiquity to Hesiod, describes Dodona as lying within the country of Hellopia.

A strictly empirical analysis of the occurrence of the terms "Hellas" and "Hellenes" in the extant literature of the Archaic period has prompted many scholars to accept the Thucydidean interpretation regarding the diffusion of the name, though with some modifications. In the *Iliad* Hellas is envisioned as adjacent though not identical to Phthia (2. 683; 9. 478) while the Panhellenes seem to have included the Locrians to the immediate south of Phthia (2. 530). The term "Hellenes" is not attested in the *Odyssey*, but on several occasions Hellas is opposed to Argos in contexts which should suggest that the former designated mainland Greece north of the Corinthian isthmus while the latter indicated the Peloponnese (1. 344; 4.

76, 816; 15. 80). Similarly, in Hesiod's *Works and Days* (early 7th century), the terms "Hellas" and "Panhellenes" appear to be limited to central and northern Greece (528, 651–53). It is sometimes assumed that the vehicle of diffusion for the name was the Delphic Amphictiony – a league of (largely) central Greek states and tribal federations charged with the administration of the Delphic sanctuary – though the early historical existence of the Amphictiony and its struggles with the Delphians are controversial.

By the mid-7th century the term "Panhellenes" appears to be applied to all the populations of the Greek mainland and islands: the Parian Archilochus (fr. 97) refers to the Panhellenic colonization of the island of Thasos in which he took part, while a pseudo-Hesiodic fragment (fr. 130) employs the term to describe the various Greek suitors who sought the hands of the daughters of Proetus. In this period it was almost certainly the sanctuary of Olympia and in particular the Olympic games that acted as the focus of Hellenic identity. Herodotus (5. 22. 1–2) describes, in the context of Alexander I of Macedon's attempts to compete in the games in the early 5th century, how the contest was restricted to Hellenes alone and that competitors' qualifications were judged by officials named the Hellanodikai (whose existence is already attested in an early 6th-century inscription). In the mid-6th century the Ionian cities of Chios, Teos, Phocaea, and Clazomenae teamed up with the Dorian cities of Rhodes, Cnidus, Halicarnassus, and Phaselis and with Aeolian Mytilene to found the Hellenion sanctuary at Naucratis (Herodotus, 2. 178. 2).

It would appear that in the Archaic period the Hellenes conceived of their common identity in ethnic terms (that is, in terms of kinship between their constituent subgroups): the 6th-century *Catalogue of Women* (frr. 9, 10a) expressed this affiliation in genealogical form by deriving the descent of Aeolus, Dorus, Ion, and Achaeus (the eponymous ancestors of the Aeolians, Dorians, Ionians, and Achaeans respectively) from the eponymous Hellen. Nevertheless, in the Persian invasion of 480 BC the Greeks of the mainland were confronted for the first time by an external enemy whose language, customs, and religion appeared so desperately alien that it instigated the rhetorical construction of a barbarian "other" in opposition to which the Greeks began to define themselves. A similar polarization seems to have occurred at the same time among the Greek colonies of south Italy and Sicily where confrontation with the Phoenicians of Carthage prompted the colonists to promote their common Hellenic identity above the Dorian, Ionian, or Achaean affiliations to which they had previously subscribed.

Typical in this regard is the definition of Greekness (*Hellenikon*) which Herodotus (8. 144.2) places in the mouth of an Athenian envoy prior to the battle of Plataea (479 BC): the Hellenes are those who share common blood, a common tongue, common sanctuaries and sacrifices, and similar customs. In the early books of his *Histories* Herodotus presents a series of ethnographic excursuses on the Persians, Egyptians, Libyans, and Scythians which serve to highlight the profound cultural differences between Greeks and barbarians and which reflect a growing conceptualization of Hellenic identity in cultural rather than ethnic terms – a definitional shift paralleled also by Sophistic and Hippocratic emphases on environmental rather than biological determinism. Both Herodotus and Thucydides imply that non-Greeks who learned the Greek language and Greek customs could "become" Hellenes and *c.*380 BC the Athenian orator Isocrates proclaimed that the Hellenes were defined by their shared culture rather than their common nature (*Panegyricus*, 50). The word that Isocrates uses for "culture" is *paideusis* (cognate with *paideia*) which denotes a cultural system imparted through education, and throughout the 4th century there is a strong sense that Hellenism is a matter of the correct education – preferably at Athens, which Pericles had already described half a century earlier as "the school of Hellas" (Thucydides, 2. 41. 1). It was this common Hellenic culture that was thought to engender a sense of *homonoia* (unanimity) – a term frequently invoked in the 4th century BC as part of a Panhellenic rhetoric which aimed at uniting the various Greek city states in a common crusade against the Persian empire, purportedly in retribution for the Persian invasions of the early 5th century.

Though contemplated by both King Agesilaus of Sparta and Philip II of Macedon, this Panhellenic crusade was ultimately undertaken by Alexander the Great whose conquests in the East planted Macedonian–Greek garrisons among indigenous populations as well as disseminating elements of Greek culture throughout much of the known world. While it is perhaps inaccurate to say that the East was "Hellenized", regular interactions and intermarriage between Greeks, Macedonians, and indigenes precluded any strict ethnic definition of the term "Hellenes" which was applied more on the basis of common cultural and behavioural traits transmitted through the traditional Greek *paideia*: so, for example, in documents from Ptolemaic and Roman Egypt Hellenes are regularly described as "those associated with the gymnasium".

The Greeks continued to call themselves Hellenes under Roman occupation despite the fact that their conquerors divided them between the provinces of Macedonia, Achaea, and Creta et Cyrene (to say nothing of the Greeks in Asia Minor and the Hellespontine areas) and referred to them as "Graeci" (itself a word of Greek derivation). A sense of a historical Hellenic identity was once again resurrected with the emperor Hadrian's foundation in AD 131/32 of the Panhellenion – a league of cities to which admission was dependent upon the ability to adduce origins from the cities of old Greece – and writers of what is known as the Second Sophistic period reinvoked an archaizing identity predicated on the Classical Hellenic past. In general, however, the term "Hellenes" retained its linguistic and cultural rather than ethnic connotations, with the Atticizing dialect considered the purest form of the Greek language.

With the spread of Christianity "Hellenes" increasingly came to designate pagans – particularly in the writings of the Church Fathers – and continuity with the Hellenic heritage was consciously ruptured through the rejection of naturalistic sculpted representations of the human form, the rectilineal architectural plan of the Hellenic temple, Hellenic philosophy (or at least some elements of it), and most importantly Hellenic religion. The equation between Hellenism and paganism was, if anything, strengthened in the 4th century AD by the apostasy and promotion of "Hellenic liturgy" on the part of the emperor Julian, and even as late as the 12th century AD the Hellenes are described as possessing a wisdom at odds with the real knowledge to be gained through the Christian religion

(Anna Komnene, 2. 34. 12). Most Greeks of the Byzantine period referred to themselves as "Romaioi" (indicating their affiliation to the Christianized eastern Roman empire), though the 12th-century historian Niketas Choniates equated "Romaioi" with "Hellenes" (496. 50) and this double nomenclature became more common during the 13th century in the face of increasing threats from Franks, Venetians, and Turks, as well as with the gradual contraction of the Byzantine empire to include mainly Greek-speaking areas.

The sack of Constantinople in 1453 and the incorporation of Greeks into the Ottoman empire stemmed appeals to a Hellenic legacy. The Greeks were assigned to the *millet-i-Rum* ("Roman Community") – a "sub-nation" constituted on the basis of the profession of Christian Orthodoxy. Both in nomenclature (*Rum* from *Romaioi*) and in the construction of an Orthodox Christian identity which Greeks shared with Albanians, Arabs, Bulgarians, Romanians, Serbs, and Vlachs, the Greeks of the Early Modern period came to regard themselves as the dispossessed inheritors of the Christian Byzantine Romaioi. Furthermore, Ottoman rule effectively insulated the Greeks from the intellectual tide of the European Renaissance in which a new interest in the Classical "Hellenic" past of Greece was rekindled (although the contribution to western interest in Classical Greece on the part of 15th-century Greek dissidents known as the "Neo-hellenes" should not be underestimated). Towards the end of the 18th century – largely as a result of the emergence of a mobile, mercantile elite – Greeks came increasingly into contact with European romantic scholars who regarded Classical Hellas as the font of Western culture; the result was the birth of a new national consciousness based on the Hellenic legacy. In 1827 Count Ioannis Kapodistria was elected the first president of Greece by the assembly at Troezen and established a 27-member assembly named the Panhellenion (after the Hadrianic organization), while in 1863, a year after the deposition of Otho (the first king of independent Greece), the Danish prince Christian William Ferdinand Adolphus George assumed the title of "George, King of the Hellenes". The titular use of the ethnic (Hellenes) rather than a territorial designation (Hellas) reflected the central aspiration of the Great Idea (*megali idea*) which sought to unite all the Hellenes of the former Byzantine empire into one state centred on Constantinople, but after the Asia Minor catastrophe of 1922 and the subsequent exchanges of population between Greece and Turkey, the term "Hellenes" has generally been used to designate the nationals of the modern state of Greece (Ellas).

Summary

According to Herodotus, Hellenes shared common blood, a common language, common sanctuaries and sacrifices, and similar customs. For Isocrates they were defined by their shared culture (*paideusis*) rather than common nature. In the Roman period Greeks still called themselves Hellenes, but Christianity equated Hellenes with pagans, and Byzantine Greeks called themselves Romans. Not until 1863 did a Greek monarch describe himself as "King of the Hellenes".

Hellenism and Neohellenism in the Greek tradition

The terms "Hellenism" and "Neohellenism" are first and foremost used to designate specific periods of history. By this definition, "Hellenism" is the designator for the pre-Christian civilization and culture of the Hellenes; "Neohellenism" that for the civilization and culture of the Hellenes of the Early Modern and Modern periods. Such definitions, however, both beg the question and are extremely insubstantial. For what, then, are the "Hellenes"? Are they defined by a shared language, a shared culture, a shared religion, or a shared geographic territory? Which of these unifying factors is to be considered dominant is a topic that has long been debated by historians, by non-Greek observers, and by the so-called Hellenes themselves. Clearly, there are Greeks to be found far beyond the geographic confines of the modern Greek state; there are Greeks who do not speak Greek; there are Greeks who are not Orthodox Christians. Conversely, there are Greek-speakers who do not consider themselves Hellenes, just as there are official citizens of Greece who define themselves as members of other nations. Thus it is that a central component of both Hellenism and Neohellenism has been the attempt to define the parameters of the "Hellenic" people.

In addition to the controversy and debate surrounding even these most basic definitions of "Hellenism" and "Neohellenism", there is the confusion arising from the fact that these terms refer also to intellectual movements, schools of historical interpretation, and genres of political rhetoric. Finally, the connection between the two terms is similarly controversial. The clear etymological implication is that "Neohellenism" is simply that – that is, "new" Hellenism. But

whether or not the chronological connection between Hellenism and its modern counterpart is best understood as one of continuity or one of the resurrection, rediscovery, and recreation in the Early Modern and Modern periods of an ancient cultural artefact is hotly debated. And again, this debate is one that concerns not just academics but the Greeks themselves.

Let us first begin with an examination of the most basic definition of the "Hellenic" and "Neohellenic" periods. Roughly speaking, "Hellenism" relates to the pre-Byzantine Greek past, particularly the Classical period, while "Neohellenism" refers to the post-Byzantine period of revived interest in the Hellenic Classical heritage. The Byzantine period, then, is thus regarded in some peculiar way as marking a rupture or discontinuity in the Hellenic tradition. The reasons for this are complex and numerous, but one stands out most clearly: Christianity, whose alliance and blending with Hellenic cultural traditions is the very hallmark of the Byzantine period, was explicit in its rejection of many of the central defining features of Classical Hellenism. First and foremost, Byzantine Christianity regarded Hellenism as a tradition of paganism, barbarism, and heresy. Byzantine Christianity, in short, regarded itself as everything that Hellenism was not. Hellenism was polytheistic; Christianity was the purest form of monotheism. Hellenism condoned and fostered barbaric social customs while Christianity was their enemy. And Hellenism was based on fundamentally heretical philosophical premises, while Christianity understood itself to be the only legitimate philosophical system.

Christianity's hostility towards Hellenism was, during the Byzantine period, explicit and intense. Many of the most famous political, ideological, and religious debates of the Byzantine period found their origins in the conflicting world views of Hellenism and Byzantinism. Church attacks on so-called heresy were in most instances attempts on the part of the Church to do away with the cultural and intellectual remnants of the Classical period.

The official Byzantine hostility to the Classical past, however, was not all-embracing. In fact, in some important regards, the Byzantine Church and political establishments fostered the preservation of the Hellenic cultural heritage. This was most markedly the case with literature of a certain genre – while the religious component of many Classical texts was found to be offensive, others (along with "sanitized" versions of mythological works) came to be regarded as the core curriculum for members of the Byzantine intelligentsia. Part and parcel of this educational curriculum was a reverence for the Classical language, knowledge of which by the 10th century was regarded as essential for advancement through the Byzantine political hierarchy.

The Classical education on which such advancement centred can, in its carefully chosen content, be regarded as a perfect example of Byzantium's ambivalent attitude towards the Classical past. On the one hand, the Classical literary record was revered for the precision, clarity, and complexity of its language, as well as for the well-developed rhetorical tradition that made up a large portion of its contents. On the other, however, the ideologies that this rhetorical and linguistic perfection were used to propagate were viewed as dangerous and heretical religious abominations. The Byzantine love of the Classics, then, should not in any way be misunderstood as being tantamount to a cultural – let alone anthropological – interest in the ancient inhabitants of the Hellenic world. The ancient Hellenes may have been the transmitters of an important linguistic legacy, but they were in all other respects regarded as impure and pagan barbarians. Not until the post-Byzantine period of Turkish rule (or Tourkokratia) did the interest in Classical Greek language and rhetoric expand to include a fascination with the peoples who had first deployed it.

"Neohellenism", then, must inevitably be understood in turn not simply as a benign resurrection of interest in the Hellenic Classical past, but also to some extent as an explicit rejection of many of the most dearly held ideals of Byzantinism. Thus "Neohellenism" is not simply a term used to designate a particular period in Hellenic history, but also indicates a certain polemical stance, an attitude of pro-Classicism, at the expense of Christian Byzantium.

Neohellenism, first, is a term used to designate the Early Modern and Modern phenomenon of revived interest – both "indigenous" and foreign – in the Hellenic Classical past, particularly in contradistinction to the relative Byzantine hostility towards the Classical period. Just when this revived interest began is difficult to pinpoint with any degree of accuracy. Indeed, there are those who would argue that it is misguided to speak of Neohellenism as marking a period of "revived" interest, claiming instead that there has been a continuity of interest in the Classical period throughout all periods of Hellenic history, and thus that the Byzantine period does not in fact mark a point of rupture. While there is some validity in this stance, it is important to note that at the very least the interest in the Classical period characteristic of Byzantinism was a very specific and qualified interest; Neohellenism is best understood as a period of more unqualified and positive regard for Classical Greece. In this latter regard we can safely say that the Neohellenism of the late Turkish period marks a distinctive intellectual trend, a marked departure from the dominant cultural attitudes towards the Classical period that were regnant until the 17th and 18th centuries.

Some historians date the earliest rise of Neohellenism to the final centuries of Byzantium, although the Byzantine interest in the Classical past is perhaps best grouped instead under the designator "Hellenism", so as to distinguish it from Neohellenism, which in its most distinct form is properly dated to the 18th century. The rise of Byzantine Hellenism is attributable to a number of political and cultural factors. The most dominant feature of this period was the unavoidable fact of Byzantine decline – by the early 15th century the city of Constantinople stood isolated, an island of Byzantinism in a vast sea of Ottoman territory. Under such circumstances, visions of Greek geographical, religious, and political dominance were difficult to maintain. In their stead, many scholars began instead to focus on a notion of cultural dominance, a form of dominance linked to linguistic, intellectual, and historical superiority. Quite understandably, faced with a bleak historical present, intellectuals came increasingly to focus on an idealized vision of the Greek past, and gave greater attention to memories not just of Byzantine splendour, but to the cultural forms that had preceded Byzantium.

The dominant thinker in this new attitude towards the past was George Gemistos Plethon, who on the eve of the fall of

Constantinople to the Turks in 1453 argued for the foundation of a new "Hellenic" state, to be situated on the Peloponnesian peninsula and guided by a secularized set of Neoplatonic philosophical principles. This proposal was remarkable on a number of counts. Plethon's suggestion was at heart an anti-ecclesiastical one, proposing as it did that the traditional backbone of society – the Byzantine Church – lacked the philosophical sophistication effectively to shape and rule the polity. Moreover, Plethon's argument that the Peloponnese, rather than the Christian city of Constantinople, should make up the core of the new state, was further indication of his belief that the intellectual and political scope of the Classical period far outstripped that of Byzantium. Just as, symbolically speaking, Constantinople was inextricably linked to Greekness in its Christian form, so too was the Morea (the Peloponnese) connotative of the Hellenic Classical past. Finally, and of greatest symbolic importance, was the fact that Plethon, in his discussion of the new state, was the first to make proud use of the collective designator, "Hellenes", to describe the cultural group of which he considered himself a member.

Hitherto, this term had been regarded as an insult, a designator best eschewed because of its implications of ignorance, barbarism, and heresy. For Plethon (and his fellow *Hellenizontes*) to use it instead as the proud signifier for a group of people whom he regarded as unified not by the Christian tradition but rather by culture, language, and history, was a radical departure from the dominant rhetoric of Byzantium.

Plethon's call for the resurrection of a distinctively "Hellenic" nation was both radical and short-lived. For with the final, official death of Byzantium in 1453, this new intellectual fascination with the pre-Byzantine Classical past was dealt a major blow. Not until some four centuries had passed would Greeks again use such explicitly pro-Classicist rhetoric to frame their self-understanding. It is with this later revival of interest in the Greek people's Classical origins that the term "Neohellenism" is now most commonly associated. It is important to note, however, that it had important predecessors as early as the 15th century.

Just as Plethon's early version of Neohellenism (that is, Hellenism as an intellectual movement) was at heart a response to a state of political and cultural crisis, so too were later 18th- and 19th-century Neohellenist movements. In the case of these latter, however, the impetus was not Byzantine degeneration, but rather the perceived decline of the Ottoman state, which by the close of the 16th century had already passed the zenith of its political, cultural, and economic development.

By the 18th century the imminent demise of the Ottoman empire was widely regarded as an inevitability; the only uncertainly was when the Ottomans might meet their final end. In the face of the impending possibility of liberation from Ottoman rule, Greek intellectuals and revolutionaries became increasingly interested in the question of what form a newly liberated Greek nation might take. The two dominant paradigms were both drawn from the past: some argued that Byzantium should provide the model for modern-day Greek political reconstruction, while others felt that the Greeks should reach still further back into the past, and use a reinterpreted version of the forms and ideals of Periclean Athens as the basis for a new Greek state.

The former was the dominant position within Greece itself, and found strong representation among the general populace, whose experience of "Greekness" during Tourkokratia had been most strongly mediated and propagated by the Greek Orthodox Church. For such Greeks, Orthodoxy and Greekness were inextricably linked: their "national" holidays were one and the same with religious ones; almost without exception, Greeks took their names from those of Orthodox saints; even such distinctive cultural forms as cuisine traced much of their origins to the religious establishment. The latter position, however – that the Greeks should look to the Classical, rather than Byzantine, past in their efforts at national regeneration – came to play the more decisive role in the actual process of Greek liberation from Ottoman rule.

The relationship between this attitude towards the Classical past and the emergence of the modern Greek state was forged in the context of a movement that has been termed the "Neohellenic Enlightenment". This movement, dominant during the Greek revolutionary period (dating roughly from the early 1770s to the mid-1830s), is best understood as a syncretism of, on the one hand, Greek revolutionary aspirations generated from within the territories of the Ottoman empire, and, on the other, the ideals of the western secular intellectual elite. (It is important to note, however, that there was from the start significant overlap between these two categories, for wealthy Ottoman Greeks had for centuries travelled to the universities of Europe to pursue their education, and by the time of the Greek War of Independence there were significant mercantile and intellectual Greek diaspora communities throughout Europe.)

The western intellectual establishment's infatuation with Classical Greece dated at least from the time of the Renaissance, and had by the late 18th century become so widespread that many European intellectuals felt that it was their moral obligation to assist the Greeks in their bid for independence from the Ottomans. At stake, such intellectuals believed, was nothing less than the liberation of the very foundations of Europe's own intellectual, cultural, and political traditions. Thus a heavily political component was injected into the Greek intellectual environment: Greek interest in the Classical past would win a greater chance of European philhellenic support than would an emphasis on the Byzantine past. In the context of plans for armed insurrection – an insurrection that could only hope to succeed with European intervention – the debate between the pro-Classicists and the pro-Byzantinists was no longer merely an academic matter. Political concerns came increasingly to affect the terms and tenor of the debate.

The Neohellenic Enlightement, with its emphasis on the Classical Greek heritage, had as one of its articles of faith that there was a clear genetic and cultural continuity between the modern Greeks and the Hellenes of the Classical period. By this view, the Turkish and Byzantine periods were to some extent responsible for the "contamination" of the Hellenic race, such that many Hellenes were no longer able to recognize themselves as such. Such revolutionary tracts as the *Hellenike Nomarchia* were explicit in their criticism of the Orthodox Church, an institution that many Greeks regarded as the preserver of Greek cultural identity during Tourkokratia. The Neohellenic programme thus had as one of its central components to "teach" Greeks of their true, Classical origins, and to

instil in them a sense of unity, a group identity based on the belief in a cultural continuity stretching back thousands of years. Those familiar with the broad contours of the world-wide nationalist movements of the 18th, 19th, and 20th centuries will recognize that such educative ventures stand at the heart of virtually all of them.

The tension between the pro-Classicist and pro-Byzantinist camps was not resolved with the successful conclusion of the Greek War of Independence. Indeed, there remains to this day in Greece a hybrid nationalist self-definitional stance, one that simultaneously embraces the Byzantine and Classical periods as the twin bases for modern Greek society. While this cohabitation is for the most part harmonious, there has nevertheless been ongoing jockeying to rectify the often paradoxical implications of this bipartite stance. One clear example of this tension can be seen in the language debates of the 19th and 20th centuries, when intellectuals, politicians, and Church representatives argued over whether the pro-Classicist katharevousa or the common demotic form of Greek was to be the official language of the new Greek state. The most prominent politicians and intellectuals of the modern period (Vernardakes, Palamas, Dragoumis, Venizelos – to name but a few) have all grappled with the question of the Greek past and its proper role in the formulation of the modern nation-state.

Because of the myriad connotations of the terminology involved, this discussion of Hellenism and Neohellenism in the Greek tradition is perhaps best concluded on a theoretical note. Clearly, both Hellenism and Neohellenism, as intellectual movements that bore obvious political and otherwise polemical implications, were concerned not simply with "rediscovering" the past, but in "recreating" it, in re-visioning it. That is to say, the "past" was not simply a distant and dead artefact, but something to be constructed and created in the present. The central issue here was not "authenticity" (as if such a thing could ever be successfully arrived at), but rather "usefulness", or social functionality. Students of both the Hellenic and Neohellenic revivals must be aware that the imagined past with which pro-Classicists were concerned was informed as much by their own contemporary circumstances as by the actual "facts" of the Classical past. Even in Plethon's time, the Periclean age of Athens was a good long way in the past, and even the abundant Classical texts still available in the 15th century could provide only the basis for the roughest similacrum of the Classical era.

Hellenism and Neohellenism were intellectual and social movements inspired not just by the past, but by present circumstances as well. They sought to respond to present needs – in the case of the former, the decline of Byzantium; in that of the latter, the formation of the modern Greek state. The richness and subtlety of these movements are based precisely on this fascinating interaction between past and present, and they are rightly understood in this palimpsestic light, which uses thousands of years of Hellenic history as a lens through which to interpret a changing present.

Hellenism as viewed by visiting artists

Travellers to Greece have in many different regards played a central role in the development and propagation of notions of Hellenism, both within Greece and, especially, in the western European cultural imagination. Many of these travellers have traditionally been artists of various sorts – poets, novelists, painters, and musicians alike have found inspiration in Greece. Even those artists who did not themselves visit the Greek lands used them freely as the backdrop for their work. Underlying this artistic fascination with Greece was a complex set of intellectual and ideological assumptions.

This symbiosis between western artistry and Greece is predicated on what some scholars have termed the "Hellenic Ideal" – that is, as David Constantine (1984) has put it (p. 6), "the admiration of, the longing for those values which the eighteenth century sited in Ancient Greece". Western European travellers have for more than half a millennium been drawn to Greece in the belief that it was a sort of living museum, in which visitors could see nothing less than the living artefacts of Classical Hellenism. It is important, then, to note that travel to Greece was not merely a matter of geography, but also of chronology. Those Europeans who visited Greece were not merely moving eastward through space, but they also felt as if they were in some way moving backward in time. The students who viewed a visit to Greece as an essential part of their educational curriculum were not primarily interested in modern Greece, or even in its Byzantine predecessor. Rather, they regarded travel to Greece as a sort of anachronistic interactive exhibit in which they could find nothing less than the ongoing vestiges of Periclean speech, religion, and philosophy. Thus the so-called Hellenic ideal was intimately connected to Neohellenism's claim of Hellenic continuity, the belief that

there was a direct racial and cultural link between the modern Hellenes and their Classical predecessors. So it is that, while artists did not in number start to visit the Greek lands until well after the Renaissance, they almost all focused in their work not on the contemporary Greek physical and cultural landscape, but rather on the image of Classical Greece. Painters depicted noble, decaying columns and broken statues; poets and novelists alluded to the heroes of Classical mythological tradition; and travel writers patterned their itineraries on the travels of Odysseus, Theseus, and other epic protagonists.

The French and particularly British fascination with Hellenic culture had a long and revered history. This specific, cultural interest in Greece was intimately linked to the Renaissance belief that the Classical civilizations of Rome and, later, Greece in some way provided the foundations – political, aesthetic, and philosophical – of western Europe itself. Indeed, this belief ultimately became so entrenched an ideology in Europe that by the end of the 17th century large numbers of travellers journeyed to Greece for no other reason than the educative benefits that such a trip was thought to offer.

Whereas initially the standard educational trip had Italy as its easternmost destination, by the close of the 18th century Greece came to supplant Italy as the most popular destination of the gentleman traveller. This increased interest in the Classical civilization of Greece was linked both to political concerns (the Napoleonic Wars of 1792–1815, for instance, made travel in France and Italy an impossibility) and to the developing sense that Italian culture was a mere shadow image, a cheap imitation, of the real thing – Greece. As Gustave Flaubert wrote after his first visit to Greece: "The Parthenon spoiled Roman art for me: it seems lumpish and trivial in comparison. Greece is so beautiful."

This belief that travel to Greece had a large educative component both fostered, and was fostered by, philhellenism. On the one hand, the belief in the edifying power of travel propelled students eastward in the quest to see the lands that had given rise to many of their central "canonical texts". On the other hand, travel itself was understood to be a central feature of the lives of the ancient Hellenes whom these scholars studied. Classical tradition glorified travel, and the Hellenes themselves had preserved in their literary record the stories of mythic travellers and the importance of travel for their maturation and education. As Olga Augustinos, a leading scholar of philhellenism and the history of European travel in Greece, writes (p. 57): "[The Philhellene travellers'] greatest heroes, Theseus and Jason among others, as well as their most original thinkers, used the voyage to accomplish their tasks." In undertaking travel to Greece, western travellers were thus engaged in an imitative act. And in most instances, this imitation was both self-conscious and quite literal. Travellers attempted to retrace the steps of Odysseus, locate the mooring place of Theseus' ship on Naxos, find the labyrinth where he had slain the Minotaur. Just as the ancient Hellenes were revered as adventurers and voyagers, such that modern travellers who visited Greece understood themselves to be performing an imitative act that linked them directly to the Classical past, so too was artistic production regarded as an imitative act, an attempt to share in the artistic perfection of the ancient Greeks.

During the course of the 18th century, the visual arts became one of the most important transmitters and propagators of such notions as the Hellenic ideal and the Neohellenic belief in Hellenic continuity. Leading members of the Parisian Academy of Painting and Sculpture argued that the Greeks had, as one French artist put it, "perfect[ed] the Arts, whose object is to please by imitating nature". Thus fledgeling artists were to perfect their craft by making Classical works of art – sculptures, monuments, and architecture – the subject of their own work. Initially, travel to Greece was not considered a prerequisite for such work – artists who stayed at home could rely on the accounts and sketches of others (not to mention the growing numbers of artefacts physically removed from Greece and carried back to Europe) as the basis for their own creations. In the middle of the 18th century, however, influential artists began to go to Greece itself to find material from which to work.

Two European artists in particular found great prominence as a result of the pictures they published following their travels. These were Julien David Leroy and the comte de Choiseul-Gouffier. Leroy travelled to Athens in 1755, with the sole aim of drawing its monuments from an eyewitness perspective. The result was his *Ruins of the Most Beautiful Monuments of Greece*, published in 1758. Choiseul-Gouffier also travelled to Greece, spending a good deal of his time there drawing what he viewed as the living legacy of Classical Greece. In 1782 he published the first of the two-volume *Voyage Pittoresque de la Grèce* (Picturesque Voyage of Greece), which met with instant and immense critical acclaim, wide circulation, and translation into German. Choiseul-Gouffier's was but the most popular of a whole slew of works concerned with the artistic depiction of the Hellenic world. While many of these works, such as those of Leroy and Choiseul-Gouffier, were produced by professional artists, many other books included pictures of Greece drawn by amateurs who jotted down illustrations to accompany their journalistic travelogues.

In their obsessive interest in Greece, these artists were involved in the propagation not just of an ancient aesthetic tradition – a tradition that in their view had reached its consummate expression under the ancient Hellenes – but also in the creation of a new one. Whereas many of the Early Modern and Modern travellers who visited Greece believed that the monuments and historic sites that they saw there were nothing less than the pristine, preserved remnants of noble Hellas, the reality was of course quite different. The images produced by these travellers presented Greece as a land of eerie whiteness, lifelessness, and decay, a landscape littered with colourless statues and columns, the site of beautiful monuments and buildings, but a land apparently bereft of any contemporary vitality and life. Although Leroy, who had as one of his primary interests the interaction between the old and the new, was an exception, many artists clothed what few human figures their images included in the apparel of the Classical past and excised any other markers of modernity from their images.

The unspoken – and largely unconscious – premise on which such modes of representation rested was that the modern, contemporary Greeks, unlike their ancient forebears, were unworthy of careful consideration. The written accounts of the many Europeans who arrived on Greece's shores eager

to see the living legacy of the Classical past testify to the disappointment that these travellers felt on confronting real, living Greeks. Many chroniclers relate their horror at the degenerate appearance, boorish behaviour, and colloquial language of the Greeks they encountered while on their travels. But rather than readjust their image of Hellas and the Hellenes so as to accommodate the obvious changes wrought by thousands of years of history, many simply filtered out whatever they found disconsonant with their idealized vision of what proper Greekness was.

In large part because of such artistic interpretations of Greece, the modern Greeks have, to the present day, been both blessed and burdened by the legacy of the past. On the one hand, the past made Greece a unique destination, and granted the modern Greeks a privileged position as the direct descendants and inheritors of Classical Greek tradition. On the other hand, however, the contemporary Greeks were cursed by the fact that, to the critical European eye, they did not measure up to what was expected of the Hellenes. Indeed, to measure up to such expectations was, by definition, an impossibility, for the contemporary Greeks were being compared not to a reality, but to an imagined ideal. Many European travellers were so certain that they understood Hellenism and the Hellenes better than the Greeks themselves that they did not hesitate to criticize them for their "incorrect" speech and for what the Europeans viewed as their contaminated, ethnically diluted, physical characteristics. Many of the European artists who visited Greece during the 17th, 18th, and 19th centuries were so invested in their imagined version of the Hellenes, and in the belief that by travelling to Greece they were gaining direct, immediate access to the Classical past, that rather than acknowledge the discrepancy between their imagined version of Greece and the reality with which they were confronted they simply blocked the reality out. Thus it is that travelogues of the period are littered with references to Pausanias, Pindar, Hesiod, and Homer, with descriptions of ancient sites and artefacts, but are often relatively bereft of descriptions of the people and contemporary towns with which their authors came in contact.

"Hellenism" was thus both the quest and the construct of the numerous visiting Europeans who viewed Greece as uniquely equipped to inspire artistry. By way of conclusion, it should be noted that it is *their* version of Greece that has managed to persist in the western European cultural imagination right down to the present day. One need only look at the latest glossy travel brochures advertising "Ancient Greece" to realize that the predominant vision of Greece is, to this day, one of solitary slender marble pillars, silent statues, and dramatic, empty landscapes.

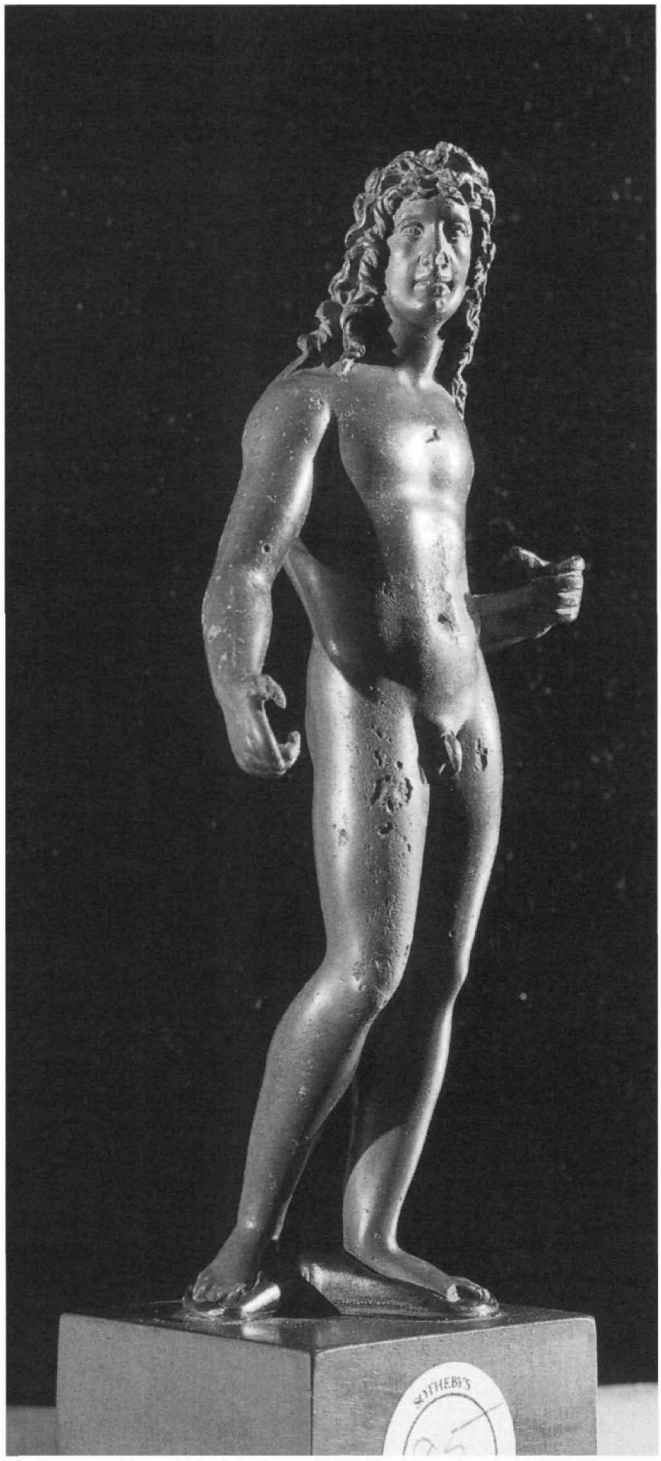
Hellenistic Period 323–31 BC

The Hellenistic age begins with Alexander the Great's conquest of the Persian empire and its incorporation into his vast, Macedonian-controlled state. It ends in more piecemeal fashion with the Roman conquest, one by one, of the various regions, now separate kingdoms, into which his empire had divided after his death, ending with the defeat of Cleopatra VII at the battle of Actium in 31 BC, and her suicide in her palace at Alexandria the following year. Its beginning is marked by a massive change in the fortunes and status of the Greek communities. The end is less marked, since in many ways the Roman empire developed out of the Hellenistic world, and in its system of administration was much influenced by it. There were, however, changes in geographical extent. Only the most powerful of kings could hold intact an empire as vast as Alexander's, and on his premature death in 323 BC, leaving only a halfwit and an unborn infant as his legitimate heirs, the empire had disintegrated into separate kingdoms, each controlled by a new dynasty descended from the Macedonian warlord who had originally seized control of it. It took a Roman emperor to reunite it, and by that time much, in Mesopotamia and further east, had been lost to the Hellenistic world.

Thus the Hellenistic world was never a political unity, though all its constituent parts, and their various rulers, looked back to Alexander as the ultimate source of their existence. Behind this there were often considerable local variations, since it included regions with non-Greek forms of civilization much older than that of the Greek world itself. At the same time, the conversion of all this into Hellenistic shape (the term itself is a 19th-century invention, but accepts the fact of the extension into this wider area of a culture that was essentially Hellenic in origin, in a world that thus became Hellenized) was not merely a matter of military conquest. The defeat of the Persian invader by the Greeks in 480/79 BC, long before the counter-crusade promoted by Philip II and executed by Alexander, had given the Greeks – with their political systems that valued independence, and above all with the military skills of their citizen foot soldier that resulted from this – a prestige that was acknowledged by their non-Greek neighbours, and already used by them for their own purposes.



Hellenistic Period: bronze statue of Mithridates VI Eupator, king of Pontus, who mounted a serious challenge to Rome in the 1st century BC, Sotheby's New York

Thus Hellenization was also a state of mind created within the non-Greek. It can be seen clearly at Phoenician Sidon, where the kings (previously influenced by Egyptian customs and form) took over the manners of the Greeks and even, in the case of Strato, Hellenized their names. Greekness was attractive in its own right, not merely through virtue of Macedonian military success, and despite the fact that many so-called Macedonians in the armies of the Hellenistic kings, following a policy of necessity already instituted by Alexander himself, were not true Macedonians by origin.

As a period, the Hellenistic age has been looked down on as an inferior descendant of its Classical predecessor. Much of the intellectual and artistic excitement seems to have gone. In the Classical tradition of western European education, based on the study of the great authors of the 5th and 4th centuries BC or earlier, the writings of the Hellenistic authors were regarded as markedly inferior in style and content alike. They were neglected, particularly in the late Roman and Byzantine schools, which were more concerned with what seemed to be the purer forms of the earlier texts. Much Hellenistic poetry, and the bulk of the work of the greatest Hellenistic historian, Polybius, was lost when the manuscripts ceased to be copied in this period. In many ways, judging from what has survived, this is understandable.

Thus the Hellenistic age has suffered from a degree of neglect. Yet it is of crucial importance, a vital link in the continuity of the Greek tradition. If it had not existed, or the continuity had been broken, our understanding and appreciation of Greek civilization would have been weakened irrevocably. The Hellenistic states took the Greek tradition, modified it, and moulded it in many ways to suit the different circumstances of what was still, reckoned in terms of the vast majority of its inhabitants, a non-Greek world, and then handed it on to their equally non-Greek but equally infatuated successors, the Romans. The Greek world transmitted through the Roman empire, it must always be remembered, was the Hellenistic world, not that of the Classical city states.

The achievements of the Hellenistic world are found in different subjects; they often depend on local or regional rather than universal circumstances. Foremost is the Museum – that is, the sanctuary of the Muses – at Alexandria, and its library. This was essentially the creation of royal patronage by the Ptolemies, the dynasty that seized Egypt as a largely self-contained area suitable for an independent kingdom in the struggles of Alexander's successors. Alexandria, which was officially "next to" rather than "in" Egypt, emphasizing its non-native character in an essentially alien land, became the capital, a substantial part of its area designated as royal, containing, in addition to the actual palace residence of the kings, the tombs of Alexander himself and the Ptolemies, as well as shrines and sanctuaries including the Museum. In addition to the actual cult of the Muses, the Museum provided a residence and place of study for scholars who were deliberately attracted to the city and paid a salary from royal resources. This royal patronage of the arts and learning, though it echoes that of the age of the tyrants, is very different from the system that prevailed in the Greek city states. The direct antecedent for it is rather Macedon under Archelaus, and later Philip II and Alexander. The intellectuals brought to Alexandria included poets, such as Callimachus and Theocritus, who often had other functions, as tutor to the royal children, or librarian. Though Alexandria was originally intended as a city for those people of Greek origin who had already settled in Egypt when it was conquered by Alexander, it expanded rapidly through an influx of new settlers from the Greek world and elsewhere, particularly in the time of Ptolemy II. It is noticeable that the intellectuals of the Museum, when we can trace their origins,

invariably came from other parts of the Greek world (Callimachus from Cyrene, Theocritus from Syracuse).

Most members of the Museum were scholars rather than creative artists, and though Alexandria is only one particular and untypical part of the Hellenistic world, it is this aspect that sets a pattern for Hellenistic achievement. The library was not merely a great storehouse of all known Greek literary texts – which the early Ptolemies collected avidly, buying up, for example, the official copies of the texts of Athenian drama, part of that city's state archive – it was also a place where the texts were studied, where necessary codified, and copies manufactured, using the readily available Egyptian papyrus. It was at Alexandria that the definitive text of Homer was established, the two great poems divided into 24 "books", and handed on to posterity. It is through Alexandria that the Classical and earlier texts survived. The commentaries and annotations on them, though generally Byzantine in their surviving form, incorporate and continue the work of Alexandrian scholars.

Even so, the area of greatest strength was in the sciences. The Macedonian kings had a personal interest, and often involvement, in practical engineering, specifically for military purposes, and this continued to be developed in the Hellenistic age, not merely at Alexandria. In other sciences, including astronomy, mathematics, and medicine, scholars based in Alexandria continued work on subjects whose study had originated elsewhere; what was different now was the far greater opportunities available. When Eratosthenes, the polymath from Cyrene, wanted to calculate the size of the earth, he was able to do so – it appears, accurately – by measuring the different angle of shadow cast by the midday sun at Alexandria during the equinox, compared with the overhead sun at Syene (Aswan) which was virtually on the tropic. The distance between the two places was known, and both were of course situated within the kingdom of the Ptolemies. Medicine, too, was briefly in an outstandingly favourable position. Careful (that is, scientific) observation of symptoms, cures, and the progress of diseases had certainly been established by the 5th century BC, by Hippocrates of Cos, and the medical school founded on that island at that time continued to flourish. Doctors trained there and elsewhere were attracted to Alexandria, and one of them, Herophilus, made startling advances in the understanding of the nervous system and optics in particular. The advantage he had was that Ptolemy made available to him the corpses of executed criminals for dissection and even, it is plausibly believed, live criminals for vivisection, forms of research that were unthinkable under the ethics of traditional Greece. Mathematics continued to be hampered by the lack of a simple numerical system; or rather, it transcended this by complex work in geometry, particularly the study of conic sections by Apollonius of Perge, who in his turn had been attracted to Alexandria.

Much of this achievement is difficult to evaluate. Very often the treatises written by these scientists have been lost. Some (particularly, it seems, in medicine) were superseded by later treatises written by those who continued the work in Roman times. Others, particularly where no further advances were made, ceased to be studied and so copied in later times; the Greek was difficult to understand, did not have any literary value, and was of little interest at Constantinople. Yet some of the most important works certainly survived at Alexandria into medieval times, and, if not copied, were translated into Arabic. Thus the Hellenistic tradition continued, not at Constantinople but at Baghdad. It is important to remember this as an instance of the continued survival of the Hellenic tradition in an area that lies outside the world of European civilization.

Alexandria was not the only place where scholars worked. Athens was associated rather with the continuing schools of philosophy, the Academy of Plato and the Lyceum of Aristotle and their successors. This made Athens, rather than Alexandria, the goal of other philosophers, such as the Phoenician Zeno of Citium in Cyprus, who taught in the Painted Stoa of the Agora at Athens, and so instituted the Stoic philosophy; and Epicurus, born on Samos of Athenian parents, whose philosophical school was established in the garden of the house at Athens where he settled towards the end of the 4th century BC. Both these schools of philosophy continued to be of major importance in Roman intellectual life. Pergamum, on the other hand, which became a Hellenistic capital city under its upstart dynasty the Attalids, was developed to emulate Alexandria, particularly in the 2nd century BC when Alexandrian intellectualism seems to have gone into a decline in the face of a lack of interest among the later Ptolemies, culminating in an expulsion of the scholars in 146 BC.

Yet in many ways the greatest importance of Hellenistic civilization lies in the interrelationship of the different cultures, Greek and non-Greek. Throughout, the Greeks maintained a supremacy that was only gradually weakened in the face of military decline. Generally, under their Hellenistic kings they enjoyed a superior position within the community and its political system, and though in the late period vast areas in the east were lost to resurgent oriental states, at the very end the Greeks were able to maintain their social supremacy (at least) through the intervention of the Romans and the takeover of the kingdoms and cities into the Roman empire. Greekness, therefore, was something desirable and to be aimed at, and there was clearly much assimilation into the Greek community by non-Greeks. Important Hellenistic Greek poets, such as Meleager, were of non-Greek origin. In the 1st century AD Juvenal, bemoaning the influence of the Greeks in Rome, has to point out that the corrupting influence comes not from true Greeks but that already, for a long time, it is the Syrian Orontes that has flowed into the Tiber.

The impact of all this can be seen in different ways. The socially superior Greeks lived in cities to which the kings often devoted great expenditure, on architecture or, at times, "shows" of various categories. Architecturally, the Hellenistic cities acquired a magnificence and solidity never found even in the greatest of their Classical predecessors, and this taste for magnificent urbanism was continued and developed by the Romans. Alexandria was a city on an altogether vaster scale, the spaciousness of the royal area contrasting with the densely built tenement blocks of the ordinary inhabitants, a contrast also found at Rome. But perhaps the most significant impact comes within the sphere of religion, expressed through the medium of the common Greek language (Koine) which became a universal second language even among the non-Greeks. Greek religion had been essentially tied to its localities. Greeks uprooted from home in the new Hellenistic settlements began

to look to the local religions as apposite to the areas in which they now lived. Sometimes this was deliberately fostered by the kings (Serapis at Alexandria), but more often it was a spontaneous development. It was the Hellenized world that spread the Egyptian Isis cult through the Greek and Roman communities, or the oriental Mithraism taken up by the Roman army. Christianity is an offshoot of the Jewish religion, though its sacred books are in the koine. Even so, it might have remained yet another obscure Jewish sect, had St Paul not seen the light outside the walls of Damascus, and promoted his beliefs in the Greek world; his epistles are a roll-call of the Hellenistic communities. Without the Hellenistic world, the world of Christian Greece would never have existed.

Summary

Extending from the death of Alexander the Great to that of Cleopatra VII (323–31 BC), the Hellenistic period is one of political fragmentation but cultural achievement. A major focus of the latter was the Museum and Library in Alexandria where scholars advanced knowledge in fields such as astronomy, mathematics, and geography and librarians assembled and studied the texts of Classical writers. Other centres were at Athens and Pergamum. Greek (Koine) became the universal second language and Greekness the universal fashion.

Hellenization

Hellenization denotes the spread of Hellenic culture in non-Greek, "barbarian" society and the process under which "barbarians" accept, adopt, and incorporate Hellenic culture. The term is closely connected with the Hellenistic period, which runs from the death of Alexander the Great in 323 BC to the death of Cleopatra, queen of Egypt, in 30 BC. Its earliest phase is marked by Alexander's successful invasion of the Persian empire; its termination by the repartition of the Near and Middle East between Rome and the new, Persian-ruled kingdom of Parthia. For much of the intervening three centuries the territory of the former Persian empire was dominated by a series of Macedonian-ruled states wherein Greeks and Greek culture enjoyed a pre-eminent position. Greek scientists formulated ideas and theories that would remain fundamental in a variety of fields until the Renaissance; art and literature flourished; and the foundations of western literary scholarship were laid.

The first modern appearance of the concept of Hellenism and Hellenization occurs in *Geschichte des Hellenismus*, G. Droysen's great three-volume work published between 1833 and 1843. He viewed the Hellenistic period as the time in which, in the territories conquered by Alexander the Great, Greek and Near Eastern cultures were intertwined to create the cultural background from which Christianity emerged. Archaeological excavation also played an important role in the formulation of the concept of Hellenism. The discovery in Europe and Asia of Greek sites of the Hellenistic period has provided information on the physical setting and material culture of the population of these new Macedonian kingdoms and their neighbours; and continues to do so. Archaeology has yielded a wealth of new written evidence – in the form of papyri and inscriptions on stone – which gives scholars a detailed view of the government and society of a major state, Ptolemaic Egypt. The creation in the 19th and 20th centuries of modern European empires in regions once dominated by the Hellenistic kingdoms was a further spur to reassessing the Hellenistic period. These developments encouraged scholars to see Alexander and his Macedonian successors as precursors of contemporary events. In parallel, scholarship was adding new evidence to Droysen's view of Hellenistic civilization as a mixed culture which, although Greek in character, had been enriched by the incorporation of features derived from ancient Near Eastern cultures.

Is Hellenization a term that reflects the reality of an ancient society, or a term and concept created by modern scholars in the course of their studies? Is it a tool, useful shorthand, or a phantom? According to G. Bowersock, "Hellenization is ... a modern idea, reflecting modern forms of cultural domination."

The term "to Hellenize" is first encountered in Thucydides (2. 68), where it is used in not a political but a linguistic context. The acceptance and use of the Greek language by non-Greek societies is known from periods other than the Hellenistic. For example, in the Persian empire of the 5th and 4th centuries BC, whose outlook was anti-Greek, the Greek language was adopted by the Lycian dynasts Pericles of Limyra and Mausolus. At the same time Mausolus avoided the Panhellenic sanctuaries, preferring the local Carian shrines, and denied proxeny (diplomatic representation) to the citizens

of Knossos. Greek craftsmen were used widely by local rulers in Anatolia and around the Black Sea to create royal and elite culture long before the Hellenistic period, as is witnessed in the Achaemenid empire or the Thracian kingdom. But this can hardly be described as Hellenization, in which the local melds with and into the Greek. The ideology and everyday life of local rulers remained resolutely untouched; the Greek element extended little beyond a veneer of sophistication, a series of external, material attributes.

In the wake of Alexander the Great's conquests, Greeks moved to the east to populate new regions and establish new cities. Alexandria, Antioch, and other cities were founded. In the Hellenistic period Alexandria, with its library etc., can better be considered the centre of Hellenic culture than mainland Greece; Ai Khanum, Alexandria on the Oxus in northern Afghanistan, with its broad streets, monumental temples, large gymnasium, and theatre, was much more impressive than Athens. Heraclides Creticus warned those travelling from the east not to be disappointed by their first impressions of Athens and other famous cities in metropolitan Greece – the rather run-down houses, the old-fashioned streets, etc. Hellenistic historians themselves considered the new cities in Asia Minor to be melting pots in which Greek and non-Greek cultures and peoples met, mingled, and created a new cosmopolitan civilization.

Greek culture was dominant from the Mediterranean to the borders of India. Everywhere Greek was the language of government. The traditions of Archaic and Classical Greek culture were admired and followed, but not blindly; new features taken from local cultures were introduced. For example, the reliefs on the great altar at Pergamum may seem at first alien to the tranquillity associated with Classical sculpture; in fact, they resemble the sculpture on the pediment of the Parthenon. In the Hellenistic world culture was uniform only on the surface. There were differences between the culture of Aegean Greece and that of the new kingdoms of Asia and Egypt. In the former, writers and artists adhered strictly to centuries of tradition: local dialects and traditional cults and festivals flourished. From a cultural perspective an old Greece of tradition can be identified in the Hellenistic period and beyond; but in the east there was a "new Greece" which admired traditions but was not constrained by them, adding new elements and concepts absorbed from local societies, their practices and cultures. This appears to be more a case of orientalization than Hellenization, a case different from that in Greece at the beginning of the 1st millennium BC. The terminology deployed by modern academics usually fails to penetrate the intrinsic nature of the historical or cultural events in antiquity that it is used to describe. This is as true of the term "orientalization" as it is of "Hellenization". What is being described in both cases is the spread and intermixing of different cultures. In the Hellenistic period different ethnic groups absorbed Hellenic culture and transmitted aspects of their own culture to Greeks. This was a side effect of political developments. If a label has to be attached to this, then "cosmopolitanization" would be more appropriate than either "orientalization" or "Hellenization".

In the Hellenistic period in Greece the polis changed under social and economic pressure. Its political life narrowed and became harsher. New studies suggest that in the Seleucid empire the structure of the polis was less strong than traditionalists seek to depict. There was a continuity with Achaemenid Persian and Babylonian structures. The effects on Jewish culture of Hellenization on the one hand and Seleucid influence on the other remain unclear and disputed.

The Greek polis with its culture survived into the Roman period, and the Romans consolidated their rule in the east through the introduction of the polis. Evidence shows that in the Roman period the only significantly Hellenized part of the population was the elite. Roman culture itself was heavily influenced by the Greek, copying Greek sculpture, for example, and worshipping the same gods though under Roman names. Written Greek was in active use along with Latin and Aramaic. The Byzantine empire inherited not only the Greek language; Christian epigrammatists echo the idioms of their pagan predecessors.

Heraclitus *fl. c.*500 BC

Philosopher

A citizen of Ephesus, Heraclitus was the first philosopher to approach the study of nature from the standpoint of the human condition. Writing riddling sayings in a dense aphoristic style, which have survived as quotations in later writers, he criticized poets, philosophers, and ordinary people for their failure to see the meaning inherent in the world. There is an order in nature, a *logos* (governing principle), that is always present, but which men miss both when they experience it and when they are told the truth about it, for they move through the world like sleepwalkers. Study of the facts will not teach understanding; what is needed is an understanding of how things fit together. What the *logos* teaches is that all things are one.

Heraclitus inherited from earlier philosophers the view that some one kind of stuff is changed by transformation into all other kinds of stuff. Whereas Thales had said that everything comes from water and Anaximenes that everything comes from air, Heraclitus held that everything comes from fire. Fire turns into water and half of the water generated turns into earth and the other half back into fire, preserving the same proportions of matter through the changes (fr. 31). Unlike his predecessors, who believed that the world came to be from unstructured matter, Heraclitus states that the world order "always was and is and will be everliving fire, kindling by measures and going out by measures" (fr. 30). It is the kindling and quenching of fire that preserves the world. By identifying fire, the most changeable reality, as the basic substance of the universe, Heraclitus seems to be stressing changeability. "Onto those stepping into the same rivers other and other waters flow" (fr. 12): the changing waters constitute the river. Thus change underlies and makes possible the structure of the world and the things in it.

According to Heraclitus, opposites are somehow one: the living and the dead, the waking and the sleeping, the young and the old are the same because they change into one another (fr. 88). The opposing tensions of the bow and the lyre make them work. Day and night are one. "The road up and the road down are one and the same" (fr. 60). What seems to make all things one is their interconnectedness in the series of transformations: there is one road with two-way traffic, one process with two-way changes going on. In the changes of fire there is a constant equivalence of material, something like a conservation of matter, which Heraclitus compares to the exchange of gold for goods and goods for gold (fr. 90). The value of the goods remains constant even though the items exchanged vary. The ultimate reality, then, is not any substance that travels the road, but the process of change itself, the law of transformations symbolized by fire. Overall, Heraclitus seems to have started with a picture of the world much like that of his predecessors, but he moved far beyond them in finding the source of unity in the world not in a single original substance such as water or air, but in a unified order of change. His predecessor Anaximander had seen cyclical changes such as day and night, summer and winter, as embodying acts of strife between opposites to be corrected by a cosmic principle of justice. Heraclitus replies that justice *is* strife, for opposition holds the world together.

Souls arise from the moist and they perish if they return to moisture. It is best for the soul to be fiery, and better souls receive a better lot after death. "Moderation is the greatest virtue and wisdom, to speak and act truly, perceiving according to their nature" (fr. 112). People should rely upon and defend their laws, but above all the one divine law by which all human laws are "nourished", presumably the *logos* (fr. 114). Human nature, then, mirrors nature as a whole, and human society is ultimately governed by the same laws as the cosmos.

In the 4th century BC Plato attributed to Heraclitus the claim that "you can't step into the same river twice" (Cratylus, 402a). The claim, which seems to be an interpretation of fragment 12 (quoted above) – perhaps one Plato got from Cratylus, a Heraclitean – suggests that for Heraclitus nothing stays the same. Plato's own philosophy was heavily influenced by the flux theory he attributed to Heraclitus: he held that the world of sensible objects was always changing. Plato and Aristotle also attributed to Heraclitus the view that opposites are identical (not just the same by virtue of being stages in a single process), which led them to say that he accepted contradictions. Henceforth Heraclitus became known in the doxographical tradition as a philosopher of flux who embraced contradiction and hence had an incoherent philosophy.

In the 3rd century BC the Stoics revived the view that all things come from fire, and also attributed to Heraclitus their view that there are periods of world-conflagration in which all substances turn back into fire, after which the world is regenerated from fire. In the early Christian era intellectuals sometimes saw Heraclitus as a proto-Christian because of his ethical views, his emphasis on *logos*, and his belief (on the Stoic interpretation) in a fiery judgement on the world.

Herakleios *c.*575–641

Emperor

The son of Herakleios and Epiphania, the emperor Herakleios (610–41) was of indeterminate Armenian descent. Between 600 and 610 he lived in Africa with his father, the exarch of Carthage, and his stay there probably made a great impression on him. In 608 he and his father, together with his nephew Niketas, successfully rebelled against the emperor Phokas, initially claiming the title of consuls. Herakleios arrived at Constantinople by sea, executed Phokas, and overcame the resistance of Phokas's brother Komentiolos in Anatolia. His wife Fabia/Eudokia, of African origin, gave birth to a son, Herakleios Constantine, but she died in 612. He tried unsuccessfully to persuade the Sassanian king Khusrau II to desist from his invasion. He also consolidated his control over the armies and eliminated potential rivals such as the general Priscus.

The first two decades of Herakleios's reign were almost entirely taken up with checking and reversing disastrous and embarrassing Persian conquests, which extended over Syria, the Holy Land, including Jerusalem, and, with enormous negative consequences for tax revenues, Egypt. Anatolia was also ravaged. He broke with recent precedent and commanded imperial armies in person, far from Constantinople. In 622 he won initial limited morale-building victories over the Persians in Anatolia. In 624 he set out on an ambitious campaign in the East to break the Persian threat, leaving a regency under his second wife Martina and the *vicarius* (prefect) Bonus, who together with the patriarch Pyrrhus successfully weathered an Avaro-Persian siege and blockade of Constantinople. Herakleios managed to defeat the Sassanian generals Shahin and Shahrbaraz in 625 and 626. After successfully negotiating an alliance with the Kök Turks in the Caucasus, he planned a bold invasion of Mesopotamia from the north; this depended on his alliance with the Kök Turks and on his diplomacy with Shahrbaraz, who broke his allegiance to Khusrau II. In December 627 he defeated the Persians on a plain east of the ruins of ancient Nineveh, then proceeded to occupy and ravage strategic Persian territory, including Khusrau II's residence at Dastagerd. Herakleios's victories in Mesopotamia encouraged the Persians to overthrow Khusrau II in early 628 in favour of Kawad IV/Shiroes, who agreed to peace terms, which included the restoration of Byzantine territory, property, prisoners, and reparations. Herakleios met Shahrbaraz, who agreed to evacuate Byzantine territory. He personally accompanied fragments believed to be the True Cross to Jerusalem in March 630. Herakleios's power and hopes were at their apogee in 630, at the same time as he was unsuccessfully trying to end strife in the Church by giving his official support to the theological doctrine of Monotheletism or one will in Jesus Christ. In fact, ecclesiastical dissent intensified. His theological policies satisfied very few and aroused the bitter opposition of such prominent ecclesiastics as Maximos the Confessor and patriarch Sophronios of Jerusalem. His ambitious plans for forging a new relationship with Persia foundered with the assassination of his protégés Kawad IV and the ambitious general Shahrbaraz.

Herakleios devised new imperial ceremonies at Constantinople, perhaps to compensate for the violent circumstances surrounding his seizure of power. Many scholars also believe that he created new precedents for the official use of the Greek language by elevating the Greek term *basileus* to be the normal term for emperor, but others dispute the significance of this. He encouraged a thriving Hellenic literature in prose and verse. Prominent authors who wrote in Greek included the historian Theophylactos Simokattes and the poet, panegyrist, and hagiographer George of Pisidia.

Herakleios neglected the defences and prosperity of the Balkans and most of the Greek mainland and islands, giving priority to the security and rehabilitation of endangered or recently recovered territories and cities in western Asia. His policies probably contributed to significant 7th-century Slavic and Avar inroads into the Greek mainland. The evidence for his personal visits to mainland Greece or the islands of the Aegean is insecure, but it is clear that he spent much more time in western Asia than in mainland Greece.

His military victories depended heavily on exploiting divisions within the ranks of his opponents and encouraging them to switch sides; he fostered the breakdown of morale, and exacerbated hatreds and rivalries. His skills in diplomacy, deception, and subversion were at least as important as his military skills, despite the efforts that his propagandists made to celebrate him as a great captain. These skills proved to be of little value to him when he confronted the Muslim invasions that started in the early 630s. He did attempt to devise resistance, but he lived to see Syria, the Holy Land, and upper Mesopotamia fall to the Muslims, and Egypt begin to totter. He attempted in vain to prevent local authorities from reaching separate accords with the Muslims. His tactics and strategy were inadequate to check or repel the Muslims, but he continued unceasingly until the end of his life to devise new defences and techniques to halt their advance in Anatolia and Egypt. The evidence for his skills as an institutional reformer is weak, although it appears that he did order his treasurer (*sakellarios*) Philagrios to take a new census, presumably for fiscal purposes, for the entire empire. It is unclear whether Philagrios managed to implement this census and, if so, to what extent. But even though Herakleios suffered from severe bouts of illness late in his life, it appears that he tried to stiffen morale and military defences against the Muslims.

Herakleios was the last Byzantine emperor to visit an extraordinarily wide range of famous ancient cities and sites and

relics. He saw Carthage, Jerusalem, Nineveh (or its vicinity), Antioch, Damascus, and what he believed to be Noah's Ark and the True Cross. No subsequent emperor would ever see such a swathe of lands. He apparently envisioned an empire of vast and diverse scope and never contented himself with purely Greek constituents of it. His controversial second marriage to his niece Martina and the ensuing rivalry for the succession jeopardized and wrecked many of his hopes and plans. He depended heavily on family members to bolster his strength, but their rival passions nearly destroyed the empire at his death. He was an extraordinary and unique figure who experienced supreme victories and defeats. At his death the empire was in an extremely tenuous condition. He reigned in an age of increasing devotion to the cults of saints in almost every corner of his empire. He likewise had to accept a rising tide of apocalypticism with its fears and doubts. He sought to associate such saints as St Theodore of Sykeon and their powers and prestige with himself. But powerful ecclesiastics such as Sophronios and Maximos the Confessor resisted him, and their successors, such as St Anastasios of Sinai, continued to criticize his reputation and that of his dynasty long after his decease.

Biography

Born *c.*575 the son of Herakleios, exarch of Carthage, and Epiphania, Herakleios was of indeterminate Armenian descent. From 600 to 610 he lived in Africa, but then seized power for himself. The first 20 years of his reign were spent recovering territory lost to the Persians. Later in his reign he saw much of the same territory lost again, this time to the Arabs. At his death in 641 the empire was in a very weak state.

Heresy

Heresy, in its religious-canonical sense, is more easily defined than historically identified. Simply put, it is the denial of any or all accepted dogma of an orthodox set of beliefs, teachings, or tenets. But what exactly constitutes orthodox dogma has been a very difficult question as is evidenced by the fact that in the 1st century AD Jews accused Christians of being heretics and vice versa. The emperor Julian (361–63) – "the apostate" according to Christians – accused Christians of being heretics, unlike Jews and Hellenes. Further, while most Christians may agree that heretics deny or repudiate biblical doctrine, the teachings of the tradition, or the creeds of the ecumenical councils, there are and always have been extraordinarily diverse views as to what biblical doctrine is or how the creeds are to be interpreted or the number of creeds to which all Christians must assent. Indeed, on occasion, certain ecumenical creeds themselves have been in or out of favour or had portions rejected, for example, the papal refusal to recognize certain canons of Constantinople I (381) and Chalcedon (451) which they felt jeopardized their primacy.

The word "heresy" originally had no pejorative connotation, meaning, as its etymology reflects (Greek *hairesis* from *haireomai*, "to choose"), simply "choice" in the sense of "assent" to a set of philosophical or religious beliefs. The term was used in Hellenistic times also to refer to the particular philosophical school or sect to which persons gave allegiance by choice, e.g. Phariseeism or Saduceeism, sects, "choices", within Judaism.

In New Testament writings the term lacks the formal and technical designation it acquired after the calling of councils to establish orthodox belief. The neutral Hellenistic sense appears in Acts 5: 17 and 26: 5, where Paul refers to the Pharisees as "the strictest sect [*haeresis*] of our religion".

From the sense of heresy as subdivision there appears the earliest pejorative sense of heresy. In Acts 24: 5 Paul resists the designation of Christians as a sect – "the Nazarene sect" – within Judaism, even though he refers to the Pharisees as a sect of Judaism. "I admit that in serving the God of my forefathers I follow the path which they call a heresy." Paul's objection is not simply resistance to subordinating Christian groups to Judaism; it is also that Paul assumes Christians ideally to be one unified community. And here he employs the pejorative sense of heresy: the practice of introducing, into the Christian community, divisiveness and sectarianism; i.e. sects or groups that, by distinguishing themselves from the rest of the Christian community, dissolve Church unity. Whether the basis for the heretical redivision is doctrinal difference or unique practice is immaterial to Paul. The evil of heresy consists in "dividing the body of Christ" which constitutes the Christian community. The "Judaizers", who required non-Jewish converts to Christianity to observe for a time the requirements of the law, not only introduced new teachings and requirements for salvation but also initiated a new religious practice for Christians, all without authority. Thereby they introduced factions within Christianity and garnered vigorous opposition from Paul. (See also Galatians 5: 20, 1 Corinthians 11: 19, and Titus 3: 10.) Peter also applies the term intramurally, warning Christians of false prophets and false teachers who introduce sectarianism (heresies): "lying teachers who will bring in destructive sects" (2 Peter 2: 1). Both elements of heresy are present in this passage: heterodoxy and disunity.

While combating heresy begins with the New Testament writers (Paul v. Judaizers; John v. Docetists), as early as the late 2nd and early 3rd centuries writers began composing lists of heretical movements and constructing arguments against them. Among the earliest is Justin Martyr's *Syntagma*, a collection of heresies and counter-arguments, often quoted in another early work, Ireneaus of Lyons' *Adversus Haereses* which opposed Gnosticism and Montanism. Hippolytus of Rome also wrote an early and important work, the *Elenchus*, a list of 33 heresies and refutations notable in its strategy of tracing all heresies to false philosophical schools and cultural influences. Among the Fathers, heresy is widely understood as a departure from the faith which is more often a synthetic and syncretistic

corruption of orthodoxy than complete repudiation of it. Heretics interpret the teachings of the Church and its tradition by wedding them to some other religious or philosophical system, of which Manicheeism would be an archetype.

Perhaps the most noteworthy works of the late 4th and early 5th centuries are the *Panarion*, by Epiphanius of Salamis (367), and *De Haeresibus* of St Augustine of Hippo (427). The former is a "medicine box" of 80 antidotes to be administered against those infected by heretical poisons. The latter, which relies directly on an edition of the former, was written at the request of one Quodvultdeus who asked for an exhaustive list of heresies from the earliest beginnings of Christianity. In this work, heretical nominations derive usually from the founder of the heresy or the figure of heretical worship, e.g. Simonians, Menandrians, Saturninians, Basilidians, Nicolaites, Gnostics, Adamites, Arians, etc.

St Augustine's work contains an important caveat. Not all error is heretical; nor is every theological interpolation culpable. Catechumens may have been erroneously taught or children may be misled by parents. Such persons are not heretics, having been given no alternatives from which to choose or the understanding to believe otherwise. What is crucial is the disposition of the believer. If one in error readily receives correction and assents to proper teaching, he or she is without blame. The moral failure of heretics is a kind of pride: the audacious presumption that he or she knows better than scripture, the tradition, authority, and the Church. In the east John of Damascus wrote his own *On Heresies* which belongs to the same genre of heretical lists composed in the west, though John lists a number of unique heresies and heretical practices.

In the patristic period a heretic is anyone who introduces into the community disunity as a result of doctrinal or practical difference and refuses all efforts at compromise. But the community from which one dissents needs doctrinal and practical unity to begin with. Much patristic literature is devoted to theological speculation and doctrinal exploration in an effort to clarify Christian doctrine, thus complicating the question of heresy. The distinction becomes clearer, gradually, with the holding of ecumenical councils. During this period Basil the Great distinguishes between heresy and schism, "schism" applying "to those who separate themselves from the religious community due to reasons of church policy or otherwise reconcilable differences" (Migne, *Patrologia Graeca*, 32: 665A). This distinction appears to categorize schismatics according to minor differences of belief as well as the willingness of the dissenting party to seek compromise.

Gnosticism. The term "Gnosticism" has been applied, from Hellenistic times onward, to such diverse beliefs that any characterization risks contradiction. The word derives from the Greek word for "knowledge", *gnosis*, and implies that self-proclaimed Gnostics enjoyed an esoteric enlightenment. This enlightenment included dualist deprecations of materiality, whether personal passions and desires or attachments to the physical world, and cultivation of "spirituality". Gnostics downplayed or denied altogether the incarnation of Christ since, in their view, God's perfection could never stoop to actual association with the physical world; it is impossible to comingle natures. Thus, "Christian" Gnostics were docetists, asserting that perceptions of Christ's body were illusory and Christ's resurrection was metaphorical. Gnosticism was especially prevalent in North Africa where it allied itself to Middle Platonism. Some have seen Gnostic tendencies in Origen and Clement of Alexandria.

Manicheeism. An extraordinarily prevalent religious sect in the 3rd and early 4th centuries, Manicheeism was a form of dualism positing two ontological principles or powers, good and evil, or light and dark, thus analogous to Zoroastrianism from which it derived. It included elements of Christianity and Gnosticism and so was a theological temptation for many Christians. No less a figure than Augustine was attracted for some years by Manicheeism's emphasis on rational support for belief – however insupportable a system it may have been itself – as well as its powerful explanation of an intractable theological problem: the origin and nature of evil. Manicheeism was vigorously opposed by Christian apologists who used monotheistic and Neoplatonic arguments to show the metaphysical inconsistencies of dualism, particularly its implication that God is neither omnipotent nor the creator of all things.

Pelagianism. Introduced in Rome (*c.*380) by Pelagius, a learned monk from Britain, this doctrine, though vigorously opposed by Augustine, found general tolerance, if not sympathy, outside North Africa. Pelagius emphasized the role of free will in moral action and the contributing role that right moral action plays in salvation, arguing that one could on one's own choose and perform righteous moral acts and thereby deserve a meritorious response from God. Such a view emphasized the vital importance, therefore, of virtuous action throughout one's life as a contributing instrument of salvation. Augustine thought that Pelagius' views jeopardized God's freedom by obliging him to respond to those who performed moral acts. If Pelagius is right, human beings can make a claim upon God. Pelagius also, in Augustine's view, de-emphasized Christ's role as mediator and limited the absolute character of God's grace by introducing other medial instruments in human salvation, relegating the Church and sacraments to a secondary role.

Arianism. The views of Arius (born *c.*250) concerning the nature and status of Christ generated perhaps more controversy than any other theological issue in the first few centuries of Christianity. At least two ecumenical councils dealt directly with his doctrines, Nicea (325) and Constantinople (381). When he began teaching the view for which he is most notable – Christ is not coeternal with the Father – in North Africa, bishop Alexander of Alexandria immediately condemned him and Arius fled to Nicomedia. There he acquired a powerful following including, at one time, the emperor Constantine himself, who recalled Arius from his forced exile after he was condemned in the Nicean council. His doctrine was opposed by Athanasius of Alexandria who was, for a time, himself exiled for his opposition. The anti-Arian party gradually carried the day. Largely as the result of Arianism, much theological speculation focused on the nature of Christ, the Trinity, and the relations among the persons of the Trinity. Among the more noteworthy of the discredited views were Apollonarianism, Monophysitism, and Monothelitism.

Apollonarianism. Apollonarius, bishop of Laodicea, was friend and ally to Athanasius. His opposition to Arius led him to de-emphasize the humanity of Christ, arguing that in place of a human soul, Christ's soul was replaced by the divine *Logos*. He later rescinded his denial of Christ's human soul,

but then argued that Christ had a uniquely heavenly intellect (*nous*). Apollinarius was condemned at the Council of Constantinople (381) for views that were labelled in the 7th century as "monophysite".

Monophysitism ("one-naturedness"). Monophysitism sought to explain how a divine personage could become mortal and what such a union of natures means. It was a doctrine denying the dual nature of Christ – divine and human – arguing, in some versions, that Christ was completely divine with no human element – that the divine element overwhelmed or never contacted the human (e.g. Apollinarianism) – or that a new, third nature, a mixed divine–human nature came of the union. Monophysitism, after a particularly violent and destructive history during which some emperors supported it while others fought it vigorously, was condemned at the Council of Chalcedon (451).

Azymes ("without yeast, leaven"). This dispute arose originally between the Byzantines and the Armenians but later (11th century) arose between the Byzantines and the Western Church. The issue was whether the Eucharistic bread should contain yeast. The Armenians and the Latins argued that, because Jesus broke unleavened bread at the last supper, the Eucharistic representation should likewise be unleavened. The Byzantines argued that scripture uses the word for leavened bread, *artos*, and based upon the same precedent, leavened bread should be used. The Byzantines also saw theological symbolism in leavened bread, e.g. resurrection.

Iconoclasm. In the 8th and 9th centuries in the Eastern Church a movement towards radical asceticism argued that the widespread use and veneration of icons constituted worshipping graven images forbidden by the second commandment. Iconoclasts further denigrated all use of icons and denied their sacred character. The basis for their argument, along with the argument from idolatry, seems also to have a basis in apophatic theology, the radical denial of any proper predication of the divine nature, and hence to emphasize the misleading and corrupting character of any representation of God. The 8th-century iconoclastic movement found a champion in Leo III (716–41) who ordered the removal of a famous icon and thereby instigated a riot. He further agitated iconophiles – he had some executed – by forbidding all iconic representations of saints. Constantine V (741–75) continued the iconoclastic movement, condemning icon veneration at a council in Hieria in 754.

Filioque. The *filioque* dispute focuses on the origin and nature of the Holy Spirit. At issue is whether the being of the Holy Spirit emanates from the relation of the Father and the Son ("filioque") or from the Father only. The disagreement arose when the Spanish council at Toledo (589) added material to the resolutions of Nicea I and Constantinople I. The view was attacked rigorously by Photios (866) and originally rejected by John VIII at the Photian council of 879–80. The council forbad all additions, subtractions, or modifications of the creeds. The Council of Lyons (1274) affirmed the *filioque* doctrine, which still is rejected in the East.

In 1054 the doctrinal and jurisdictional disputes between the papacy and the Eastern Church led to mutual excommunications, with cardinal Humbert excommunicating patriarch Michael I Keroularios, who, in turn, excommunicated cardinal Humbert. Though each side accused the other of heresy, the split was viewed as a schism and there have been numerous attempts at reunion, such as the mutual retraction of excommunications in 1965.

Palamism. In 1344 John XIV Kalekas, for reasons that seem as much political as doctrinal – he had previously endorsed Palamas's doctrinal fidelity – excommunicated Gregory Palamas. The doctrinal dispute focused on the knowability of God's essence and the approachability of creature to Creator. Palamas's opponents, particularly Barlaam of Calabria, felt that he elevated the created human soul to the Creator's divine level and diminished God's transcendence. Palamas argued that, while God is in essence unknowable and unapproachable, his energies or powers are not, and one can encounter God directly through these powers by employing the discipline of monastic prayer. Furthermore, through the incarnation, one can establish an immediate relationship to God, i.e. participate in God. Such a participation leads to a direct knowledge of God and makes possible deification. Palamas's views were endorsed by three local councils (Constantinople 1341, 1347, 1351) and with the last council came complete vindication. Canonical approval of Palamas's doctrine was subsequently added to the *Synodikon* of Orthodoxy.

Protestantism. Patriarch Cyril Lukaris, in the 17th century, had strong sympathies with certain Protestant doctrines, particularly Calvinism, which he sought to infuse into the Orthodox faith. He aroused the suspicions of numerous Orthodox bishops by publishing a "Confession of Faith" (1629) in which he professed iconoclasm, repudiated the traditional view of the priesthood, and asserted certain Calvinist views, e.g. the doctrine of "sola scriptura". He was accused of heresy and dethroned.

Controversies such as that surrounding Palamas illustrate the difficult nature of determining orthodoxy and heresy in the history of the Church. With the doctrinal and ecclesiastical solidification of Christianity over time, the procedure has become more precise and orderly.

Herodas

Poet of the 3rd century BC

So little is known about Herodas (or Herondas, as he is sometimes called) from sources besides his own poems that neither when nor where he lived and wrote can be determined with any certainty. Various chronological hints in his first, second, and fourth poems point to composition dates in the 270s and early 260s BC. If the settings of his second poem (the island of Cos) and of his sixth and seventh poems (probably in Asia Minor) may be connected with the dwelling-place(s) of the poet himself, Herodas probably spent some periods of his life in parts of the eastern Aegean. His first poem exhibits a certain amount of knowledge and praise of Ptolemaic Egypt, but this does not necessarily indicate that Herodas lived there for some time as well (if he did, he is most likely to have lived in Alexandria).

It was through the fortunate discovery of a papyrus (British Library Pap. 135, first published in 1891) that scholars gained knowledge of substantial parts of the poems of this early Hellenistic author, which exhibit many features typical of Greek poetry of that age. Seven of Herodas' poems are readable in a more or less complete form (the much more fragmentary nos. 8 and 9 are largely unintelligible); their length ranges from 85 to 129 verses, and they are collectively called mimiambs, an appropriate title for their composite nature, as on the one hand their content has much in common with the form of low-level popular drama called mime, while on the other their metrical form and language are taken from iambus, an archaic form of very personal and often invective Greek poetry whose main proponents were Archilochus and Hipponax. Mimes, too, had already existed for hundreds of years before Herodas and continued to do so until (at least) the end of antiquity; they depicted scenes of everyday life (with frequent and rather explicit inclusion of sexual themes and situations) and down-to-earth or even vulgar characters, and they were performed – depending on their length and plot – either by a single person or by a small troupe of itinerant actors; their texts were mainly in prose, and their language usually in the local dialect (Doric in Sicily and southern Italy, for example). By combining mimic content with the form of ancient iambus, Herodas gave his poems a rather rigid form. His main model being Hipponax of Ephesus (to whom he refers at the end of his eighth poem, though the badly mutilated text does not allow us to glimpse specifics), he took over Hipponax's Ionic dialect and his peculiar metre, the so-called choliambos, or limping iambic, in which the penultimate syllable – which would normally be short – is long; this introduces a rhythmical disturbance which noticeably increases the sense of mocking and ridicule of the poems' content. Even within these rigid formal boundaries the scenes and situations depicted by Herodas at first sight seem completely natural, which is a great compliment to the poet's mastery of his art.

A brief examination of the poems' content gives an idea of their characteristic features and their connections with older and contemporary literature. Remarkably often women are the main characters. In the first mimiamb ("The Matchmaker or Procuress") a woman living alone (her companion has gone to Egypt) is visited by the title-figure, who tries to arouse her interest in another man, but is told in rather plain terms that this is out of the question. The second ("The Brothel Keeper") is a plea spoken by the title-figure before a jury: the brothel keeper (a figure familiar from Greek comedy) accuses a foreign ship's captain of attacking his establishment in order to capture a girl, and he tries to project the image of an honest, law-abiding resident, but the poet lets the meaner sides of his character (most of all greed) peep through his words. In the third ("The Schoolmaster") an angry mother drags her wayward son to his schoolmaster and asks him to give the naughty boy a good beating to set him on the right track again; the son, by feigning repentance, avoids the thrashing. The fourth ("The Women who Offer Thanks and Sacrifice to Asclepius") shows two women offering a cock to Asclepius (for curing an illness) and admiring the artworks in the god's temple precinct; Herodas' contemporary Theocritus treated a similar subject in his fifteenth *Idyll*. The fifth mimiamb ("The Jealous One") depicts the most mimic theme of all these poems, adultery (a mime preserved on another papyrus fragment, P.Oxy. 413 verso, shows many similarities). A mistress accuses her slave, whom she uses as a sexual partner, of having bestowed his favours on another woman as well and gives orders for him to be flogged and tattooed; finally, though, she accedes to a plea for mercy uttered by another (female) slave who is dear to her. In the sixth mimiamb ("The Women who are Friends [*or* In Private]") a lady (Metro) visits her female friend (Koritto) and eagerly inquires who the crafty cobbler is who provided her with that most wonderful dildo which she has recently seen with another friend of Koritto's; Koritto is somewhat annoyed that her delightful secret is already going round, but then proceeds to reveal the cobbler's name, Kerdon, whom Metro then rushes out to find. Metro and Kerdon (now a speaking part himself) appear again in the seventh mimiamb ("The Cobbler"), where Kerdon tries his sales pitch in front of some women whom Metro has brought into his shop, and there ensues some very amusing haggling about shoes and prices (and some hinting at other leatherware as well...). In the badly mutilated eighth mimiamb ("The Dream") the poet himself apparently speaks, relating a dream in which he takes part in a Dionysiac festival and competition; at the end he remarks on his relationship to Hipponax. Of the ninth ("The Breakfasting Women") only fragments of the first 13 lines survive and give no clear idea of the poem's narrative. Scholars disagree as to how these amusing pieces were presented to their contemporary audiences: by one reciter (Herodas himself?) alone or by several actors playing the various roles (ranging from two to four in the single poems)? Their very restricted length (see above) rather points to the former as most likely.

Only very few fragments of two, three, or four other poems by Herodas appear as citations in other literature, but they are very few and their meagreness shows that Herodas was not a much-studied author after Hellenistic times. He was still read, though, in Egypt in the 2nd century AD, as two papyri (Brit. Lib. Pap. 135, mentioned above, and the slightly later P.Oxy.

2326) demonstrate. Ironically, it is not a Greek, but a Roman, Pliny the Younger, who paid Herodas the biggest compliment by putting him on the same level as Callimachus in a letter to a friend (4. 3. 3). Soon after, Herodas almost completely vanished from the literary consciousness of antiquity, only to be reborn from the sands of Egypt at the end of the 19th century.

Biography

The date and place of his birth are unknown, but Herodas (or Herondas) seems to have flourished in the 270s and 260s BC, and may have lived some of the time in the eastern Aegean. He wrote "mimiambs" depicting scenes of everyday life. Seven poems survive largely intact, and fragments of others.

Herodes Atticus *c.*AD 101/03–177

Sophist and patron

The Athenian Herodes Atticus was the most striking example in his time of the native Greek who, although highly successful within the political system of imperial Rome and perfectly integrated into upper-class Roman society, nevertheless remained entirely Greek in his cultural orientation. His full name was Lucius Vibullius Hipparchus Tiberius Claudius Atticus Herodes, and he was the son of a very rich Athenian, Tiberius Claudius Atticus Herodes, and of Vibullia Alcia, a niece of her husband. Like his son after him, the father succeeded in penetrating the highest levels of Roman administration. He was the first Greek from old Greece to reach the suffect consulship, around AD 132, and probably also its first member of the Roman Senate.

Already in his education Herodes combined Greek and Roman elements. In Greek he followed the normal upper-class curriculum of his day. He studied literature with Theagenes of Cnidus and Munatius of Tralles. In rhetoric he numbered among his teachers the Athenian Secundus as well as some of the most famous sophists of his day, Scopelian, Polemo, and the Celtic polymath Favorinus. He rounded out his education with a course in Platonic philosophy under the renowned Calvenus Taurus.

He was, however, also educated in a Roman milieu, in the family of P. Calvisius Tullus Ruso, *consul ordinarius* in AD 109 and the grandfather of the future Roman emperor Marcus Aurelius. This sojourn led not only to a familiarity with upper-class Roman society but, presumably, also to his acquiring a perfect and accent-free Latin, a valuable and uncommon asset for a Greek.

As might be expected from a son of the rich and prominent Atticus, Herodes ascended to high office in Athens. Already in his early twenties he became an *agoranomos*, a supervisor of the market; soon after, in AD 126–27, he held the prestigious post of the eponymous archon, a post that not even Hellenistic kings and Roman emperors had disdained. As an ex-archon he also became a life member of the illustrious council of Areopagus.

After his archonship at Athens, Herodes began his Roman political career. Although not clearly attested, his first office must have been one associated with the vigintivirate, possibly that of a *quinquevir litibus iudicandis*. Next, he was honoured by the emperor by being chosen as *quaestor principis*. After his tribuneship and praetorship he was appointed as a *corrector* of the province of Asia for AD 134–35. His career reached its culmination in AD 143 when, as the first Greek from old Greece, he became a *consul ordinarius*, just as his father Atticus had been the first suffect consul. Herodes was subsequently offered the chance of a proconsulship or, possibly, of a second consulship but he turned down this offer.

In addition to his political posts Herodes was also honoured with other offices of great social prestige. He was chosen to be the *agonothetes* (exhibitor) of the Panathenaic games and of the Panhellenia. He was also the *archiereus ton sebaston* (high priest of the Augusti) and the priest of the *Tobacchoi*, as well as a *sodalis Augustalis* and a *sodalis Hadrianalis*.

Herodes was also possibly the most generous private philanthropist of the Roman empire. His greatest Athenian building projects were the Panathenaic stadium, clad in white marble, and the Odeum, roofed with costly cedar. He also built a roofed theatre at Corinth and rebuilt and enlarged the stadium at Delphi. Another of his major structures was the aqueduct at Olympia to supply drinking water for the spectators at the Olympic Games. Numerous less expensive benefactions are also attested. Herodes dreamed of crowning his benefactions with an even mightier accomplishment, the building of a canal across the isthmus of Corinth, a project attempted but

not completed by the emperor Nero. He did not, however, muster the courage to ask the emperor for permission.

Although famous for his philanthropy and very successful in public life, Herodes was probably best known at large as the leading figure in the Greek-language cultural movement known as the Second Sophistic. He was the acknowledged master among his fellow sophists, to wit performers and teachers of display oratory. Their show declamations were perhaps the most popular form of Greek-language artistic entertainment from the second half of the 1st century AD to the first half of the 3rd. In these performances a sophist was often expected to deliver a speech, usually on a topic of Classical Greek history proposed by the audience, with only a brief period of time allowed for preparation. Much was expected of these performers by their knowledgeable audiences. Their grasp of Greek history had to be accurate, and they were also required to be Atticists, i.e. to use a Greek borrowed from Classical Greek writers, a Greek that in vocabulary, morphology, and syntax often departed from contemporary educated speech. Above all, they had to express their subject matter in striking and original diction. In addition, the successful declaimer had to act out convincingly, and in a euphonious voice, the historical character he was impersonating. It is noteworthy that despite his immersion in his Roman *cursus honorum* and his marriage into a patrician Roman family, Herodes entirely avoided cultural Romanization and by preference invested his artistic and intellectual energies in an art form not only entirely Greek in language, form, and content but even associated by some with anti-Roman sentiments.

As a teacher, Herodes educated many of the prominent sophists of the next generation and was honoured by being chosen as the teacher of rhetoric of the future emperors Marcus Aurelius and Lucius Verus.

The most lasting legacy of the Second Sophistic, hence of Herodes Atticus, its most resplendent representative, was to entrench among the educated the use of Koine, a common Greek that had reincorporated into itself many of the linguistic features of Classical Greek that had disappeared in oral and written usage during the Hellenistic and early Roman periods. Because this repristinated Greek was adopted by the state and by the educated in the Byzantine period, it enjoyed an existence of well over a thousand years.

Of the written works of Herodes nearly all have been lost. Philostratus, his biographer, writing in the 3rd century AD, reports as extant very many letters, speeches, and diaries, as well as handbooks and anthologies. Still extant is a speech called *Peri Politeias* (On the Constitution) attributed to Herodes by the Codex Crippsianus. It represents, perhaps, the ultimate triumph of Herodes as the perfect Atticizing sophist. The writer's knowledge of Greek history and his skill at avoiding non-Classical Greek are so remarkable that several modern scholars have deemed this speech to have been written by a Greek of the 5th or 4th century BC.

Herodes was less fortunate in his family life. He married Appia Annia Atilia Regilla Caucidia Tertulla, who came from a patrician Roman family with consuls on both her father's and her mother's side. In fact, her paternal and maternal grandfathers were joint *consules ordinarii* in AD 108. Although this marriage signified Herodes' acceptance as a member of the Roman aristocracy, his life as a husband and as a father was less than happy. Of his several children only the one he liked least, his son Bradua, probably the *consul ordinarius* of AD 185, survived him. When his wife Regilla died in premature labour, due, it was said by many, to a kick administered by one of her husband's freedmen, Herodes had to stand trial for murder on the charge of having ordered this assault. Although he was acquitted, the mere fact that so monstrous a charge could be readily believed implies a less than harmonious married life.

Herodes died at the age of 76, between AD 177 and 179, after a reconciliation with his fellow Athenians with whom he had had stormy relationships for most of his life. He received honorary burial in one of his most splendid gifts to Athens, the Panathenaic stadium.

There is no adequate biography of Herodes Atticus in English, though there is in German (Ameling) and an older one in French (Graindor). Philostratus's life of Herodes is translated in the Loeb edition (W.C. Wright), and is the subject of a detailed commentary by the present author. Albini has produced an (Italian) edition of the speech *Peri Politeias*, though he is unconvinced that it is by Herodes as some scholars believe. Herodes' monumental remains are discussed most fully by Tobin.

IVARS AVOTINS

Biography

Born in Athens *c.*AD 101, Herodes was the son of a Roman senator and followed his father into a political career, becoming consul in AD 143. Educated by many of the best teachers of Greek and Roman culture, Herodes remained entirely Greek in his cultural outlook. He endowed many buildings in Greek cities and was a major representative of the Second Sophistic movement, though most of his works are lost. He died *c.*177.

Herodotus 484–*c.*425 BC

Historian

Herodotus' name is inseparable from that of his one surviving work, the *Histories*, an account of the Persian Wars (490–479 BC), fought between the Persian kings Darius and Xerxes and the cities of Greece and – very broadly defined – of the background to those wars. Though previous works, now surviving only in fragments, such as the *Genealogies* and *Journey round the Earth* of Hecataeus of Miletus, seem in some respects to have been similar in style and approach to the *Histories*, Herodotus has been recognized since antiquity as the "Father of History".

Our knowledge of Herodotus' own life largely derives from the internal evidence of his work. He was born in Halicarnassus (modern Bodrum on the southwest coast of Turkey) at some point in the first half of the 5th century BC, but left as a consequence of a period of political infighting in which his family was involved. The extent of his travels is hotly disputed. Herodotus claims to have travelled to Egypt, the Levant, and the Black Sea, but some aspects of his accounts of foreign lands – his description of unknown (or his omission of well-known) monuments, his ascription of very Greek-sounding ideas to foreign sources, and a number of fanciful details – have led many to suppose that his knowledge of foreign lands was more second-hand, the product not of personal investigation but of Greek tradition (or, less plausibly, of his imagination). At the very least it seems certain that Herodotus spent time in Samos and in Athens, both cities on which he is well informed; he is reputed to have died in the recently founded Greek colony of Thurii in southern Italy, or in Macedonia. References in his work suggest that he wrote in the early years of the Peloponnesian War (431–404 BC): the tension between Athens and Sparta, the two chief protagonists of that war, is a regular undercurrent in his account of earlier events. Possible allusions to his *Histories* in the comedies of Aristophanes, most notably the *Acharnians* and *Birds*, suggest that the work may have been "published" in a number of instalments.

Herodotus' declared object was to record the "great and marvellous deeds of Greeks and Barbarians" and in particular "the reasons why they went to war with one another". Only the last four of the nine books of his *Histories* describe the events of the Persian Wars; Herodotus' focus is much broader. His *Histories* are the chief source for the early history of Greece (from *c.*650 BC to the Persian Wars). At the same time, while tracing the expansion of the Persian empire into Asia Minor, Europe, and Egypt, Herodotus takes the opportunity to describe the customs of all those peoples in the Persians' path. These accounts are written in the present tense, as if the characters of the different peoples were timeless. They cover religious customs, sexual practices, dress, language, hairstyles, and any other "wonderful but true" stories Herodotus thinks fit to include.

The structure of the *Histories* can at first be bewildering. As he declares at one point, it is his intention to "digress" from the main course of his narrative. One such digression – on the history and customs of Egypt – takes up the whole of the lengthy second book. Nevertheless, as recent work has demonstrated, there are a number of underlying patterns to the work that are not initially evident. The search of the Lydian king Croesus for a Greek ally with whom to counter the Persian Cyrus leads Herodotus in book 1 to investigate the relative strengths of Athens and Sparta: the two cities are repeatedly juxtaposed. The close of the *Histories* used to be thought impossibly inconclusive. A number of echoes of the opening of the work reveal, however, a very polished and final ending – albeit one without any of the explicit historical conclusions that modern readers are led to expect. The last main episode of the *Histories* concerns the execution, on a site overlooking the Hellespont, of a Persian commander, Artacytes, for plundering the shrine of the hero Protesilaus. Protesilaus had been the first Greek to cross to Asia, and to die there, in the course of the Trojan Wars. In Artacytes' view, however, Protesilaus had in turn plundered his wealth from the king of Persia; for the Persians, Herodotus explains – recalling a Persian explanation of the earlier hostilities between Asia and Europe at the opening of the *Histories* – believe all of Asia to belong to their king. At the same time, the barbaric manner of Artaycтes' punishment – he was nailed to a plank, his son stoned to death before his eyes – points forward to another dangerously expansionist power: the man responsible, the Athenian commander Xanthippus, was the father of Pericles, the figure most associated with Athens' subsequent empire. It has happened before, Herodotus seems to be saying; it will happen again.

The *Histories* are also a rich source of evidence for Greek attitudes and values. Most markedly, Herodotus' work is characterized by strong religious convictions: by beliefs, for example, in the likelihood of divine retribution for unjust acts or in the value of divination, by a pronounced fatalism, and by a sense – expounded most fully by the Athenian character Solon in book 1 – of the unpredictability of all human fortune. At the same time, by acknowledging the possibility, for example, of others' scepticism over divination, Herodotus frequently reflects, even if he does not follow, more sceptical currents of thought. The language and style of his argumentation also find numerous parallels in contemporary medical

writings. Though his accounts of foreign peoples are moulded and structured by Greek attitudes and prejudices, Herodotus consequently provides invaluable evidence for the ways in which the Greeks perceived and understood their "barbarian" neighbours. Egyptian customs, for example, frequently mirror those of the Greeks: Egyptian women urinate in standing position and men sitting down. And the geography of Africa also inverts that of Europe: the course of the Danube provides evidence for that of the Nile.

If the allusions to Herodotus' work in the plays of Aristophanes (or of Sophocles) are accepted, this would suggest that his work quickly became well known to a large audience, at least in Athens. Later, unreliable anecdotes of public readings in Athens and at Olympia give the same impression, though they may simply be the product of a later perception of his work as populist. Thucydides, the Athenian historian of the Peloponnesian War, on a number of occasions takes for granted knowledge of Herodotus' work; by extending his *History* back to the aftermath of the Persian Wars, he may have seen himself as a continuator of Herodotus. In many ways, however – by his exclusion of the divine from history, by his more focused scope on the contemporary political and military affairs of Greece, and by pronouncements of his omission of *to mythodes* or "the fabulous" from his work – he may have meant to distance himself from his predecessor.

Herodotus continued to be read throughout antiquity. His influence can be detected on the 4th-century BC historians Ephorus and Theopompus – who wrote an epitome of the *Histories* – and also on Callisthenes. Nearchus, Alexander's admiral, seems to have travelled and written with Herodotus' stories in mind. In the Hellenistic period also Herodotus was mined for factual information by philosophers and by poets such as Apollonius Rhodius and Callimachus as well as by historians; he was commemorated by statues in Halicarnassus and in the library of the kings of Pergamum. His reputation was double-edged, however. Dionysius of Halicarnassus praised him as a stylist rather than as a historian. Others, from Ctesias – himself notoriously unreliable – in the 4th century BC onwards, denounced him as a liar or story-teller. A number of pamphlets, most famously Plutarch's *On the Malignity of Herodotus*, criticized him for lies, plagiarism, for bias against particular Greek states, or as a "barbarian-lover". Just as the expansion of Greek interest in the Near East that followed the conquests of Alexander the Great seems to have given his reputation fresh impetus, later events also gave Herodotus new prominence. His attempts to come to terms with the customs of foreign peoples became more relevant with the discovery of the New World. In the light of the long struggle of the Byzantine empire against the Ottomans, the confrontation of Greeks and Persians also acquired particular potency, as is reflected in the work of the historian Laonikos Chalkokondyles.

THOMAS HARRISON

Biography

Born in Halicarnassus, traditionally in 484 BC, Herodotus travelled widely, but perhaps not as widely as he would have his readers believe. He certainly spent time in Samos and Athens, and he is said to have died at Thurii in south Italy *c.*425 BC. His one surviving work, the *Histories*, is primarily concerned with the Persian Wars. But his description of the expansion of the Persian empire into Asia Minor, Europe, and Egypt leads him to describe the habits and customs of the peoples they encountered. Traditionally regarded since antiquity as the "Father of History".

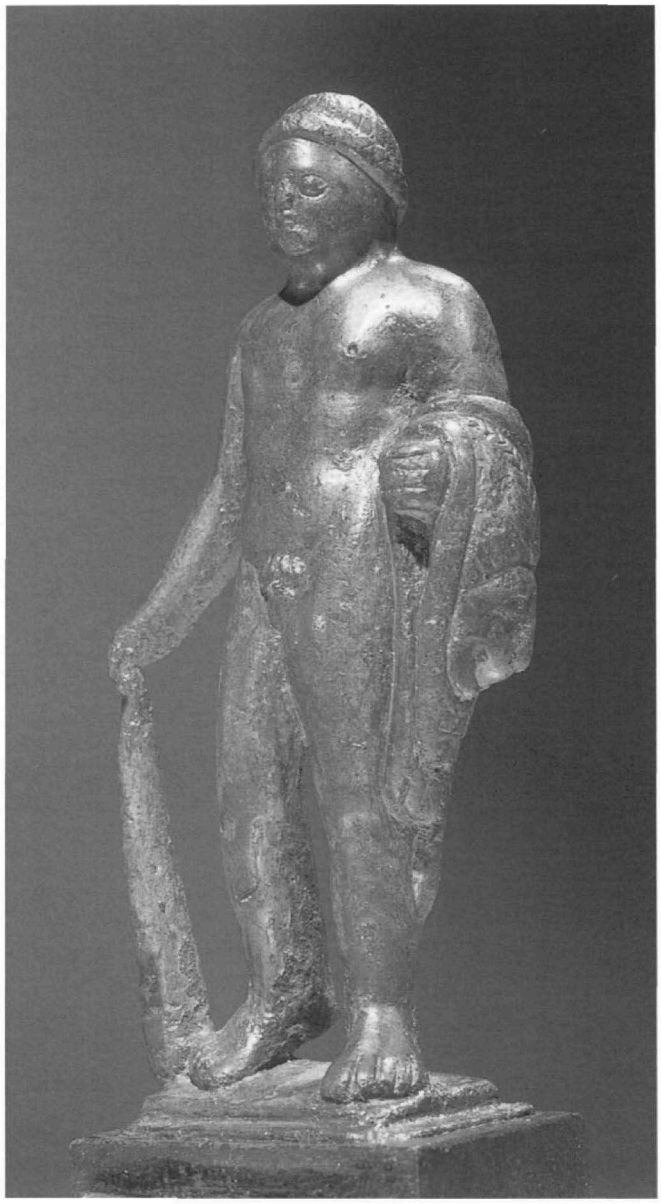
Heroes and heroines

In the Homeric poems the word *heros* designates a living warrior or another individual of high social standing. It is clearly a term of respect and attaches to groups of warriors such as the Achaeans and Danaans, as well as to individuals such as Protesilaus and Menelaus in the *Iliad*, and to the poet Demodocus and the young Telemachus in the *Odyssey*. By contrast, in Greek cult the word *heros* (and later *heroine* or *heroissa*) refers to a person whose powers had been so remarkable in life that he or she was honoured in death as attaining a status between god and mortal. These cults of heroes were distinct from the family cult of the dead. The cult of heroes has been taken back to the Bronze Age, but archaeological



Heroes: bronze statuette of Heracles, holding his club and the Nemean lion skin, 5th–4th century BC

evidence for this distinctive cult of the dead begins to appear in the early 8th century BC – the age in which the Homeric poems were taking shape and being performed throughout the Greek world. A connection between the spread of the *Iliad* and *Odyssey* and the emergence of hero cults has often been asserted, as has a connection between hero cult and the rise of the polis. The heroes of the Homeric poems – Achilles, Agamemnon, Menelaus and Helen, Meriones and Diomedes, Odysseus and Alcinous – were recipients of a hero cult both in their native countries and throughout the Greek world. Many, such as Achilles and Agamemnon, were worshipped far from their native lands: Achilles was worshipped in the Troad and Black Sea and Agamemnon in Tarentum

This is remarkable, since it is axiomatic of the cult of heroes that these cults are tightly bound to a single place (usually a grave with its monuments) and are the expression of group identity. Although worship of heroes and heroines can reasonably be connected with the rise of the polis, the worship of the heroes of the Homeric epics, like the cult of Homer himself, is Panhellenic.

There was nothing like a cult of heroes in the ancient Near East, although Lycian dynasts adopted the cult in the 4th century BC. In the *Iliad* the descriptions of the cults of Erechtheus and Sarpedon have plausibly been taken as reflections of Homer's awareness of hero cult. But it is only in the myth of the ages in Hesiod's *Works and Days* that the race of heroes emerges as a distinct historical phenomenon. This race is inserted in the succession of metallic ages known from the Book of Daniel (gold, silver, bronze, and iron). Coming after the age of bronze, the heroes and "half-gods" (*hemitheoi*) who fought at Thebes and Troy are recognized as receiving honours from the gods in death by being transported to the Islands of the Blest. But it is the men of the silver age who, dwelling beneath the earth, receive honours in death, even though they neglected the gods.

The archaeological record of a hero cult derives from the deposits at the graves and grave precincts of the dead who were recipients of the cult, and from a variety of representations of the dead as the objects of worship by the living human community. Most of these cults are anonymous. The most striking early example of such a cult is the 7th-century BC *heroon* (hero shrine) of a warrior buried with rich grave offerings in the grave complex at the west gate of Eretria in Euboea. There are later reliefs from Laconia showing the heroized dead (both male and female) seated majestically on thrones, with snakes coiling about to indicate their chthonic character as heroes. More common and dating from the late 6th century BC are the reliefs (known as banquet reliefs) that show a male *heros* reclining on a banquet couch with a *phiale* (libation bowl) or *rhyton* (drinking horn) in hand to receive the libations of the living. Such a figure is associated with a seated figure representing his wife. On the upper register of the relief are the emblems of his life: these include his weapons and sometimes his horse looking in through a window in the "wall". Below the couch is a table holding offerings of bread, fruit, and eggs. These are all aristocratic monuments and dedications in a sanctuary rather than grave monuments. Very occasionally dedications with inscriptions have been excavated in these grave precincts: at Mycenae one vase is dedicated "to the hero", another "to Helen", and a stele "to Menelaus" in Sparta.

Heracles was the archetype of the Greek hero. He was half divine and half human, with Zeus as his father and Alcmene as his mother. Herodotus reports that on the island of Thasos, where he had an important sanctuary, he received sacrifices both as an immortal and as a mortal. The one kind of sacrifice was performed on an altar and included libations, as well as the table companionship of the worshippers; the other kind of sacrifice was a holocaust and was deposited, with libations, in a pit (*bothros*, *eschara*); it did not involve the table fellowship of the worshippers. In the 5th century BC the worship of *heroinai* came into prominence, especially in Attica. These heroines were anonymous but they are clearly conceived of as the ancestors of the worshippers. Women did not share in what are usually counted as the four main categories of hero cult: that of the statesman, the warrior, the athlete, and the poet. Lycurgus and Chilon had their cult at Sparta; Brasidas, the Spartan general, at Amphipolis; the savage athlete Cleomedes

at Astypalaea; and Archilochus had his cult on Paros. The cult of Archilochus on Paros had a history of some 800 years, and the cults of Homer throughout the Greek world were about as durable. Philosophers were also honoured by hero cults. The first cult to a philosopher we know of was Parmenides' dedication of a *heroon* to his teacher, Ameinias, in Velium (south of Naples). Cults are recorded for Pythagoras and Plato, as well as for Epicurus and his associates. These cults helped to create a sense of group identity for the members of these philosophical schools (who were most often foreigners) and gave them a kind of corporate identity.

The rise of the polis and the weakening of the grip of the great families within the Greek city state are reciprocal phenomena. The hero cult became civic and, as it did, the family cult and tending of the dead became less important, although elaborate funerary monuments persisted. Rivalling both cults was the new cult of the ruler. The cult of a living ruler emerged well before the Hellenistic age. In the early 4th century BC the Spartan general Lysander received worship on Samos, as did Antigonus II and Demetrius Poliorcetes in Athens early in the next century. With Alexander of Macedon's arrogation to himself of divine status, the cult of rulers began to rival the cult of the gods, especially in the successor kingdoms of the Ptolemies, Attalids, and Seleucids in Egypt, Asia Minor, and the east. The coinage of these states is eloquent. Where coins once showed the emblem of the city and its most important divinity (in the case of Athens the owl and Athena), the coins of Alexander and his successors displayed the portrait of the dynast as equal to the divinity of the city issuing the coin. Associated with these cults of the living ruler were sacrifices, processions, contests, and priesthoods. These paved the way for the cult of the Roman emperor and Roma in the Roman imperial period, but they were short lived and rarely survived the death of the ruler and the emergence to power of his successor.

Neither the rise of the polis nor the partial eclipse of its autonomy in the Hellenistic age arrested the continuity of the family cult and, as the franchise on heroic status became cheap, a family could declare on a small grave block or stele that this was the resting place of "Sostratos, *heros*". The term *heros*, once honorific, was demoted to the status of the term *makarites* in modern Greek – *heros*, like "blessed", simply came to mean "departed". Some families were wealthy and more ambitious. On the island of Thera in the late 3rd century BC an elaborate inscription describes the development of the cult that Epicteta established for her husband and her two sons who had predeceased her and, looking beyond her own death, herself. This will was ratified by the ephorate of the island and thus the private became public.

In her will Epicteta spoke of the precinct that was the centre of her cult as a *mouseion* (or place sacred to the Muses) and the individual graves as *heroa*, that is, monuments to heroes. The place of worship of heroes was often named after them: there is an Archilocheion on Paros and Homereia are known from Smyrna (where Homer was honoured with a temple and library), Chios, and Alexandria. The architectural remains of such *heroa* range from a grave and precinct to the Mausoleum of Mausolus of Caria (erected by his wife after his death in 353 BC), which was one of the wonders of the ancient world and most probably the centre of a hero cult. The Greek practice of heroizing the dead also spread to Lycia, where the grave of the local dynast Erbinna is contained in the magnificent 4th-century BC Nereid monument (now in the British Museum). The great altar to Zeus at Pergamum probably also functioned as a *heroon* to the ancestral figure of Telephus. The heroic pretensions of the anonymous *heros* buried in an elaborate temple tomb in Calydon are clear from its iconography and the relief showing the local hero Meleager.

With the spread of Christianity, pagan forms of worship – including hero cult – were gradually suppressed. But some pagan temples were converted into early Christian churches, as the Parthenon was given over to the worship of the Virgin (Panaghia). Christian saints supplanted the heroes who had prepared the way for them and, like the heroes and heroines of the past, they had their own place of cult, the centre of their power, and their days on the calendar of the religious year.

Heron

Mathematician and astronomer of the 1st or 2nd century AD

Very little is known about Heron of Alexandria, and we cannot even be sure when he lived (dates from the 2nd century BC to the 3rd century AD have been suggested). He does, however,

seem to be aware of the Romans, and in one of his works an argument uses as an illustration an eclipse of the moon observable in both Rome and Alexandria ten days before the spring equinox. The only such eclipse that took place in the range of periods in which Heron might have lived was in AD 62 (on 10 March). Since there is also some indication that the astronomer Ptolemy, writing in the 2nd century AD, was familiar with more sophisticated mathematical methods than those of Heron, then a date in the late 1st or early 2nd century AD looks plausible.

Heron is the author of 11 surviving treatises, largely on the practical applications of mathematics and mechanics. As practical handbooks they seem to have been modified and partially rewritten in the course of time to meet the needs of later users, and in some cases there are doubts as to how much really goes back to Heron.

The *Metrica* deals with methods of calculating areas and volumes; the *Definitions* is a collection of geometrical terms, and is probably a Byzantine compilation; the *Catoptrica* (which survives only in a medieval Latin translation) is on the mathematics of mirrors and their practical use; the *Geometrica* is a rather unstructured introduction to geometry; the *Stereometrica* deals with the theory of measuring volumes, and goes on to describe its practical application; the *Belopoieca* and the *Cheiroballistra* describe the construction of different kinds of catapult; the *Dioptra* concerns surveying, and particularly the use of the plane table; the *Mechanica* (which survives only in Arabic translation, though substantial fragments of the Greek text are preserved by Pappus) starts with simple theoretical mechanics, and goes on to describe mechanical devices such as the windlass, the lever, the screw, and the pulley, and shows how they can be used to move heavy weights; the *Automatopoietike* is about the construction of automata (largely for entertainment); and the *Pneumatica* describes devices worked by compressed air, steam, and water. A number of other works are credited to Heron, including a commentary on Euclid's *Elements*, of which a few fragments are preserved in quotations by other authors.

Although some of Heron's works contain mathematical material in the same form, and with the same goals, as traditional Euclidean geometry, what is interesting is that he reveals that Greek mathematics was not restricted to those fields in which they were capable of devising formal proofs. He also shows how Greek mathematics could be adapted to practical use. Many procedures are carried out by the application of formulae, as they are today. He knows the formula for calculating the area of a triangle if the length of the sides is given, and another for approximately calculating a cube root, and his method of solving quadratic equations is very close to the one used today. While mathematics in the Euclidean tradition is interested in producing irrefutable proofs, and absolute precision and certainty, Heron does not hesitate to give approximate results, of a kind perfectly adequate for practical purposes. It is very much the kind of mathematics that had long been practised by the Babylonians and the Egyptians, and shows that this tradition of practical mathematics continued to develop among the Greeks alongside the Euclidean tradition that we think of as more characteristically Greek. Heron often illustrates his procedures by examples drawn from real practical situations, such as calculating the capacity of a theatre, a barrel, a well, or the hold of a ship.

He is, however, best known for his descriptions of machines, gadgets, and automata, which preserve some of the few pieces of evidence we have of the application of Greek science to practical technology. He provides, for example, one of the few instances from antiquity of harnessing the power of the wind by means of a windmill; in the example he gives, it is used to drive a mechanical organ. He describes a crude steam turbine in which steam created by boiling water in a cauldron is piped into a ball through tubes on which the ball is pivoted, and allowed to escape through outlets that drive the ball round; he also gives an account of a force pump for use in a fire engine. Many of the machines he describes are designed to amuse or impress. For example, he tells us how to construct a vessel that will, by the manipulation of air inlets, dispense pure wine, wine mixed with water, or plain water (which Heron thinks might be a good joke to play). He describes two different ways of making a model temple whose doors will open of their own accord when a fire is lit on the altar, and another device makes a trumpet sound when a door is opened. He also describes a vending machine that dispenses water (presumably for purification purposes) when a coin is inserted, and gives an account of how to build toy theatres, where the figures are made to move by the force of millet seed or sand trickling out of a container.

It is hard to say how many of these devices were ever actually built or put into use (though some of Heron's descriptions do seem to bear the marks of practical experience). The argument sometimes put forward that Heron's work demonstrates that industrialization was well within the grasp of Greek engineers, but that they were prevented from progressing by social or ideological considerations, is quite misplaced. In most cases, the technology of the day was not sufficiently advanced to enable the construction of more than very small devices. In the case of the steam turbine, which is often cited in this argument, the form in which Heron describes it could hardly have had a practical application. The weak point of the device is the joint between the steam pipes and the ball, which must be tight enough to prevent steam escaping, but loose enough to allow the unimpeded movement of the ball. It has been calculated that the efficiency of such a machine would be no more than 1 per cent; consequently, the effort required to gather fuel and stoke the boiler would be many times greater than any work produced.

Biography

Heron was born in Alexandria but little else is known of his life. He may have lived in the 1st or 2nd century AD. He wrote widely on mathematics and the practical applications of mathematics, notably machines, gadgets, and automata. He drew on Babylonian sources as well as the Euclidian tradition.

Herophilus *c.*330–*c.*260 BC

Physician

Herophilus of Chalcedon, an Alexandrian physician, was one of only two ancient scientists (the other being Erasistratus of Ceos) to perform systematic scientific dissections of human cadavers. According to controversial but plausible ancient evidence, he and Erasistratus also performed vivisections on condemned criminals handed over to them by autocratic Hellenistic rulers. Herophilus' pioneering use of human dissection led to numerous remarkable anatomical discoveries, among them his discovery of the nerves, his distinction between sensory and "voluntary" (i.e. motor) nerves, and his description of the paths and functions of at least seven pairs of cranial nerves, including the optic nerve and the oculomotor nerve. He also identified several ventricles of the brain as well as some fine cerebral and vascular structures. Discovering a cavity in the floor of the fourth ventricle of the brain, he named it *kalamos* ("reed pen") because of its resemblance to the carved-out groove of a writing pen. This is but one of his many contributions to modern anatomical nomenclature (*calamus scriptorius*). The confluence of the four great cranial sinuses still bears the name of its discoverer: *torcular Herophili*. His meticulous dissection of the eye also allowed him to become the first to distinguish between the cornea, retina, iris, and chorioid coat.

Herophilus' anatomical investigations yielded considerable advances in the description and understanding of other organs too. An extant fragment from book 1 of his *Dissections*, for example, preserves the first reasonably accurate and detailed description of the human liver, while fragments of book 3 preserve his anatomical account of the male and female reproductive parts. Using the analogy of the male testicles, he discovered the ovaries or, as he called them, female "twins" (*didymoi*, "twins", being a traditional term for the testicles). His investigation of the uterus and of the ovaries also led to his discovery of the Fallopian tubes, although (as Galen was delighted to emphasize) Herophilus failed to recognize their true course and their function. From book 4 of *Dissections* fragments of his extensive anatomy of the vascular system survive, including some concerning the anatomical distinction between veins and arteries, the heart valves, the chambers of the heart, and various complex vascular structures.

Closely linked to Herophilus' radically new anatomical version of the human body was his physiological model of the body. The aim of his dissections and vivisections of humans and animals apparently was not only to *describe* various internal parts of the body, but also to uncover and explain their *functions*. Although insisting that all causal explanation is "hypothetical" or provisional, he freely offered causal accounts of respiration, pulsation, sensation, reproduction, dreams, and physical as well as mental diseases. Locating the "command centre" (*hegemonikon*) of the body in the fourth cerebral ventricle, i.e. in the cerebellum (which is in fact responsible, *inter alia*, for muscular coordination and for the maintenance of physical equilibrium), Herophilus apparently argued that neural transmissions occur by means of *pneuma*, a breath-like substance that runs from the brain through the nerves. This *pneuma* is ultimately derived from the external air through respiration.

Pneuma is present not only in the nerves, according to Herophilus, but also in the arteries, mixed with blood, whereas the veins carry only blood. This uncanny, though not precise, parallel to the modern recognition that the arteries carry oxygenated blood ("blood with *pneuma*" in Herophilus' model) from the heart, whereas the veins convey deoxygenated blood ("blood without *pneuma*", according to Herophilus) triggered a controversy that lasted many centuries, but in the end it was Herophilus' view that prevailed, not least because the influential Galen accepted it, albeit with certain elaborations.

Herophilus' pioneering treatise *On Pulses* became the foundation of practically all ancient pulse theories, as becomes evident in Galen's voluminous accounts of pulse lore. A "power" or "faculty" (*dynamis*) flowing from the heart through the muscular walls of the arteries causes the regular dilation and contraction of the arteries; the words "diastole" and "systole" are further examples of Herophilus' many enduring contributions to medical terminology. The pulsating arteries continuously "pull" the mixture of blood and *pneuma* from the heart, and distribute it to all parts of the body. Using musical analogies, Herophilus described the changing relations between *diastole* and *systole* at different stages of life as successively displaying pyrrhic, trochaic, spondaic, and iambic rhythms, i.e. in infancy, childhood, adulthood, and old age, respectively. So confident was he in the diagnostic value of the pulse that he constructed a clepsydra, adjustable for the patient's age, to measure his patients' pulse rates.

In his *Midwifery* Herophilus apparently tried to demystify the uterus by asserting that not only is it constituted of the same material elements as the rest of the body but it is also governed by the same "powers" or "faculties". Certain "affections", he said, are of course experienced only by women (conception, parturition, lactation), but there is no disease peculiar to women. His discovery of the broad ligaments, which hold the uterus in place, challenged the traditional Hippocratic theory that hysteria or hysterical suffocation is caused by the "wandering womb". The causes of difficult childbirth, the normal duration of pregnancy, the benefits and disadvantages of menstruation, and whether the foetus is a living being are further subjects treated in this work. Tertullian, who vigorously objected to Herophilus' use of human dissection and vivisection, also charges Herophilus with the possession of an instrument known as "foetus-slayer", implying that he performed abortions.

His semiotic theory of diagnosis, known as a "triple-timed inference from signs", his descriptions of the symptoms and causes of numerous physical and mental disorders, and his classification of dreams are among further achievements that

provoked both admiring approval and resistance throughout antiquity.

Herophilus' revolutionary discoveries transformed Greek theoretical medicine, but it is difficult to assess their influence on ancient and Byzantine medical practice. Furthermore, resistance to his innovative methods, notably to human dissection, was immediate and forceful. Moral and religious scruples about dissection found a powerful ally in the methodological and epistemological objections of the Empiricists, a new medical "school" founded in Alexandria by Philinus of Cos, a renegade pupil of Herophilus. Although Herophilus had his followers, too – the history of the "Herophilean school" can be traced in Alexandria, Asia Minor, and elsewhere from the 3rd century BC to the 1st century AD – they never seem to have mounted an effective defence of human dissection against the Empiricists' claim that it is a clinically irrelevant and epistemologically suspect method of investigation. Herophilus' discoveries and theories nevertheless continued to have an impact, in large measure thanks to their transmission by an appreciative though not uncritical Galen, by Soranus of Ephesus, by early Byzantine medical encyclopaedists (Oribasius, Aëtius of Amida, Paul of Aegina), and by Hippocratic and Galenic commentators. When systematic human dissection was resumed in the Renaissance, the superior accuracy of Herophilus' observations was recognized anew. In the 20th century, too, innovative theorists have continued to recognize the value of some of Herophilus' insights, even if, in certain cases, reluctantly. In *The Interpretation of Dreams*, for example, Sigmund Freud comments: "I am far from seeking to maintain that I am the first writer to have the idea of deriving dreams from wishes. Those who attach importance to anticipations of this kind may go back to Classical antiquity and quote Herophilus."

Biography

Born in Chalcedon *c.*330 BC, Herophilus was a pupil of Praxagoras of Cos before moving to Alexandria. There he performed systematic dissections of human cadavers (and, according to some sources, vivisections on condemned criminals) which led to many important anatomical discoveries and transformed theoretical medicine. His writings included the treatises *Dissections*, *On Pulses*, and *On Midwifery*. He died *c.*260 BC.

Hesiod

Epic poet of the 8th or 7th century BC

The works of Hesiod, like those of Homer, deal with two disparate themes. Unlike the *Iliad* and *Odyssey*, however, which are long narratives composed to entertain, Hesiod's *Theogony* and *Works and Days* are shorter poems, instructive in their purpose. They are best understood within the framework of traditions of cosmogonical and wisdom literature prevalent in the ancient Near East (although not only there).

The *Theogony*, which seems to have been composed first (see below), deals with the creation of the universe and its peopling with gods in their generations and their semidivine offspring. After an opening hymn to the Muses and an invocation, the poet goes through divine genealogies from Chaos to the Olympians, the narrative being underpinned by the separate episodes of the divine succession myth, wherein Uranus gives way to Cronus, and Cronus and the Titans to Zeus. The poem ends – or peters out – with a catalogue of the children of goddesses and mortal men, which is closer to the later catalogue of mortal women who lay with gods than to the genuine poetry of Hesiod. Both the creation and succession myths of the *Theogony* have close parallels in oriental mythology.

After a brief introduction, most of the *Works and Days* is cast in the form of an admonition to the poet's unsatisfactory younger brother Perses. Hesiod then tells a story of Prometheus, whose deception of Zeus (over the allocation of shares in animal sacrifice, and the theft of fire, which he gave to mankind), which earned Prometheus agonizing punishment, is described at length in the *Theogony*. Here the earlier story is briefly alluded to, and its sequel is told: in revenge for the theft of fire, Zeus creates Pandora, whom he gives to Prometheus' late-thinking brother Epimetheus, with disastrous results, namely the release of evils upon mankind. The poet is then reminded of another story that traces in a different way the degradation of the human condition. This is the myth of ages, gold–silver–bronze–iron, with the insertion between the last two of the age of heroes who fought at Thebes and Troy. Hesiod then addresses the *basileis*, the chieftains whom Perses appears to have suborned, and Perses. In the bulk of the rest of the poem he gives Perses – who seems somehow to have lost his fortune and to be in need of practical instruction – advice on the agricultural tasks appropriate to each season of the year. A section on domestic and social matters follows, and the poem concludes with an almanac of the days of the month (the "Days" of the title). The motifs of giving advice to a younger person, and the myth of ages, have parallels with eastern literature, but, as with the traditional elements in the *Theogony*, it is not possible to trace any kind of line of descent. It is to be noted as well that, despite the differences in scope and subject matter, Hesiod and Homer both composed in the same artificial epic dialect, which seems to have originated in Aeolis and Ionia, and clearly belong to the same epic tradition.

Hesiod differs from Homer not only in the nature and scope of his work, but also in the way that he presents himself to his audience. Whereas Homer is self-effacing to the point of anonymity, Hesiod goes to great pains to present and identify himself as a man with a name and occupation of his own, living in a specific milieu and with a specific background. How

Hesiod: carved gemstone showing Prometheus fashioning man in the image of the gods as described in Hesiod's *Theogony*, 3rd–2nd century BC, British Museum, London

much of this is genuine, and how much convention, is difficult to say, but where the details he gives can be checked they seem to confirm his story. For example, he claims to live at Ascra, near Mount Helicon. The site has been identified, and his description of the local microclimate is valid even today. He says that his father came from Cyme in Aeolis to settle at Ascra, understandable enough in that he would have moved from one Aeolic-speaking place to another.

The relative dates of Hesiod and Homer (whether he be poet or redactor) are still unsettled, but it seems to be generally agreed that their lifetimes overlapped, near the turn of the 8th and 7th centuries BC. In the *Works and Days* Hesiod reveals that he once won a tripod for a poem sung at the funeral games for Amphidamas of Chalcis: it is generally agreed that the prize poem was the *Theogony*. In both poems the poet speaks freely of himself and his circumstances. Other poems attributed to Hesiod – the *Shield of Heracles* and the various *Catalogues* – are generally, and probably correctly, held to be creations of various authors of the 6th century BC. Hesiod's position as an author within the genre is obfuscated by the fact that later ancient scholarship lumped together under his name all other catalogue poetry, as it attributed all other military epics to Homer.

The earliest critical edition of Hesiod's text was made by Zenodotus of Ephesus, the first librarian of Alexandria, followed by Aristophanes of Byzantium (3rd–2nd century BC) and Aristarchus (2nd century BC). These and other Alexandrian scholars more or less established the text (and several of its recurrent problems, such as the authenticity of the last part of the *Works and Days*, and of the lesser poems). Substantial commentaries were written by Plutarch (1st–2nd century AD), Proclus (5th century AD), John Tzetzes (12th century), Planoudes (13th century), Moschopoulos (13th–14th centuries), and Triklinios (14th century).

Understandably, Hesiod has not had as much influence on later literature as Homer. His work was, however, well known in antiquity, both in Greece and in Rome. Closer to our own time, George Chapman translated the *Works and Days* (1618), and Milton drew on the *Theogony* for the Creation portion of *Paradise Lost* (1667). Hesiod's Heliconian Muses have, of course, become a symbol for poetic inspiration, and poets from antiquity to the present have used the authority of Hesiod to speak of themselves and their poetic vocation. In the 20th century Kostis Palamas identified himself with Hesiod in his "Man of Ascra" (1903–04), a poem of 666 lines, in which he extends Hesiod's five ages to include a sixth, an Age of Love (retelling the Pandora myth), and adds a motif of his own, of rebirth after death, a metaphor for the rebirth in modern Greece of its ancient heritage.

ALBERT SCHACHTER

Biography

An approximate contemporary of Homer, Hesiod (*fl. c.*700 BC) lived at Ascra in Boeotia where his father had settled after leaving Asia Minor. He is the author of two surviving epic poems, the *Theogony* (on the descent of the gods) and the *Works and Days* (on agriculture and the just life). Other poems have been falsely attributed to him.

Hesychasm

Hesychasm is now generally associated with the theology of St Gregory Palamas, worked out in the course of the 14th-century hesychast controversy. Gregory was, however, working on the

basis of a tradition that had experienced a certain renaissance from the late-13th century and which was rooted in the very origins of monasticism.

The word "hesychasm" derives from *hesychia* or stillness, tranquillity. The origin of this word is uncertain, though it has been linked to the verb "to be seated". It occurs in Classical Greek to signify both exterior and inner calm and peace. The Septuagint uses it principally to refer to the tranquillity resulting from freedom from external threats, but also in the sense of keeping silence. This second sense also crops up in the Greek of the New Testament, albeit rarely.

The *Apophthegmata Patrum* (5th–6th centuries) speak of *hesychia* not just in terms of the flight from men but also in terms of inner tranquillity. The term "hesychast" came to designate one seeking inner and outer stillness, not necessarily one who lived in complete solitude, but often one who lived in the kind of semi-eremitic communities found at Scetis or Nitria. Hesychasm, of both kinds, is recommended by many writers of the patristic period.

The most complete development of hesychasm as a distinctive spiritual tradition is found in the Sinaitic tradition, most especially in the work of St John Klimakos (7th century). "Few are those", he writes, "who have excelled in profane philosophy! Fewer still, I might say, are those who truly know that wisdom which is *hesychia*!" *Hesychia*, for Klimakos, is a state of inner silence and watchfulness, intimately linked to the remembrance of Jesus and short, repeated prayers. "The hesychast is one who tries to circumscribe the incorporeal in his body: a paradoxical undertaking!" "*Hesychia* is perpetual adoration before God: may the remembrance of Jesus be united with your breath, and then you will know the worth of *hesychia*." It is easy to see how important Klimakos was to be for the hesychasts of the 14th century in defending their psycho-physical methods of prayer. Klimakos does not expressly refer to the Jesus prayer, though this is clearly recommended by Hesychios of Batos, or Sinai (?8th century), his spiritual successor.

The hesychast tradition has tended to fluctuate in its influence, experiencing regular periods of decline and revival. It broke out spectacularly in 11th-century Byzantium with the mystical teaching of St Symeon the New Theologian. After that it seems to have gone into decline. Theoliptos of Philadelphia (*c.*1250–1322) is singled out by St Gregory Palamas as one of the leading teachers of hesychasm. Nikephoros the Hesychast, a monk of Athos in the 13th century, gave an account of certain methods by which the thoughts might be restrained and the return into oneself, into the depths of the heart, be effected. His teaching is similar to that given in the *Three Methods of Prayer* falsely attributed to St Symeon the New Theologian. Both may simply be records of practices that had long been traditional on Athos. It was these sorts of methods, particularly as practised by inexperienced monks, that so incensed the Calabrian monk Barlaam.

Notwithstanding the work of such men as Nikephoros, when St Gregory of Sinai arrived on Athos, around 1300, he found the practice of hesychasm virtually dead. Gregory settled at the skete of Magoula, near the monastery of Philotheou. While avoiding all controversy, Gregory's standpoint was very much that of his namesake, St Gregory Palamas. He speaks, for example, of the light of the Transfiguration as uncreated and specifically divine. In the course of the hesychast controversy Palamas provided a theological basis for the hesychast tradition of prayer, defending the participation of the body in the spiritual life and providing an explanation whereby the light witnessed in prayer could be regarded as divine and uncreated without negating the transcendence of God.

The victory of the hesychast party led by Palamas had enormous repercussions. It produced a flourishing of the hesychast tradition in the so-called Byzantine Commonwealth, a phenomenon described by John Meyendorff as the "hesychast international". It tended to confirm the monasticization of the patriarchate and the abandonment of the cathedral rite – both processes that had begun long before the hesychast controversy. The Turkish conquest appears to have severely restricted the hesychast tradition for some centuries. A deliberate attempt to revive it is to be found in the *Philokalia*, compiled in the 18th century by St Nikodemos of the Holy Mountain and St Makarios of Corinth. The influence of the *Philokalia* was initially more palpable in the Slavic world. There was a resurgence of the practice of the Jesus prayer in 19th-century Russia that owed much to the hesychast texts in the *Philokalia*. In the 20th century there has been something of a revival of the hesychast tradition on Mount Athos. This revival began in sketes such as that directed by Elder Joseph the Hesychast, and has since spread to many of the coenobia.

MARCUS PLESTED

Summary

Hesychasm, which derives from *hesychia* (stillness), is an aspect of the Eastern Christian spiritual tradition that goes back to the beginnings of monasticism. It is particularly associated with the thought of the 14th-century theologian St Gregory Palamas. The *Philokalia* includes many hesychast texts and the meditative tradition is currently enjoying a revival on Mount Athos.

Hetairists

Also known as the *Philiki Hetaireia*, the "Friendly Society" was a philhellenic secret society that consisted mostly of Greeks living abroad, with the goal of organizing and helping to finance a Greek uprising against the Turks. It was one of the main contributing factors to Greek nationalism in the second decade of the 19th century, and played an active role in setting the stage for the War of Independence.

Founded in Odessa in 1814 by the expatriate merchants Athanasios Tsakalov, Nikolaos Skoufas, and Emmanouil Xanthos, the *Philiki Hetaireia* was organized along the lines of other revolutionary secret societies such as the Freemasons and Carbonari, but also in the tradition of Greek intellectual and

literary clubs such as the Philomuse Society founded in Athens in 1812 for the purpose of the cultural regeneration of the Greek nation. The *Hetaireia* moved its headquarters to Constantinople in 1818, as its membership grew and became more cosmopolitan; by the time of its dissolution it included members from nearly every major Greek community in Europe, as well as most regions in Greece itself. It was dissolved in 1821, at the outbreak of the War of Independence, when its nominally democratic organization was superseded by the more traditional loyalties and values necessitated by warfare. Yet in his analysis of hetairist documents, George D. Frangos notes that even in 1821 the records of some 1000 documented members reveal 53.7 per cent merchants, 13.1 per cent professionals (such as teachers, students, physicians, secretaries, etc.), 9.5 per cent clergymen, 8.7 per cent military men, and only 0.6 per cent peasants, the group representing the largest percentage of population in Ottoman-occupied Greece.

Throughout the *Hetaireia*'s existence, members were sent as messengers to European communities where Greeks lived, and to leaders of the Greeks in the Ottoman empire, seeking financial contributions and new initiates into the society. A number of local cells were set up in Greek territory and the Danubian principalities, and certain Orthodox priests in Greece proper openly assisted them. The *Philiki Hetaireia* was especially attractive to Phanariots and others with western sympathies and education, but members also included leaders of the klephts, such as Theodore Kolokotronis; the ruler of the Maniots, Petrobey Mavromichalis; and even the opportunistic Ali Pasha, who hoped to manipulate the *Hetaireia*, and through it the Russian government, into aiding his own uprising against the Sublime Porte. Membership also included a few prominent non-Greeks such as Kavadjordje Petrovic, who had led a successful revolt against the Porte in Serbia in the years 1804–06.

Initiates were intentionally misled into believing that the society had the backing of Russia through Ioannis Kapodistria, who at that time was serving as the principal minister of tsar Alexander I. Kapodistria had in fact been invited at least twice to become the leader of the *Philiki Hetaireia*, but had refused. Barbara Jelavich suggests that possibly it was he who suggested Alexander Ypsilantis, who became the society's leader in 1820 and led the abortive attempt to begin the revolution in the Danubian principalities of Moldavia and Wallachia (modern Romania) in March 1821. The *Philiki Hetaireia* gained considerable support from both Greeks and Romanians in the form of money, weapons, and recruits who believed that they were acting with the tsar's approval. When word came through that the tsar had denounced the revolt and the *Hetaireia*, the Ottoman army easily defeated the rebels. Ypsilantis escaped across the Austrian frontier, but was captured by Austrian authorities and died in the dungeon of Mugats castle in January 1828. His brother, Demetrios Ypsilantis, was chosen by the *Hetaireia* to lead the revolt in Greece itself. Demetrios arrived at Hydra in June 1821, and enjoyed considerably more success on Greek soil than Alexander had in the principalities.

The *Philiki Hetaireia* combined the traditions of the Greek Orthodox Church and Greece's Classical history with a burgeoning nationalism. The society's initiation rituals were elaborate and arcane, requiring all members to become the blood brother of any other member they might chance to meet. Initiates learned the hetairist symbols and words, then were sworn into the society in the presence of a priest. After this a number of increasingly binding oaths and confessions were made in a secret place, in the name of justice, truth, and the fatherland, and in the name of the Father, the Son, and the Holy Spirit. New members were told almost nothing about the nature of the society's controlling organization, or about its members or activities at any levels above their own.

There were four civilian grades, with correspondingly simple or complicated oaths and responsibilities. The *vlamis* (from the Albanian *vlameria*, or "brotherhood") and *systimenos* (from the Greek root for "drawing together") levels were at the bottom, and the *ierevs* (priest) and *poimin* (shepherd) levels were reserved for wealthier and better- educated Greeks, who paid a higher subscription. The two military grades were *aphieromenos* (dedicated one) and *archigos ton aphieromenon* (leader of the dedicated). At the very top were the *archi*, the inner circle, whose membership was to be kept a strict secret until after the revolution had actually been put in motion.

Although this last measure was taken to protect the personal safety of the *archigoi* ("leaders"), such secretiveness about the society's actual leadership had the additional effect of raising speculation that various well-known and powerful political figures – including Kapodistria and the patriarch Gregory V of Constantinople, the civil and religious leader of the Greeks – were involved, thus increasing membership and interest in the cause. The patriarch was not a member, and had actually denounced and excommunicated Alexander Ypsilantis after the invasion of the Danubian provinces. Nevertheless, he was executed by the Porte on Easter Sunday, 22 April 1821, for allegedly acting as an accessory to the rebellious activities of the *Philiki Hetaireia*. This event, which horrified all Christendom, resulted in widespread support for the revolution, both within Greece and abroad.

Summary

The hetairists were members of the *Philiki Hetaireia* (or "Friendly Society") whose object was to foster a Greek uprising against the Turks. It was founded in Odessa in 1814 and moved to Constantinople in 1818. It provided links between Greek communities throughout Europe and the Ottoman empire and played a significant role in instigating the War of Independence. It was dissolved in 1821.

Hieron I

Tyrant of Syracuse *fl.* 478–466 BC

In 480 BC, two years before Hieron I succeeded his brother Gelon as tyrant of Syracuse, the city's position as a major power among the western Greeks was confirmed by the decisive victory of the combined forces of Gelon and Theron of Acragas over the Carthaginians at Himera. The resulting security was one of the major factors that enabled Hieron to extend his power and to establish a court famed – not least because it was the poets' job to praise him and his followers – as a centre of artistic patronage.

Hieron had already exercised authority since 485 BC as governor for his brother of Gela, their ancestral home. In Syracuse he consolidated the alliance with Acragas by marrying Theon's niece. (The link had temporarily been threatened, early in the reign, when his disgruntled brother Polyzalus, now governing Gela, attempted to form an alliance with Theron against him.) Outside Sicily, he soon laid claim to larger Panhellenic power or at least prestige. In 477 BC he was able effectively to order Anaxilas, ruler of Rhegium and Messana, not to attack Locri Epizephyrii. (Anaxilas had already been pressurized after Himera into abandoning relations with Carthage and marrying his daughter to Hieron.) In 474 BC he helped Cumae to defeat an Etruscan fleet, a success that poets were not slow to compare to the battle of Salamis, enhancing the tyrant's image as the defender of the western Greeks against barbarians. (The eastern Greeks had been similarly defended at Salamis.)

Hieron's ability to promote this image was much enhanced by his acquisition of the presence or services of poets from the Greek motherland including Aeschylus, Pindar, and Simonides of Ceos and his nephew Bacchylides. (Xenophanes of Colophon also came to Hieron's court but probably more briefly.) The most widely known celebrations of Hieron were those in the epinician odes of Pindar (*Olympian* 1, *Pythians* 1–3) and Bacchylides (*Odes* 3–5) for the victories of his teams in chariot and horse-and-rider events. The tyrant's building of a new stone theatre in Syracuse (*c.*475–470 BC), replacing a largely wooden one, also helped to proclaim his glory. Here, probably, was staged the Sicilian production of Aeschylus' *Persians* with its potential comparisons between Salamis and Cumae; possibly also, Tommaso Guardì suggests, Phrynicus' similarly appropriate *Phoenician Women*. (Epicharmus, the Sicilian comic playwright, no doubt also produced work – possibly including more by way of implied criticism of the tyrant – for Hieron's court.)

In 472 BC Syracuse became unequivocally the strongest force within Sicily when Hieron defeated Thrasydaeus of Acragas, Theron's less effective successor. Probably at this point Hieron could have installed his own dependants as tyrants of Acragas and Himera; James F. McGlew argues that his reason for not doing so was the desire to represent himself "as the liberator of the politically oppressed cities of Sicily". The cities he himself had most oppressed were Catana and Naxos, which were destroyed in 476 BC after the removal of their entire population to Leontini. (Hieron's help for Chalcidian Cumae may, as David Asheri says, have been designed to "obscure the memory" of his treatment of these fellow Chalcidian foundations.) Catana was refounded as Aetna and repeopled with 10,000 Dorians (half from Syracuse, half from the Peloponnese). One motive for this action was clearly, as Diodorus says, to obtain "from the recently founded city of 10,000 men ... the honours accorded to heroes"; at his death the tyrant indeed received these honours "as having been the founder of the city". Literature again helped to celebrate the founder and to inaugurate his settlement: Aeschylus wrote his lost *Women of Aetna*, performed in the new city probably in 471 BC, and Pindar saluted Aetna in the first Pythian ode and its governor, the loyal Chromios, in the first and ninth Nemean.

Another motive for founding Aetna was, as Diodorus realized, "to have a substantial help ready at hand for any need that might arise". When the crisis came with the expulsion of Thrasybulus, Hieron's brother and successor, the colonists supported him and were themselves expelled from Aetna, which became Catana once more; transferred to Inessa, they continued, according to Diodorus, to honour Hieron as their founding hero. No doubt they would have approved of Pindar's ideal Hieron, "gentle to citizens, not begrudging to good men, and to guests a wondrous father" (*Pythian* 3); it is less certain where the truth lies between this image and that constructed by Diodorus or his source – Hieron as "avaricious and violent and, generally speaking, an utter stranger to sincerity and nobility of character". (Gelon's rule was milder than Hieron's, says Diodorus; that of Thrasybulus, the last of the Deinomenid tyrants, on the other hand, was distinctly worse – he murdered many citizens, confiscated people's property, and was rapidly overthrown.) Hieron was clearly good at seizing the main chance and at claiming, through his poets as well as his deeds, the attention of posterity. Xenophon, for instance, uses his name if little else for the tyrant who debates with Simonides the advantages and disadvantages of tyranny in his *Hieron* . But, like many other Greek tyrannies, his did not survive into the next generation. It relied largely on force. It was underpinned by no constitutional theory, uncertain of its own position. (Finley finds a "touch of reticence" in the failure of Theron, Gelon, and Hieron to put their names, titles, or symbols of office on their coins – a result perhaps of a desire

for Panhellenic acknowledgement at a time when tyranny was no longer fashionable in Greece proper, where "tyrant" was, for the first time, becoming a synonym for "despot".) But Hieron's concern with military matters allowed commerce and agriculture to thrive; Asheri goes so far as to say that (except for the suffering of such unfortunates as the people of Catana) his rule was "a golden age for Syracuse".

Biography

Hieron ruled Gela from 485 to 478 BC as regent for his brother Gelon. On Gelon's death (478) Hieron succeeded him as tyrant of Syracuse. Under Hieron Syracuse became the most powerful state in Sicily and he gained a reputation as defender of the western Greeks. He enhanced his prestige by attracting to his court poets such as Aeschylus, Pindar, Simonides, Bacchylides, and Xenophanes. He died at Aetna in 466 BC.

Hieronymus of Cardia *c.*364–?260 BC

Administrator and historian

Hieronymus made his name in antiquity mainly as a historical figure – a friend and ambassador of kings, a military man with a remarkable fighting record, a local governor and administrator, someone who managed to survive by switching sides at the right moment, and as a *makrobios* (long-lived person) who, notwithstanding his many wounds and war toils, reached the respectable age of 104 (Jacoby, 1962, no. 154, TT2, 6–8, F8). His merits as a writer and as a historian were less admired in antiquity. His work was never seen as a breakthrough in the development of Hellenistic historiography. The influence of his predecessors can be detected in the scanty remains of his work (of which even the title, or rather its contents, is variously reported). Thucydides and Xenophon might have taught him that serious history must be contemporary and "pragmatic" – that is, eyewitnessed and followed closely by an actively participating historian. His ethnogeographical introductions and digressions remind us of Herodotus. Perhaps Theopompus was his model for a new kind of historywriting in making a king or a great individual the centre of the narrative. Thanks to such traits, Hieronymus belongs to the large crowd of Alexander historians, most of them his contemporaries. Finally, his easy access to documents and memoirs kept in the chancelleries of his masters (Eumenes, Antigonus Monophthalmus, Demetrius Poliorcetes, Antigonus Gonatas) may have influenced his style.

Ancient references to his work outline to some extent Hieronymus' impact on his successors. The first to show some acquaintance with the early literary reputation of Hieronymus is Moschion (late 3rd–early 2nd century BC), the author of a paper in honour of Hieron II of Syracuse, who states that Hieronymus was much admired for his account of the carriage built to convey the body of Alexander the Great (F2). His description of the Dead Sea and its asphalt was noticed by the Hellenistic Florentine Paradoxographer (F5=10 Stern). These two early examples show what kind of material impressed most of Hieronymus' early readers. In the 2nd century BC Agatharcides of Cnidus was aware of Hieronymus' long career (T2); it is remarkable, however, that Polybius, though a great advocate of "pragmatic" history, does not mention him. In the 1st century BC Diodorus mentions Hieronymus four times as a historical figure and as the author of a history of the Diadochi (TT3–6), but he never quotes him as a source in his books 18–20, covering the same period. Dionysius of Halicarnassus, writing in the time of Augustus, includes Hieronymus in a list of historians that "no one can bear to read to the final flourish" (T12). The same Dionysius nevertheless pays homage to Hieronymus for being the first to touch upon the antiquities of Rome (F13). Dionysius' contemporary, the geographer Strabo, took an interest in Hieronymus' ethno-geographical digressions on Corinth, Thessaly and Magnetis, and Crete (F16–18). In the late 1st century AD Josephus complained that Hieronymus omitted in his book any mention of the Jews, although he served in Syria and lived in their vicinity, and concluded that some "bad feeling" must have dimmed Hieronymus' understanding to see the truth (F6). Plutarch used Hieronymus for his *Lives* of the Diadochi, and quotes him as a source in his *Life of Pyrrhus*, but surprisingly not in his *Lives* of Eumenes and Demetrius. He quotes him together with Dionysius of Halicarnassus on the number of the dead at the battle of Heraclea (F11), while on those at Ausculum he quotes him together with Pyrrhus' *Hypomnemata* (which may have been quoted by Hieronymus himself). He is also quoted, together with Phylarchus, for a marginal detail of Pyrrhus' Spartan campaign (F14).

In the 2nd century AD Appian quotes Hieronymus in his *Mithridatica* as saying that Alexander never came into contact with the peoples of Cappadocia, a view rejected by Appian himself (F3). In all likelihood, Hieronymus was Appian's main source on the life and death of two early Cappadocian rulers Ariarathes and Mithridates. But the most interesting piece of evidence on Hieronymus' reputation in the 2nd century AD comes from Pausanias, who in a section on Lysimachus includes a reference to Hieronymus' reporting that Lysimachus, during his war against Pyrrhus, destroyed the tombs of the Epirote kings. This story seemed "incredible" to Pausanias, considering that Hieronymus "had a reputation generally of being biased against all kings except Antigonus", that "it was malice that made him record that a Macedonian desecrated the tombs of the dead", and that "possibly

Hieronymus had grievances against Lysimachus, especially his destroying the city of the Cardians and founding Lysimachia in its stead" (F9, T11). The charge of partiality is repeated by Pausanias in connection with Pyrrhus' death at Argos, Hieronymus' version being "different" from the one given by the Argives themselves. Pausanias was not surprised, for "a man who associates with royalty cannot help being a partial historian" (F15). He does not bother to tell us what was Hieronymus' version, but it evidently was not a supernatural one like that of the Argives.

The last references to Hieronymus in Roman times come from Athenaeus and from a treatise attributed to Lucian. Athenaeus includes Hieronymus in a list of historians recording the length of Perdiccas' reign (F1). This may show that Hieronymus probably had an introduction, or a digression, on the earlier kings of Macedon. Finally, pseudo-Lucian's *Makrobioi* includes four entries of Hieronymus', giving the ages of Ariarathes, Mithridates, Lysimachus, and Antigonus Monophthalmus at their deaths.

No extant Latin author ever mentions Hieronymus, not even Eumenes' biographer Nepos, nor Quintilian in his brief survey of Greek historians (10. 1. 73–5). In Byzantine times, Stephanus of Byzantium apparently did not find in Hieronymus any toponym worth mentioning, and his history was not among the books left unread by Photios' brother Tarasios. Yet, the concise entry in the *Suda* lexicon (T1) shows that he was not altogether forgotten.

In sum, judging from the named fragments, it must be concluded that Hieronymus did not enjoy great popularity in antiquity. His ethnogeographic digressions attracted readers more than his main political and military narrative, and he was much consulted for his numbers – years of age, numbers of dead in battles, lengths of reigns, and measures. He may have been used by historians extensively, but since they rarely acknowledge their debt to their predecessors, the result was that in antiquity nobody ever suspected that Hieronymus may be hidden in Diodorus' books 18–20, or in Plutarch's biographies of the Diadochi. Only in modern times was Hieronymus elevated to the rank of a great historian. On the basis of the widely accepted hypothesis that Diodorus' books 18–20 are basically taken from Hieronymus, scholars tried to reconstruct his work, to assess its value as a history book, and even to redeem its style (although not one verbal quotation of him is preserved). Thus, he has been eulogized for carefully collecting documents, for being a representative of "scientific historiography", for his "lively and lucid narrative", and for his "most appealing" section on Eumenes (on whom he is never actually quoted). The truth is that the case for finding Hieronymus in Diodorus is rather weak. No argument in favour is truly compelling. Diodorus never mentions him as a source, and the correspondence of some five named fragments to Diodorus is only partial, an argument that may be used not for but against Diodorus' dependence on him. Hieronymus is indeed an excellent example of the modern ability of resurrecting a figure that in the Hellenic and Byzantine tradition was only a marginal one.

Hipparchus

Astronomer, geographer, and mathematician of the 2nd century BC

Hipparchus, the first astronomer to combine observation and trigonometry, was born in Nicaea, Bithynia, and flourished in the middle of the 2nd century BC, the years of his recorded observations being between 147 and 127 BC. Ptolemy gives dates for Hipparchan observations as early as 162 BC, but this date is suspect. Quite unlike other scientists in antiquity, whose biographies tend to be preserved in anecdotal gems, Hipparchus' life is poorly known. The single biographical anecdote, that he once attended the theatre in a cloak because he had predicted rain (Aelian, *De Natura Animalium*, 7. 8), is probably spurious. Hipparchus is said to have observed in Nicaea, and Nicaean coinage of Roman imperial date bears witness to that city's claim to his heritage. There is no good evidence, contrary to some opinions, to associate Hipparchus with Alexandria (see Dicks, 1960, pp. 5–8); however, he often refers to Athens, and frequent references to Rhodes suggest that he spent much of his career there.

Although Hipparchus' writings are almost entirely lost, at least 14 separate treatises are known by title; these cover specialized approaches to issues in astronomy, mathematics, and geography. Only one of his works survives in more than just a handful of disparate fragments. Still, judging by the treatment his opinions receive from subsequent authors, it is clear that Hipparchus' contribution in several areas was significant.

Hipparchus' mathematical and astronomical concepts allowed him to predict both solar and lunar eclipses: presumably he published these, and Pliny (*Naturalis Historia*, 2. 54) says that Hipparchus predicted both types of eclipses for a period of 600 years. Whether these data were actually calculated by Hipparchus or digested by him from Babylonian sources remains unclear; but his combination of Babylonian and Greek intellectual traditions produced astronomical knowledge of crucial importance well beyond Ptolemy's transmission of it. Ptolemy, who wrote in the 2nd century AD, had studied Hipparchus carefully but was more interested in improving upon Hipparchus' data than he was in preserving them. Hipparchus, however, retains the distinction of having turned astronomy into a mathematical, predictive science. Dicks (p. 11) regards him as a scientist who was "patient, painstaking, accurate, unwilling to theorize except on definite data which can be scientifically checked and verified, content if his work makes even a small contribution to the general body of knowledge".

Hipparchus was the first to use trigonometry in a precise method – i.e. not by estimation as Aristarchus and Archimedes had – and was the first to construct a chord table, the first element of trigonometry (see *On Chords in a Circle*). His general solution for trigonometrical problems was "as effective as, if more cumbersome than, those of modern trigonometry" (Toomer, 1978, p. 209). Using this tool, Hipparchus calculated the parallax of celestial objects and accurately calculated both solar and lunar parallax. The latter calculation, 58', differs from the International Astronomical Union's value of 57.02'.688", or by less than 2 per cent. Indeed, most of Hipparchus' figures are of similiar accuracy, e.g. his calculated length of the tropical year (365.2467 days) differs from the modern value by just 0.0042 of one day, or about six minutes. Concerning his measurement of the sun's size and distance from the earth with crude and scanty data, Toomer (p. 215) calls Hipparchus' methods "a tour de force". Hipparchus' solar theory was adopted by Ptolemy unchanged, and others, including Vettius Valens, used it as well. He observed a 2-degree precession of Spica over 154 years, between Timocharis' observation and his own (made in 130 BC), and thus anticipated the precession of the equinoxes, and calculated the time it takes for the equinoctial points to make a complete revolution around the earth's celestial perspective. For tools, Hipparchus seems to have used a diopter and a celestial sphere; he may, in fact, have invented the plane astrolabe.

Hipparchus' *Commentary on the* Phaenomena *of Aratus and Eudoxus* contains less of the scientific calculation and explication than we might expect to find in his works. It is, nevertheless, important as a representative of this writer, since it contains much solid argument and not a little of the urgency that Strabo saw in Hipparchus' dispute with Eratosthenes' geographical treatise. About a century before Hipparchus' birth, the Alexandrian poet Aratus had written his great didactic poem on the constellations. Drawing freely upon the astronomy of Eudoxus of Cnidus (*fl.*340 BC), Aratus composed the *Phaenomena* (*c.*276 BC). To the astronomer possessed of mathematical and observational skills, the eloquence of Aratus' poetry could not compensate for the poem's factual errors. The addressee of the *Commentary*, the otherwise unknown Aeschrion, had shown interest in the poem's astronomy and thus receives from Hipparchus a detailed criticism of its astronomical fallacies. The *Commentary* consists of three books, which comprise extensive criticism of both Aratus' poem and its fundamental basis provided by Eudoxus, and detailed listings of simultaneous risings and settings of constellations. Additionally, Hipparchus addresses mistaken beliefs of his own contemporaries, specifically those of the mathematician Attalus (*fl.* mid-2nd century BC). Arguing against the entrenched popularity of Eudoxus, Aratus, and Attalus, however, proved unsuccessful. Still, painstaking analysis of the data in the *Commentary* "has revealed, and will reveal, a surprising amount" about ancient misunderstandings of Hipparchus and the importance of his research (Toomer, 1978, p.208).

Hipparchus' other writings include a treatise in which he used mathematical data to contradict Eratosthenes' great *Geographica*, especially the geographical and mathematical details. It is surprising to find in his bibliography a treatise on astrology. He also wrote on the calendar, on optics, on permutations and combinations, and, perhaps, on gravity (*On Objects Carried down by Their Weight*).

Hippocrates *c.*460–*c.*370 BC

Physician

Hippocrates of Cos, a Greek physician already renowned by the time of Plato and Aristotle, remains an elusive historical figure despite his fame as the founder of scientific medicine. The earliest characterizations of Hippocrates – for example, in Plato's *Phaedrus* – do not seem to be fully compatible with any of the more than 60 extant works already attributed to him in antiquity (and known in modern times as the Hippocratic Corpus). Furthermore, not even the extant Hippocratic treatises believed by modern scholars to have been written as early as the 5th century BC (for example, *Airs Waters Places*, *Sacred Disease*, *Prognosis*, *Prorrhetic II*, *Epidemics I* and *III*, *Art*, *Ancient Medicine*, *Nature of Humans*, *Regimen in Acute Diseases*, and *Winds*) can be ascribed with certainty to the historical Hippocrates. Epigraphic and literary evidence renders it likely, however, that Hippocrates was only one of several physicians called "Hippocrates", that he belonged to a famous family of physicians, that he claimed patrilineal descent from Asclepius, that he was born on the island of Cos, and that he later lived in Thessaly.

The doctrinal, methodological, and stylistic heterogeneity displayed within the Hippocratic Corpus suggests that its texts were composed, for the most part, between 430 and 330 BC by a variety of authors, drawing on divergent traditions, and that these texts gradually became collected under the name of Hippocrates, starting in the early Hellenistic period. "Hippocrates" remained a magnet for medical texts in the later Hellenistic and Roman periods: his name became attached to post-Classical works such as *Heart*, *Nutriment*, *Law*, *Precepts*, and *Decorum*. Despite the pluralism of traditions represented in the Hippocratic collection, it displays certain recurrent commitments. Among these is an emphasis on meticulous observation (e.g. *Epidemics*, *Prognostic*, *In the Surgery*, *Diseases II*, *Sacred Disease*), on rational inference from observed signs, and on non-divine causes.

The Hippocratic secularization of explanation, i.e. explicitly substituting "natural", physical causes for divine agency, is visible, for example, in the explanations of the Scythians' impotence in *Airs Waters Places* and of epilepsy in *Sacred Disease* (which also offers the first explicit systematic criticism of magic). Furthermore, *Nature of Humans* distinguishes between general diseases caused by miasmic air (which affects numerous people in similar ways) and particular diseases caused by individual regimen, while *Regimen in Acute Diseases* recognizes that a similar effect may be brought about by different causes, and *Regimen* introduces the distinction between cause and coincidence. In all these cases the traditional attribution of human disorders to divine intervention is usurped by an explanation in terms of the interaction of matter with matter, in accordance with the properties of the constituents of things. Some Hippocratics display little interest in aetiology, however, and others advance a cautious view of causal generalization. The author of *On Ancient Medicine*, for example, criticizes new theorists who, like philosophers, engage in general speculation and put forward reductive causal "hypotheses" (the hot, cold, dry, and wet) to explain diseases. The proven method of medicine, he claims, is instead to start from past observations of the effects of regimen.

For all their secularizing strategies, the Hippocratics do not deny the existence of the gods or of the divine. The Hippocratic *Oath* begins by invoking Apollo, his son Asclepius, Asclepius' daughters Hygieia and Panaceia, and "all gods as well as goddesses". Traditional gestures of respect for the power of the gods are present in other works too (*Regimen I* and *IV*, *Prognostic*, *Nature of Women*). Furthermore, treatises such as *Diseases of Women* accommodate not only the new Hippocratic "scientific" medicine, but also elements of traditional folk medicine, for example, in pharmacological tests for fertility or pregnancy or for the gender of the foetus.

Contest and warfare are central metaphors of Hippocratic medicine, as of modern biology. Within the body an incessant *agon* (struggle) between rival elements, juices (including humours), and parts determines health and disease. The desired outcome is sometimes depicted as a stalemate or balance between the opposing forces, but more often it is a victory of one over the other(s). Internal contestants also enter into an *agon* with external factors: *Airs Waters Places*, *Epidemics*, *Aphorisms*, *Humours*, and *Diseases of Women* present the environment (seasons, winds, sites, water) as a central determinant of health and disease.

The influential theory of bodily "humours" or liquids, whose excess or deficiency can cause disease, appears in several rival versions in the Corpus. A two-humour model – bile and phlegm – is invoked in *Diseases I* and *Affections*, whereas different four-humour theories appear elsewhere: phlegm, bile, blood, and water (*Generation/Nature of Child*, *Diseases IV*); phlegm, bile, black bile, and water (*Affections* 36, *Remedies*); and, the most famous version, phlegm, yellow bile, black bile, blood (*Nature of Humans*). Many Hippocratic works do not, however, make systematic use of any humoral theory. *Regimen* regards fire (hot and dry, providing motion to the body) and water (cold and wet, providing nourishment) as the constituents of living beings, while *Winds* (*Breaths*) argues that air inside the body is the principal cause of illness. A pluralism of traditions is also visible in Hippocratic theories of reproduction and embryology, in gynaecology, and in therapeutics.

The *Oath* displays unique features but it is not entirely incompatible with deontological emphases in other Hippocratic texts. Responsibility to one's *techne* (i.e. to one's result-oriented professional expertise and to a practice consistent with that expertise) and to its reputation is often depicted as the physician's prime motivation. The concern with reputation, perhaps along with the relative insecurity of Greek physicians within the social and economic order, might be a reason both for the defensive posture of some works (*Art*, *Law*) and for the significant role ascribed to accurate prognosis in others (*Prognostic*, *Prorrhetic I–II*, *Coan Prenotions*, *Airs Waters Places*, *Internal Affections*, *Diseases I–II*, *Regimen in Acute Diseases – Appendix*, *Crises*, *Joints*, *Fractures*, *Instruments of Reductions*). The frequent prognosis of incurability and death, the polemics against charlatans, magicians, and incompetent practitioners, the overt awareness of iatrogenesis, and the emphasis on the avoidance of ostentation and theatricality likewise seem to be motivated by a concern with reputation.

Already in antiquity the impact of the works ascribed to Hippocrates was enormous. As early as the 3rd century BC

members of rival medical schools began to write Hippocratic lexica and extensive commentaries on Hippocratic texts, and a commentary of the 1st century BC by Apollonius of Citium on the Hippocratic treatise *On Joints* is extant. This exegetical tradition remained active for centuries. The most influential Hippocratic reader of all time was probably Galen, who used early 2nd-century AD editions of "Hippocrates" by Dioscurides the Younger and Artemidorus Capiton. Early Byzantine medical encyclopaedists (Oribasius, Aëtius of Amida, Paul of Aegina) as well as numerous Church Fathers and philosophers, including the Aristotelian commentators, also gave Hippocrates ample recognition, but Galen's commentaries decisively shaped later Alexandrian and Byzantine commentaries on Hippocrates (e.g. by Palladios, Stephanos of Athens, John of Alexandria) as well as the method of teaching "Hippocrates". The medieval translations of Galen's Hippocratic commentaries into Latin, Syriac, and Arabic ensured that Galen presented posterity, both in the east and in the west, with a version of "Hippocrates" that became a culturally obligatory point of departure for subsequent European medicine until the early modern era.

Hippocrates' *Oath*, translated by the author

1. i. I swear
   ii. by Apollo the Physician and
   by Asclepius and
   by health and Panaceia and
   by all the gods as well as goddesses,
   making them judges [witnesses],
   iii. to bring the following oath and written covenant to fulfilment,
   iv. in accordance with my power and judgement:
2. i. to regard him who has taught me this *techne* as equal to my parents, and
   ii. to share, in partnership, my livelihood with him and to give him a share when he is in need of necessities, and
   iii. to judge the offspring [coming] from him equal to [my] male siblings, and
   iv. to teach them this *techne*,
   should they desire to learn [it],
   without fee and written covenant, and
   v. to give a share
   both of rules
   and of lectures,
   and of all the rest of learning,
   to my sons and
   to the [sons] of him who has taught me and
   to the pupils who have
   both made a written contract and
   sworn by a medical convention but by no other.
3. i. And I will use regimens
   for the benefit of the ill
   in accordance with my ability and my judgement,
   ii. but from [what is] to their harm or injustice
   I will keep [them].
4. i. And I will not give a drug that is deadly to anyone if asked [for it],
   ii. nor will I suggest the way to such a counsel.
   iii. And likewise I will not give a woman a destructive pessary.
5. i. And in a pure and holy way
   ii. I will guard
   iii. my life and my *techne*.
6. i. I will not cut,
   and certainly not those suffering from stone,
   ii. but I will cede [this]
   to men [who are] practitioners of this activity.
7. i. Into as many houses as I may enter,
   I will go for the benefit of the ill,
   ii. while being far from all voluntary and destructive injustice,
   especially from sexual acts
   both upon women's bodies
   and upon men's,
   both of the free
   and of the slaves.
8. i. And about whatever I may see or hear
   in treatment,
   or even without treatment,
   in the life of human beings
   – things that should not ever be blurted out outside –
   ii. I will remain silent,
   holding such things to be unutterable [sacred, not to be divulged].
9. i.a. If I render this oath fulfilled,
   and if I do not blur and confound it [making it to no effect],
   b. may it be [granted] to me to enjoy the benefits
   both of life and of *techne*,
   c. being held in good repute
   among all human beings
   for time eternal.
   ii.a. If, however, I transgress
   and perjure myself,
   b. the opposite of these.

Biography

Born *c.*460 BC in Cos, Hippocrates was the most renowned physician of antiquity, yet detailed knowledge of his life remains elusive. More than 60 extant works were attributed to him in antiquity and are now known as the Hippocratic Corpus. Most probably he was one of several physicians with the name Hippocrates, and he belonged to a family of physicians. Most of the "Hippocratic" texts seem to have been written between 430 and 330 BC.

Hippodrome

A hippodrome was a horse-racing or chariot-racing arena, similar in layout to a stadium for athletics and foot races, with an elongated U shape and tiers of seats surrounding the track. Hippodromes (or circuses) were widespread in the Roman empire, especially in Rome itself and in North Africa, as at Carthage. However, some hippodromes were built in the eastern Roman empire, for example at Thessalonica in Greece.

By far the most celebrated (and historically significant) hippodrome was that in Constantinople. The city's first hippodrome was constructed under Septimius Severus in the 2nd century AD and was rebuilt during the reign of Constantine I (306–37 AD). Like the hippodrome in Thessalonica, it was adjacent to an imperial palace: the Great Palace of the Byzantine emperors.

The hippodrome in Constantinople was built of brick and stone and to a classic elongated U design, with at least some architectural decoration in stone on its exterior. The whole structure was approximately 480 m long and 117.5 m wide. The southern, curved, end (the *sphendone*), the only substantial part of the building still standing, clearly shows several stories of rooms and vaulted brick-built chambers. There was a row of large columns around the upper part of the exterior of the whole building.

The hippodrome had a complex set of entrance arrangements for both court and public. There was a direct covered stairway (the *kochlias*) from the Great Palace into the imperial box (the *kathisma*) located on its eastern side. Behind the box was a private area which in turn led to the palace through bronze doors. The main public entrance was a monumental structure (*carceres*), probably slightly bowed outward, at the northwestern side. Although its exact form is debatable, this entrance once had large bronze doors opening onto the Augusteum, a stepped entranceway, and elaborate decoration.

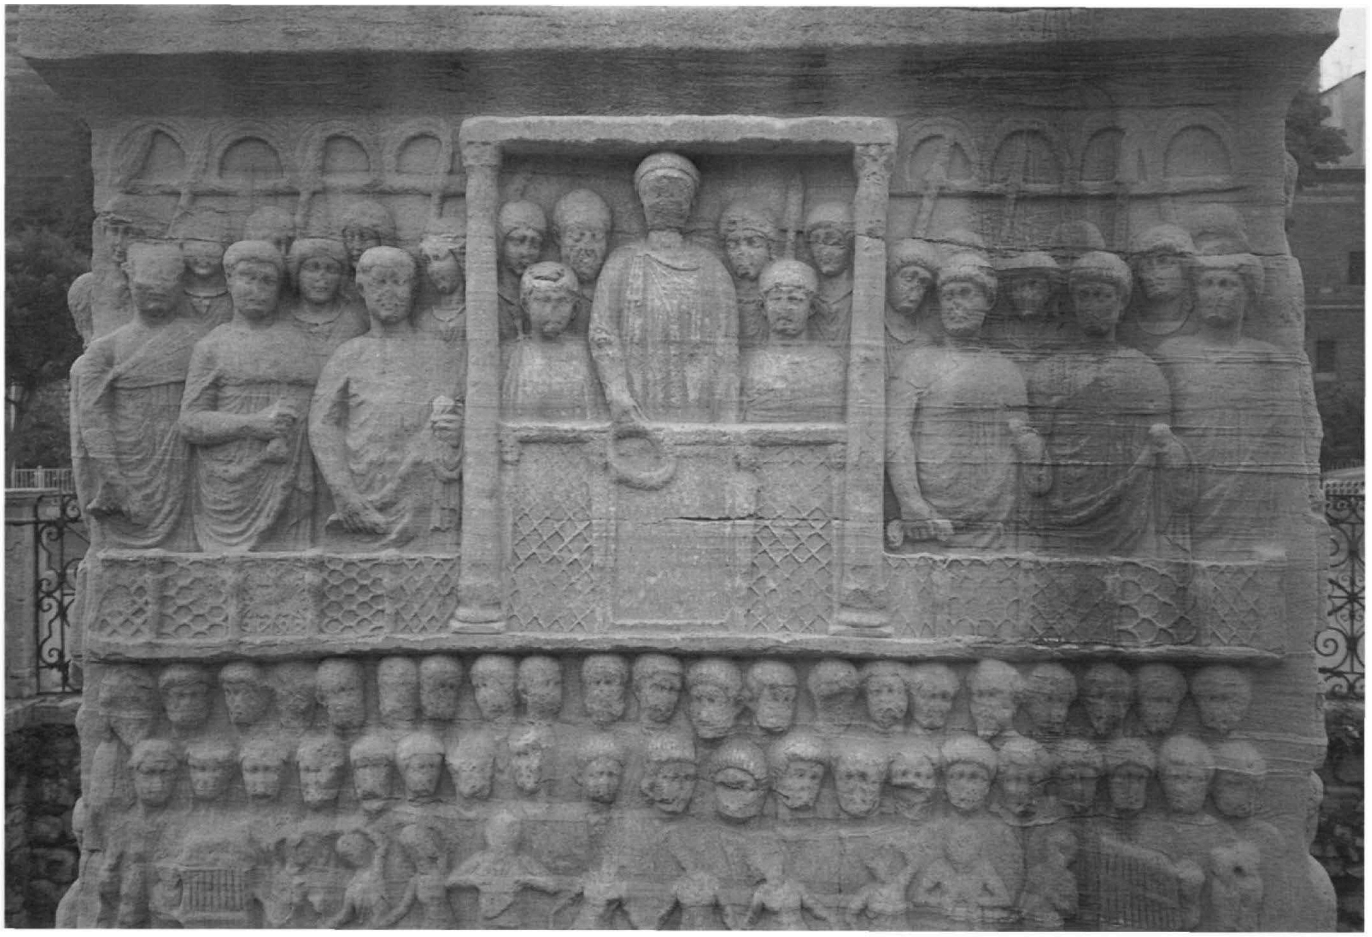
Although the emperor's entourage sat on seats within the imperial box, the majority of the population sat on tiered seats, affording them a clear view of both the track and the emperor. The track itself was floored with sand and divided into two by a *spina* or central reservation, marked with free-standing monuments. It was around this reservation that the chariots raced. Notable among these monuments are a 5th-century BC bronze tripod (originally in the form of serpents) from Delphi, a 16th-century BC Egyptian obelisk originally from Thebes in Upper Egypt, and a stone pillar (which an inscription records was covered in bronze by Constantine VII Porphyrogennetos), all of which still survive in some form. The base of the obelisk is a 5th-century AD marble block, elaborately sculpted on all sides with scenes depicting the emperor Theodosius I and his family in the hippodrome.

Races were between light two-wheeled chariots. The hippodrome chariots were divided into four teams – the reds, whites, blues, and greens – which attracted mass popular support. The citizens of Constantinople took a great interest in their favourite charioteers, horses, and teams, and stone monuments were even erected in their memory. Organized fan clubs adopted special dress, formed choirs, and took part in mob violence. These groups – especially the increasingly dominant blues and greens – began to adopt specific views on current controversies, and took on a somewhat "political" character. This led to major outbreaks of violence, notably the Nike riot of 532, which was only ended by the use of military force against the protesters and a massacre in the hippodrome itself.

From the 4th century onwards the hippodrome was used not only for chariot racing but also for other entertainments and for public events. The latter included celebratory ceremonies and the execution of criminals and enemies of the state – and western-style jousts in the 12th century. The hippodrome was also the arena for the public acclamation or disapproval of the emperor's policies and court by the populace, who could in this way have a small degree of direct contact with their ruler.

Chariot racing proved exceptionally popular during the early Byzantine period, but increasing religious and official disapproval led to its decline after the 6th century. Although chariot races were still occasionally held in the middle Byzantine period – in the 9th century the emperor Theophilos himself competed in a race – the hippodrome became more generally used for ceremonies and executions. With the Latin conquest of the city in 1204, the hippodrome fell into disuse.

Following the Ottoman conquest of 1453 the ruinous arena was again used for ceremonies and entertainments of other sorts. Although partially demolished in order to construct the



Hippodrome: relief at the foot of an obelisk in the hippodrome in Constantinople showing the emperor Theodosius I in his box watching the games

Sultan Ahmet mosque in the early 17th century, the site is clearly visible today within the urban fabric of Istanbul and survives as an open square known aptly as At Meydani ("the square of the horses").

Historiography

Antiquity

Historie (inquiry) is the Ionic form of what in other Greek dialects is *historia*. The term is, however, first used by the Ionian writer Herodotus, who talks about "the presentation of his research", undertaken "to preserve the actions of individuals from fading with time and so that the great and wondrous works of peoples, both Greeks and foreigners, should not lack renown" (1. 1). It quickly becomes apparent that any exami-

nation of this undertaking inevitably involves consideration of the various techniques and procedures – and raises several questions. For example, when did people first wish to preserve a record of their achievements, and what sort of achievements, particularly? How did they remember their past? How did they reckon the passage of time? Why does all this, for the Greeks at any rate, seem to have begun in "Ionia"?

Although there is no general agreement over the details, certain broad points can be made. As the term *historiography* implies, literacy is a prerequisite for the production of real history – illiterate peoples may have memorized lists of rulers, memorials of great deeds, and even elaborate sagas, but these productions lack the analytical and comparative approach to evidence that is possible only with writing (although oral tradition always remained an important source in Greek historiography). In the Near East and Egypt there was a long tradition, going back to the 3rd millennium BC, of recording the names of rulers and their deeds; and in the Jewish/Hebrew religious tradition there were certain works that can, by the strictest definition, be called historical. Accordingly, just as "Ionia" absorbed and developed crucial elements of eastern mathematics and astronomy, it is equally possible that the fundamentals of chronography and local and regional history and the recording of the great deeds of individuals came to the Greeks from the same source. It was in "Ionia" that the earliest prose accounts appeared of the shape of the world, the customs of various peoples, and examinations of myth and genealogy, and it was here too that local histories first began to be written: little of this work survives beyond testimonia, but Hecataeus of Miletus (*fl. c.*500 BC), writing on geography and genealogy, was important and influential (369 fragments of his work survive in F. Jacoby's *Die Fragmente der griechischen Historiker* (1923–),where he is the first historian listed). This Ionian tradition persisted to at least the end of the 5th century BC, as can be seen from the career of Hellanicus of Lesbos (*c.*480–after 400 BC; 201 fragments survive), among whose numerous works were the *Priestesses of Hera at Argos* (cited apparently by Thucydides at 2. 2) and the first *Atthis*, or local history of Attica.

The Homeric poems, too, exercised an important influence on Greek historiography, though they are not themselves history. They are concerned with the past, however, and Homer frequently refers to the differences between the past and the present and to the human desire to be remembered: great deeds are commemorated in various ways and human glory is closely connected with prowess in war; genealogies occur frequently, as does the idea of the community as the vital centre for human existence (cf. *Iliad*, 5. 304–05, 6. 145–211, 22. 304–05; *Odyssey*, 1. 2–3). The date of "Homer" remains controversial, but if West's recent suggestion that the *Iliad* was composed in its monumental form between 670 and 640 BC (with a preference for 660–650 BC) is cogent, then we are clearly in the literate period; Greek colonization, both in the Black Sea area and in the west, was in full swing; and the main themes of the Homeric poems and the impulses that led to the early Ionian prose chronicles are not only similar but nearly contemporaneous.

Herodotus of Halicarnassus (dates quite uncertain, but probably writing after 440 BC) is, then, heir not only to the various subjects and techniques of the earlier Ionian prose-writers but also to the Homeric subject matter, war, and to Homeric *mimesis*, the recreation of a scene so vividly that the reader seems almost to be part of it. In examining Herodotus' work we have the advantage, rare in Classical historiography, of studying something that is whole and complete: we can see its entire shape as its author planned it, and we do not have to worry about "incomplete revisions" or "strata of composition", nor must we try to identify second, or even third, thoughts on certain topics, as is the case in Thucydidean studies. The great story of the war between Greeks and non-Greeks, which goes back to mythical times and culminates with the victories at Plataea and Mycale and their immediate aftermath in 479 BC, starts with extended ethnographic accounts of the parts of the Persian empire and follows its growth in a historical sequence; the attempts by Darius and Xerxes to expand the empire by incorporating into it all of mainland Greece lead to the climactic war narrative in books 7 to 9. Underlying all of this are the basic notions of action and reaction: someone does something to another, the latter responds, the first does something else, and so on – this is the basic causative impulse in human affairs.

Any reader of Herodotus quickly realizes that he is, above all, a master story-teller; we also know that he recited "sections" of his work before audiences. Over the years and as a result of frequent retelling, these tales came to take on a smooth, effortless form; their sources, whether oral or written, or the result of personal experience or observation, were blurred and "improved on" for narrative effect (the end result of this process can be seen in Hammond's brilliant analysis of Herodotus' narrative techniques in the account of events leading up to Xerxes' invasion in 480 BC (7. 117–79) – the "Chinese box" construction, with recurring verbal markers to indicate stages going into and coming out of a particular topic, and a succession of separate narrative "strings" with key phrases to signal the move from one theme to another). Accordingly, Herodotus' tales, particularly those pertaining to strange and wondrous sights and remarkable events in far-off lands, should not be pressed too far. He is more likely to be careful (and correspondingly more accurate) in books 7 to 9, which deal with near-contemporary history. Finally, we may assume that, when he decided to commit his "lectures" to written form, the whole process was relatively quick and easy.

With the Athenian Thucydides in the later 5th century BC we come to the most interesting, complex, and, above all, authoritative of ancient historians. From Herodotus he may have derived the idea of writing the history of a war, but in Thucydides' case it was a contemporary war. Furthermore, Thucydides talks directly to us about his sources, his methods of handling evidence, and about the speeches that are so striking a feature of his account (1. 21–22). He was not the first historian to provide speeches, but his are so important to his history as a means of conveying important information and forming impressions in the audience's mind that they would merit the attention lavished on them by scholars and critics even if they had not started a practice almost universal in Greek historiography thereafter. However, there is no agreement about what Thucydides meant in a very difficult sentence about his practice with regard to speeches (1. 22. 1): Wilson's suggestion "as it seemed likely to me – keeping as closely as possible to all the points made in what was actually said – that

each party would have appropriately spoken about the various situations, so I have written" is possibly as cogent a translation (for avoiding an apparent but improbable self-contradiction in the Greek) as we are likely to get. This was Thucydides' aim: whether he achieved it (or even stuck to it) is another matter altogether. We shall never know how closely the Funeral Oration in book 2 approximates to the actual words uttered by Pericles in the autumn of 431 BC. As for events, Thucydides claims to have written with "the utmost possible accuracy" (*akribeia*: 1. 22. 2). Finally, he expresses the hope that his history will be "useful": he does not state that it will provide a guide for future conduct or furnish pleasure to the reader. Such ideas about history writing came rather later.

Thucydides has always been regarded as an "objective" historian. Modern literary theory, however, denies the possibility of any such absolute concept: in strict logic this is undeniable and recent studies of Thucydides have tended to emphasize such features as his habit of telling his audience what his characters are thinking and his use of phrases designed to make his audience trust him (this is Thucydides the "artful reporter", in Hunter's memorable phrase). However, "objectivity" is a very slippery term and Thucydides still stands out as a beacon for accuracy among ancient historians.

The Thucydidean narrative breaks off abruptly in the year 411 BC and several later historians seem to have aimed to carry on from the break point – more or less: the Athenian Xenophon wrote, over a considerable period of time, the *Hellenica* in seven books, which extended from 411 to 362 BC; the "Oxyrhynchus historian" (probably the Athenian Cratippus: see Harding), of whose work approximately 20 pages of Greek text survive on papyrus and written in the Thucydidean manner (though with no speeches), was probably a contemporary of the events described and covered the period from 411 to 395 BC; and Theopompus of Chios produced *Hellenica* in 12 books, covering the period from 411 to 394 BC; Theopompus, one of the most important historians of the 4th century BC, also produced a new kind of history, focusing on the career of a single individual: his *Philippicae Historiae* in 58 books represented a "universal history" (involving deeds of Greeks and foreigners alike; see below) on a very broad canvas indeed, with numerous digressions and a highly rhetorical style, but with Philip II of Macedon as the unifying core. This type of history, centred on a single, magnetic personality, was continued in the Alexander-histories of Callisthenes, Aristobulus, Chares, Nearchus, Ptolemy I, and many others, including the much later but extant Arrian of Nicomedia (2nd century AD).

The other major historian of the 4th century BC was Ephorus of Cyme (*c.*405–330 BC), whose work in 30 books, from the return of the Heraclidae to the siege of Perinthus in 340 BC, was probably the earliest "universal history". Though not highly regarded today (perhaps unfairly: for a balanced assessment see Fornara, pp.42–46), Ephorus was widely known and quoted throughout antiquity and was the main source (for Classical Greek history) of Diodorus of Sicily (1st century BC) of whose "universal history", the *Bibliotheca*, 15 from an original 40 books survive.

Among the major trends in historiographic theory in the generations immediately following Thucydides are the notion that history can teach us moral lessons (cf. Xenophon, *Hellenica*, 5. 3. 7) and a parallel tendency to pass judgement on, or "award points" to, an individual, an entire career, or the behaviour of a political entity (a self-important fatuity that continues to the present day, but which, again, starts with Xenophon; cf. *Helenica*, 7. 5. 8). Ephorus was particularly prone to these practices, especially with regard to the characters of individuals; and these moralizing appraisals, with particular emphasis on praise and blame, became a characteristic feature of later historiography.

Other, older concerns continued to be addressed, however: Timaeus of Tauromenium in Sicily (*c.*350–260 BC) produced a chronology based on Olympic victors, cross-referenced to Athenian archons, Spartan kings and ephors, and priestesses of Hera at Argos: dating by Olympiads soon became standard practice. In addition, Timaeus wrote an extensive history of Sicily in 38 books, incorporating geography and ethnography as well as political history. Furthermore, he is remembered for his critical analysis of the works of his predecessors, which often degenerated into hostile abuse.

The moralizing tendencies of Ephorus and the critical use of earlier historians by Timaeus were developed by Polybius of Megalopolis (*c.*200–*c.*118 BC), of whose 40-book history of Rome's rise to supremacy in the Mediterranean world substantial portions survive. Polybius also believed that history was useful to politicians and that study of the past could enable reasonable predictions about the future to be made (cf. 3. 31–32), an idea that he may have absorbed during his stay in Rome and which finds its most striking expression in the preface to Livy's history *Ab Urbe Condita*. As for sources, Polybius quotes his predecessors, often at considerable length, which is valuable, but frequently also with hostile analysis (cf. his attack on the credibility of Fabius Pictor at 3. 8. 1–9. 5, or his citation of Callisthenes on the Battle of Issus at 12. 17–22). From his examination of Rome's rapid development of overwhelming power Polybius concluded that the city's governance had been the main contributing factor and from this he developed 5th-century ideas of a "mixed" constitution (in this case a combination of monarchy, oligarchy, and democracy, with a precise combination of these three elements) into his main explanatory concept.

Given the eventual predominance of Rome, it is not surprising that several Greek writers at different periods wrote large-scale histories, most notably the scholarly and perceptive Dionysius of Halicarnassus (late 1st century BC), who wrote 30 books (the first 11 survive), from the pre-foundation legends to 264 BC, and Cassius Dio of Nicaea in Bithynia (*c.*AD 164–after 229), a Greek-speaking senator and imperial *amicus*, who wrote a *Roman History* in 80 books, from the beginning to AD 229, of which nearly 24 survive complete, with excerpts and epitomes of the rest. Dio is an interesting combination of Greek and Roman ideas and culture – and historiography: he writes Classical Attic Greek, is much influenced by Thucydides (though he can be moralizing and rhetorical and, at times, too free in inventing speeches), and provides a perceptive analysis of the implications of the change from republic to principate, along with what is, in reality, a political manifesto suggesting solutions for the problems faced by the empire in the 3rd century AD (cf. Reinhold, pp.219–21).

Emphasis must also be placed on the sheer volume and diversity of the historiography of the Hellenistic period in

particular. Obviously, in a brief survey such as this, only a few of the many hundreds of names known to us can be mentioned. For example, there was a vast outpouring of historical works in the 2nd century AD, on which see the sardonic essay "How to Write History" by the contemporary Lucian of Samosata; see also Baldwin's discussion.

Byzantium and Tourkokratia

Byzantine historiography took three at first largely distinct forms: traditional histories of the "Classical" type, chronicles, and Church histories (hagiography, which began in 356/57 with the *Vita* of St Antony the Great attributed to Athanasius, may be considered separately since its primary function was spiritual edification; but it did overlap with historiography, both profiting from and contributing to chronicles in particular). The Byzantines themselves used the terms "history" and "chronicle" interchangeably with a growing preference for the latter. Moreover, in recent years most scholars have rejected their predecessors' simplistic and rigid division of historiography into, on the one hand, fairly reliable well-written histories by state officials for a sophisticated elite and, on the other, contemptible monkish chronicles catering for an ill-educated readership. Nevertheless, for early Byzantium it is convenient to treat the three forms individually.

The comparatively more settled conditions of the Greek-speaking East and the transference thither of the Roman court encouraged writers to continue the "Classical" form of history, which was usually geographically and chronologically limited in scope, often covering recent or even contemporary themes, and intended both to inform through content and to delight through style. Political and military subject matter dominated at the expense of the economic, social, and religious, although the last played a growing role in some pagan writings. Historians were interested in causation, ascribing events to either *tyche* (fortune) and, increasingly, divine providence, or to the actions and characters of the principals involved, whom they duly praised or censured (most notoriously in the salacious and vitriolic *Anecdota* or *Secret History* by the 6th-century historian Procopius). The East thus contrasted with the West, where the severe dislocation of society consequent upon barbarian assumption of power entrenched an already existing demand for simple epitomes of Roman history and biographical sketches (it is significant that the only "Classical" history in Latin since the 2nd-century history by Tacitus was written in the 4th century by Ammianus Marcellinus, a native Greek-speaker from Antioch). Even in the East, however, there was a break in the continuity of classicizing historical writing between Dexippus in the late 3rd century and Eunapius in the early 5th. Moreover, a liking for epitomes is indicated by the popularity of Greek translations of the late 4th-century breviary of Roman history by Eutropius.

The classicizing language of these historians became increasingly distinct from the commonly spoken demotic and explains why many were rhetoricians, sophists, or lawyers (e.g. Eunapius, Priscus, Malchus, Agathias). Nevertheless, again unlike in the West, many in the East were participants in or eyewitnesses of the events they described: Olympiodorus, Priscus, Nonnosus, and Peter the Patrician were ambassadors, while Procopius was secretary and legal adviser to the general Belisarius. Adherence to Classical forms, and especially to Thucydides, was variably tried and achieved. It included speeches, both heard and imagined by the writers. Set literary pieces, such as Procopius' descriptions of sieges and the plague in Constantinople in 542, were once subject to extreme scholarly suspicion, but are now generally regarded as true in essential facts despite borrowed Thucydidean details. While a few historians were indeed pagan (e.g. Olympiodorus, Zosimus, and Eunapius, the last so belligerently that according to Photios his work had to be re-edited less offensively), perhaps the most remarkable aspect of the classicizing tendency is an almost total avoidance by even Christian writers of Christian content. This led not only Byzantines to be uncertain about an historian's religious beliefs (Photios famously described Malchus as being "not outside the Christian faith"), but also some modern scholars who, to take one example, have erroneously interpreted Procopius' shunning of theological issues and preference for secular causation as evidence for paganism.

Both the other two forms of history – chronicles and Church histories – were the creations of Eusebius of Caesarea. The full title of *Chronological Canons with an Epitome of Universal History both Greek and Non-Greek* describes the scope of what is commonly called his *Chronicle*. Although lost, it is known through epitomes and redactions, most notably Jerome's partial but updated translation with many Western additions. First published in the late 3rd century and completed soon after its terminus in Constantine's Vicennalia (325), it draws upon a long history of Greek and biblical chronographic writing. Its first part (preserved only in an

Armenian version) comprises traditional lists of rulers and officials with occasional commentaries and summaries about each kingdom. The second part opens with three vertical columns giving respectively the rulers of the Hebrews, Assyrians, and Egyptians, the dates from Abraham being indicated in decades in the extreme left margin. Olympiads are added from 776 BC and the columns increase and decrease in number to accommodate the rise and fall of different nations (it ends with only two columns for Rome and Persia). Between these columns are added respectively to left and right facts of biblical and pagan history. Thus on an immediately intelligible grid Eusebius gave readers a synoptic and synchronistic world history designed as an apologia for the Judaeo-Christian tradition which is shown to predate the Roman empire.

As in the West so in the East Eusebius gave impetus to local annalistic chronicles such as the still extant Syriac *Chronicle of Edessa*; but, whereas Latin writers were usually content to compile continuations of Jerome's work, the Byzantines chose also to rewrite from the beginning. Moreover, in a lost redaction of the early 5th century Panodorus and Annianus pushed back this beginning to Adam, an innovation that is found in the earliest surviving Byzantine universal history, the chronicle of John Malalas which breaks off in 565. This work, though often criticized for its inaccuracies, is notable for much information on Antioch, frequent citing of sources, and use of the vernacular, which last enhanced its popularity (it was later translated into both Georgian and Old Church Slavonic). Malalas's work, which blithely ignores Periclean Athens and the whole period of the Roman republic from 509 to 44 BC, encouraged an increasing tendency in universal histories to emphasize biblical at the expense of Classical Greek and even Roman history, knowledge of which grew ever shakier.

Eusebius' *Ecclesiastical History* is at least in part consequent upon the widespread concept of Christians as constituting a nation that required its own history. First written before the triumph of the faith, it emphasizes the struggles along the preordained path to that triumph the consummation of which is found, in later revisions, in the reign of Constantine I, whose Christianity and piety are grossly exaggerated and whose sins are whitewashed to establish him as God's vicegerent on earth (Eusebius is responsible also for a highly eulogistic *Vita Constantini*). The work was ever after held as of great authority despite criticism of its Arian slant and rejection of the cult of images, which led to a prohibition of quotation from it by the Second Council of Nicaea in 787. Eusebius' most important early followers were the lawyers Socrates and the slightly later Sozomenus, and the bishop Theodoretus, whose works cover respectively the periods 305 to 439, 324 to 425 (Sozomenus' later material is lost), and 323 to 428. They were careful historians, Socrates even publishing a second edition of his history upon discovery that a major source (a Latin history by Rufinus of Aquileia) had serious chronological errors; and all follow Eusebius' important innovation of extensive quoting of documentary evidence, an innovation which encouraged emulation in many subsequent secular histories. Their three histories were influential also in the West, where in Latin translation they constituted the *Historia Tripartita*.

The Eusebian preoccupation with detailing the preservation of the Christian faith against pagan assaults is followed in his successors by their detailing the preservation of true doctrine against the assaults of heretics. With the resolution of fundamental doctrinal problems the raison d'être of ecclesiastical histories disappeared in the later 6th century, the last one of which was written by another lawyer, Evagrius Scholasticus. His account deals with the years 431–594 and is valuable for its extensive use of the archives of the Antiochene patriarchate and for its bibliography. Thereafter there is only the strange revival of the genre in the early 14th century by Nikephoros Kallistos Xanthopoulos before the religious conditions of the Tourkokratia once more justified apologetic histories of the Church. Socrates and Sozomenus had already in the 5th century mingled ecclesiastical and secular history, thus paving the way for the complete absorption of the former by the latter after Evagrius.

The end of the early period of Byzantine (or of late antique) historiography is marked by Theophylaktos Simokattes's account of the reign of Maurice (582–602) and the so-called *Paschal Chronicle* which begins with Adam and breaks off in 628. Already in Simokattes's work, however, it is clear how far Byzantine historians had come in their fusing of the discrete ancient genres of history, biography, and encomium (Plutarch became a more important model than Thucydides). The chronicle is largely derivative, but contains valuable and even documentary evidence for the reigns of Phokas (602–10) and Herakleios (610–41) and is the first surviving historical work to date the Creation to 21 March 5509 BC.

From the 7th century to the early 9th century virtually no historical writings have survived, partly because of the decline of learning and partly, it may be assumed, because of the neglect or destruction of iconoclastic works. Our knowledge of the intervening centuries is largely dependent upon two later writers. Theophanes the Confessor continued to the year 813 the unoriginal compilation of his contemporary George the Synkellos (*Selection from Chronographers*) which covers the period from the Creation to the accession of Diocletian (284); and the patriarch Nikephoros I wrote a popular compendious history of the period 602–709 which was later translated into Latin and various Slavic languages. Theophanes' annalistic history was continued in turn by a work of original composition (conventionally known as *Scriptores post Theophanem* or *Theophanes Continuatus*) originally commissioned and perhaps contributed to by the emperor Constantine VII and arranged as a series of imperial biographies designed to support the Macedonian dynasty. It is thus propagandistic history.

From the intellectual revival in the 9th century until the fall of Constantinople in 1453 Byzantine historiography shows great variety. This is becoming increasingly evident in the comprehensive re-evaluation by modern scholarship which finds new personal approaches in even the seemingly most mechanical collections of excerpts. Works vary from universal surveys through recitals of individual reigns or chronicles of individual cities to descriptions of single climactic events or studies of specific subjects (e.g. the works by Constantine VII on the ceremonies of the court, themes, and diplomacy); from largely unoriginal compilations and epitomes to carefully researched independent analyses; from bare and factual accounts to vivid depictions; from conventional assessments to perceptive psychological portrayals (most notably by Psellos); from simply written narratives (some chronicles even in the

vernacular and Leontios Machairas' 15th-century *Narrative of the Sweet Land of Cyprus* in Cypriot dialect) to productions on which has been lavished every resource of rhetorical artistry. Prose was the traditional vehicle, but in the 12th century Constantine Manasses innovatingly wrote a chronicle in 6733 15-syllable lines from Adam to 1081. Thereafter verse was chosen in the early 14th century by Ephraim for his history of the rulers of the Old and New Romes and for various anonymous vernacular chronicles (e.g. the *Chronicle of the Morea* on the Frankish occupation of the Peloponnese to 1292, which is possibly a translation of the French version (it exists also in Italian and Aragonese) or may itself be the original, and the *Chronicle of the Tocco* on the ruling family of Ioannina in the 14th to 15th centuries).

Most historians were participants in or at least eyewitnesses of some of the events which they described. Thus Constantine VII and John VI Kantakouzenos were emperors and Nikephoros Bryennios an unsuccessful usurper; among civil servants and diplomats may be numbered Psellos, Attaleiates, Zonaras, Glykas (later involved in a conspiracy and imprisoned), Kinnamos, Skylitzes, Niketas Choniates, Akropolites, Pachymeres, Machairas (at the Lusignan Cypriot court), Doukas, and Sphrantzes; Leo the Deacon took part in the expedition against Bulgaria in 986; Kaminiates (if the account is truly his) wrote on the Arab siege of Thessalonica in 904, while in the 12th century the city's archbishop and gallant defender Eustathios recounted its capture by the Normans in 1185; the Byzantine princess Anna Komnene was an interested observer and critic of the leaders of the First Crusade; Nikephoros Gregoras was deeply involved in the theological politics of his day; Niketas Choniates witnessed the sack of Constantinople by the Fourth Crusade in 1204, John Kananos its siege by Murad II in 1422, Sphrantzes its fall to Mehmet II in 1453.

Apart from the obvious advantages for an historian, this involvement in affairs encouraged a Byzantine intrusion of author into work rare in Greek antiquity: thus, for instance, Psellos exaggerated his own importance in affairs of state, while Kantakouzenos's principal aim was to convince posterity of the rightness of his actions in the civil war (with seeming ingenuousness he recorded lengthy criticisms of himself, but only with his own rejoinders). Various historians chose their subjects for openly professed reasons: thus Attaleiates wanted to immortalize the exemplary deeds and character of Nikephoros III Botaneiates (as Xenophon had those of the Persian usurper Cyrus), Anna Komnene to do justice to her imperial father's achievements. The 12th-century epitomator Kedrenos rightly saw fit to accuse predecessors of "failing in accuracy" through the wish of "one to praise an emperor, one to blame a patriarch, another to eulogize a friend". Although some historians sought to give posterity disinterested accounts, others saw themselves in moral terms, with a mission to lead their readers into "right thinking", whether political or religious, thereby unashamedly justifying prejudice (George Hamartolos, "the sinner", even allowed himself to indulge in obscenities to vent his hatred of iconoclasm, Islam, and Manichaeanism). Nevertheless, despite distortion, which is often merely the result of biased selection of material, and errors of fact due to ignorance, Byzantine writers did not tell deliberate falsehoods, for, as Pachymeres claimed, "truth is the soul of history" (although he did add that there are certain matters not meet to be known, in which cases "it is better for posterity to be ignorant than misinformed").

Byzantine historiography through most of its chronological span fully validates the claim often made for it as the most interesting genre of secular literature for range of factual information, revelations of values both personal and societal, innovative approaches, and variety of styles and linguistic registers.

Life under foreign rule enabled historians to broaden their vision, and so Machairas' chronicle has the added interest of a genuine admiration for the Lusignan kings combined with patriotism and Orthodox faith. The period immediately after the fall of Constantinople in 1453 had a similar effect. In the 1480s Laonikos Chalkokondyles, in clear imitation of Herodotus' study of the conflict between Persians and Greeks, traced the confrontation from 1298 to 1463 of the Byzantines and Ottoman Turks with pointed emphasis on the latter, for whom he was a valuable witness through his access to documentary sources. Michael Kritoboulos, who was governor of Imbros from 1456 until its fall to the Venetians in 1466, went even further in a history of the period from 1451 to 1467 which is stylistically and linguistically modelled on Thucydides: his hero was his master Mehmet II, whose position as successor to Byzantine emperors is validated by an interest in Classical antiquity.

Thereafter, with the death of the generation educated traditionally before the fall, there was virtually no literature in areas under Turkish rule until the late 16th century. Even after the patriarch Cyril I Lukaris (1620–38) established in Constantinople the first printing press in the Greek world, historical writing remained a hazardous genre to pursue. Elsewhere in the old Byzantine world (mainly Cyprus, Crete, and, from the 17th century, the Ionian islands) historical works continued to be written, but at first almost exclusively in verse and in some variant of the vernacular. Members of the diaspora had initially few historiographic interests, but of crucial importance was the pioneering work of the Corfiote Nikolaos Sophianos and others in the mid-15th century in encouraging a belief in the vernacular as a respectable language for intellectuals to employ even in prose, although many still preferred to write in the high language or even in Italian (Sophianos even wrote a demotic grammar, which was not, however, published until 1870).

In Cyprus Georgios Boustronios usefully but less dramatically continued Machairas' prose chronicle up to 1501, but the island's promise to produce an indigenous literary tradition was stifled by the Turkish seizure in 1570, although this initially inspired several historical poems reminiscent of those lamenting the fall of Constantinople (and an eyewitness account by Ioannes Sozomenos in Italian of the Turkish siege of Nicosia at which he was taken prisoner). Indigenous Cretan historiography lasted longer. The earthquake of 1508 and its devastating consequences are the subject of a vivid poem by Manoles Sklavos, while the struggle over the island between the Venetians and the Turks from 1645 to 1669 is detailed in lengthy poems by Athanasios Skleros (unusually in the high language), Anthimos Diakrouses, and (the most vivid) Marinos Bouniales. Emmanuel Georgillas of Rhodes contributed a short poem describing the plague of 1498–1500, but its style is dry and its purpose religious edification. The most interesting of

the products of the Ionian islands is the detailed, vivid, but critical description of the popular uprising of Zakynthos against the Venetians in 1628, by Antzolos Soummakes. Certain other works, such as the poem on the siege of Malta in 1565 by the Cretan Antonios Acheles, are merely adaptations of Italian originals.

Local patriotism was sporadically kept alive by chronicles, of which the most interesting is the vernacular *Chronicle of Galaxeidi* composed in 1703 by the monk Euthymios. This charming medley of historical facts, miracles, and fantastic tales describes the history of a village on the northern shore of the Corinthian Gulf from the Byzantine period. For many years the only source of information on general Greek history was the universal chronicle attributed to the perhaps fictitious Dorotheos of Monemvasia. This is an enormous medley of disparate sources, some now lost, and includes lists of Roman, Christian, and Turkish rulers, an account of the Council of Ferrara-Florence, and a section on Venice. Its earliest redaction ends in 1570. By the early 19th century, however, there had been published, often in Italy, not only numerous compilations, adaptations, and partly original works of varying merit but also translations of several foreign histories of Greece (including that by Oliver Goldsmith), and even one of Byzantine historians rendered into a more modern idiom (by Ioannes Stanos in 1767).

Roughly contemporary with the *Chronicle of Dorotheos* is a vernacular *History of the Patriarchs of Constantinople* (this and a universal chronicle are attributed to a Manuel Malaxos who for the latter may have been only the copyist), which was of sufficient merit to warrant publication in 1584 by the German scholar Martin Crusius. Knowledge of their counterparts in Jerusalem was added in an adversely critical 17th-century account by Païsios Ligarides, a man of shifting and dubious religious loyalties (it was used later by the far more reputable and scholarly Dositheos, himself a patriarch of Jerusalem). Useful material on the negotiations of the ecumenical patriarch Jeremias II is to be found in the verse chronicle of his journey to Jerusalem by archbishop Arsenios, written in 1620. Most notable, however, because it can be truly classed as a work of scholarship, is the *Summary of Religious and Profane History* by one of the pioneers of the Greek intellectual renaissance, the Cretan Nektarios who became patriarch of Jerusalem in 1661. A preliminary section based upon the Old Testament is followed by a lengthy history of the monastery of St Catherine, Sinai, for which Nektarios used Arab sources and monastic manuscripts, before adding sections on the history of Egypt, based upon Herodotus and later sources, and the conquest of Egypt by the Ottoman Selim in 1517. Quite different, and analagous to local chronicles, is a lively 17th-century anonymous history of the Athonite monastery of Vatopedi. Of the numerous later ecclesiastical works the most notable is the *Memoirs of Ecclesiastical History* of Sergios Makraios, professor at the Patriarchal School in Constantinople, which gives valuable information on Orthodox-papal relations in the period 1750–1800.

Greek historical interests naturally extended only exceptionally beyond the Mediterranean world (the early 16th-century Corfiote Jakobos Triboles's poem, *The History of the King of Scotland and the Queen of England*, has nothing to do with any personages of those countries, since it is merely a reworking of a tale in Boccaccio). Of peculiar interest, therefore, is a work in Latin by the mercenary soldier Jakobos Basilikos (who gave himself the surname Heraklides and became prince of Moldavia in 1561): his eyewitness account of the campaign of Charles V at Thérouanne and Renty takes the form of a dialogue between Hercules and Nestor. In the 18th century Chrysanthos Notaras's account in the vernacular of the Tatar conquest of China is indicative of the growing internationalism of the Greeks of the disapora, while various works on Russia indicate that country's involvement in Greek affairs. Histories of Wallachia and Moldavia (notably by Kaisarios Dapontes, the finest Greek historian of the 18th century, and, later, Dionysios Photeinos) reflect Phanariot Greek rule there.

The earliest history of the Ottomans by a Greek (after Chalkokondyles and Kritoboulos) is the anonymous late-16th-century vernacular *Chronicle of the Turkish Sultans*, which is, however, based upon an Italian original. The first work of some independent merit is the history, in Italian, of Theodoros Spandounes who fought at the siege of Vienna in 1532. Probably through Italian influence he not only shows himself aware of Greek faults (e.g. their theological quarrels) but demonstrates an interest in Turkish customs. By far the best Ottoman history written by a Greek was that of the Phanariot Demetrios Kantemir (his father was of Tartar origin), who became Prince of Moldavia in 1710: it was little known, however, to his fellow countrymen since it was written in Latin and published in an English translation. Apart from accounts of and lamentations on Turkish victories already mentioned, the Ottoman and Venetian wars were another topic of interest, as in the anonymous 17th-century *Chronicle of Matesis* and Laonikos Zamires' celebration of a Venetian naval victory in 1651. Of greater interest, however, are the works of Christophoros Angelos. As a teacher of Greek at Oxford and Cambridge, Angelos chose the Classical language for a vivid account of his sufferings at the hands of the Turks (1617) and an analysis of the contemporary situation of the Greeks which includes a history of the Greek Church (1619).

The obviously fading power of the Turks from the late-17th to the early-19th century encouraged a Greek consciousness. Indicative of this is a history of Athens from Cecrops to Dionysius the Areopagite which the learned Georgios Kontares deliberately published in the vernacular (Venice, 1675) to inspire the common people. Even the Cretan Nikolaos Komnenos Papadopoulos's Latin *History of the University of Padua* (1726) emphasizes its Greek students, while the dedication of Alexandros Kankellarios's translation of Charles Rollin's *Ancient History* (1750) is to "the famous nation of the Greeks" who will thereby learn of their "glorious past". Local pride is evident in a continuing series of local histories of Athens, Corfu, Cyprus (a major work of scholarship published in 1788 by the archimandrite Kyprianos Kouriokourineos), and Epirus. Also suggesting the perceived need to emphasize a pre-Ottoman history is the vernacular translation of the surviving 15th-century *Chronicle of Ioannina*, itself an important souce for knowledge of medieval Epirus. Contemporary wars between Greeks and Turks were also at last a source of inspiration: most notable are the *Lament of the Peloponnese*, a poem in 2700 rhymed hendecasyllabics of real literary merit by Petros Katsaïtes on the events of 1715; and the *History of Souli and Parga*, a prose account of the Souliots' struggles with Ali

Pasha published by Christophoros Perraibos in 1803. Finally, the Greek War of Independence proper begat an outstanding work in the *Memoirs* of one of its major figures, General Makriyannis, composed after the war's conclusion when he had taught himself to read and write. Although ignored until its publication in 1907, and then despised for some 30 years, its idiosyncratic nature (replete with bizarre spelling and punctuation), vehement expression, and enthralling narrative offer a fitting culmination of the vernacular tradition of the Tourkokratia and Frankokratia which was now driven underground by the katharevousa ("purified" language) of other historians.

Modern

In the prerevolutionary period of the so-called Neohellenic Enlightenment (1750–1821) the writing, publishing, and dissemination of historical works, whether originals, adaptations, compilations, or translations, formed a major contribution to the ideological and cultural preparation for the raising of national awareness among the Ottoman-ruled Greeks. With the successful outcome of the Greek ethnogenesis, realized in the form of a truncated but independent nation state, historical writing was to evolve in the context of Greek national ideology, echoing the national assumptions of the Greek state, aspiring to establish a legitimate European profile through a historical past and to carry out its liberating mission in the unredeemed Greek-populated lands of Ottoman Turkey.

The first phase of modern Greek historiography spans the first 90 years of free statehood, to Greece's military defeat in Asia Minor in 1922. Not surprisingly, in the early decades (1830–60) historical works on the late prerevolutionary period and, particularly, on the War of Independence were mostly produced by contemporaries of and participants in the events. These consisted of general histories (A. Frantzis's *History of Reborn Greece*, and the 4-volume histories of the revolution by S. Trikoupis and I. Filimon), the memoirs and reminiscences of participants (Palaion Patron Germanos, N. Kasomoulis, T. Kolokotronis, E. Xanthos, C. Perraivos, F. Chrysanthopoulos-Fotakos, N. Spiliadis, Spyromilios), collections of documents and laws (A. Mamoukas), biographies, and various monographs.

Revolutionary Greece was also recorded by contemporary European writers and historians (G. Finlay, T. Gordon, G. Gervinus, F. Pouqueville, F. Thiersch, J. Zinkeisen, and A. Prokesch-Osten). Otherwise, 19th-century Hellenism attracted contemporary foreign historiographic interest either in connection with the complex diplomatic context of the Eastern Question and Ottoman Turkey's difficulties with reform, or as travel literature. With few exceptions (G. Finlay, K. Mendelson-Bartholdy, G. Hertzberg, P. Bickford-Smith), it was the arrival of the 20th century that produced the first major works on modern Greek history by European historians, such as William Miller and E. Driault and M. l'Héritier, whose classic diplomatic history of Greece from 1821 to their times remains in use. European scholarship paid greater attention to medieval and Frankish-ruled Hellenism, partly by the same historians (G. Finlay, G. Hertzberg) along with the medievalists Karl Hopf and J.A. Buchon, while in 1908 William Miller contributed a history of Frankish Greece (1204–1566).

The main themes of 19th-century Greek historiography were shaped by the dominant questions of modern Hellenism, namely historical continuity as an ingredient of the Greek national identity, and the Great Idea as the foremost vision of national integration in its hallucinating dimensions of creating an eastern empire of the Greeks with a capital at Constantinople. The role of the German historian Jacob Philipp Fallmerayer, however unintended and repugnant to the Greeks, was to be seminal, when in his History of the Morea during the Middle Ages (*Geschichte der Halbinsel Morea wahrend des Mittelalters* 2 vols, 1830 and 1836), he dissociated, on a racial basis, modern Greeks from their esteemed ancient ancestors, in the belief that the latter were entirely replaced by an amalgamation of Slavic tribes – a theory opposed at once by such European contemporaries as J.W. Zinkeisen and B. Kopitar. His thesis was felt as a national affront, and provoked a large number of ad-hoc history books and articles in Greece to oppugn it and, thus, restore national self-esteem and establish credentials of historical legitimacy at home and, especially, in the eyes of the West (e.g. *Refutation of the Theories of Fallmerayer* by F. Zamvaldis, *On the Descent of the Race of the Greeks* by C. Poulios, etc.). On academic historiography, in particular, such ideological assumptions weighed heavily, with the Faculty of Philosophy at Athens University (founded 1837) assuming throughout the century a leading role in the elaborations of Greek nationalism. This is where the official national theory of the historical continuity of

Hellenism was formulated – the Greek variant on the similar theme of European nationalism.

Konstantinos Paparrigopoulos (1815–91), a university history professor, was the intellectual who provided the definitive contemporary answer on behalf of Greek historiography on the question of the historical unity of Greek culture in time and place. This he pursued by expounding the concept of a historical continuum from Homeric Greece to modern times through the rehabilitation in the national consciousness and history writing of the hitherto disparaged (by the classicist Enlightenment) medieval Byzantium. Its full elaboration was formulated in the final version of his monumental *Istoria tou Ellinikou Ethnous* (History of the Greek Nation, 1860–74), a work setting a model for Greek history writing for more than a century, both in terms of methodology as factual historical narrative and, primarily, in conceptualizing and establishing in Greek historiography the genuinely lingering pattern of the history of the Greek nation per se.

The discourse that was generated in Greek scholarship over Hellenism and its relationship with Byzantium confirmed the establishment of the tripartite pattern of Greek history from ancient times through to the formation of the Greek state. In 1852 Spyridon Zampelios gave prominence to the Byzantine period and associated it with the Greek consciousness in the *Historical Study on Medieval Hellenism* which prefaced his collection of Greek demotic songs. Five years later he published his *Byzantine Studies*. That the Byzantine period aspired to and was integrated into the scope of historiography as a legitimate, in fact value-imparting, constituent paved the way for the development of Byzantine studies in Greece, along with the unchallenged Classical studies, accredited from the outset by virtue of the underlying classicist values of the Greek state. The political conditions from the last decades of the century onwards encouraged these studies, as the rise of Slavophobia in Greece found ground for confirmation in the study of Byzantium. This was further strengthened by the sharpening of national feeling and the presence of the spirit of an eastern empire among intellectuals before and around the time of the Balkan Wars – a growing trend illustrated by the immediate translation of Karl Krumbacher's bulky *History of Byzantine Literature* (1897–1900), the four-volume comprehensive publication in Greek of the French Byzantinist Gustave Schlumberger's works under the title *Byzantine Épopée* (1904–08), and K.S. Sokolis's book *Empire* (1916). On the whole, 19th-century political and cultural Romanticism, emphasizing the notion of the nation and its historical lineage, prompted the growth of historical studies and, especially, interest in research and the publication of primary sources. In this, folklore, founded by Nikolaos Politis (1852–1921) as a self-sufficient academic discipline under nationally orientated auspices, provided extra material on Greek popular culture and life.

Throughout the 19th and the early 20th centuries the Paparrigopoulos legacy determined the course of Greek historiography, since the national ideological and cultural underpinnings remained by and large unmodified. In particular, the term Hellenism, denoting the presence of the nation far beyond and irrespective of "the narrow precinct of free Greece" (Paparrigopoulos), was universally espoused by the 1880s, partly in place of the Great Idea, which at times provoked distrust and a critique. Spyridon Lambros (1851–1919) and Pavlos Karolidis (1849–1930), both history professors at Athens University, continued along the lines of the national historicist school, contributing much to Greek historiography. The former dealt extensively with medieval and modern Hellenism, his rich historiographic output including a history of Greece to 1453, while as editor of the historical journal *Neos Ellinomnimon* he worked for the advance of historical studies, with emphasis on source-material publishing. The latter, Karolidis, whose work ranged from national to world history, wrote *inter alia* a history of Greece from 1453 to 1863, and complemented Paparrigopoulos's *History* with an account of the period from independence to 1930. In the same spirit, Epameinondas Kyriakidis (1861–1939), a Constantinopolitan scholar, published a *History of Contemporary Hellenism* (19th century). In addition, Konstantinos Sathas (1842–1924), a dedicated, albeit non-professional, historian, researched and wrote on Ottoman-ruled Hellenism, leaving behind informative books, notably his voluminous *Medieval Library*, *Turkish-dominated Greece*, and biographies of Greek scholars (1453–1821) in his *Neohellenic Literature*.

Of other noteworthy writers and historians, Antonios Miliarakis (1841–1905) was attracted to the history and geography of medieval Greece, but it was Pavlos Kalligas (1814–96) who was among the first after Paparrigopoulos to examine Byzantine Hellenism. Tryfon Evangelidis (1863–1941) dealt *inter alia* with the Tourkokratia and the education of Ottoman-ruled Greeks, while Manouil Gedeon (1854–1943) centred on the history of the Constantinople patriarchate and ecclesiastical matters. In the field of local and regional historiography, besides Andreas Moustoxydis (1785–1860), the groundbreaking historian who continued the exploratory historical work he had started as early as 1804, Panagiotis Chiotis (1814–96), and Andreas Idromenos (1853–1917) occupied themselves with the history of the Ionian islands; Dionysios Sourmelis and, later, Themistoklis Filadelfevs (1838–1920) and Dimitrios Kampouroglou (1852–1942) looked into medieval and modern Athens; the archaeologist and philologist Stefanos Xanthoudidis (1864–1928) wrote a history of Crete; Ioannis Lampridis (1862–1914) published work on Epirus and the Hellenism of Egypt, while others worked on the Peloponnese (C. Korylos) and Thessaly (N. Georgiadis); and, finally, Alexandros Paspatis (1814–91), another writer from Constantinople, left behind many studies in the history of his birthplace. Other 19th-century writers such as A. Mansolas, I. Nouchakis, and I. Stamatakis showed interest in the historical geography and demography of Greece. As regards economic history, after A. Vernardakis, D. Georgiades, and L. Dosios, who wrote economic monographs, Andreas Andreadis (1876–1935), university professor of political economy and finance, laid the scientific foundations of economic history in Greece by writing a history of Greek loans and public finance.

The year 1922, a watershed in Greek history marking the end of the Great Idea as an irredentist vision, marked the opening of a second period of historiography extending to the 1960s. The trend towards reorientation and revision in the Greek national consciousness in the interwar period, and an ideological divergence in place of the unitary effect of the Great Idea, had some repercussions on historiography. Renewal and

challenge were introduced methodologically by the Marxist approach and thematically by a sensitivity towards social issues. These developments were accelerated by the formation of the Communist Party, and the increase in social awareness and tensions after Georgios Skliros wrote *Our Social Question* (1907). Marxist historiography was represented by Gianis Kordatos (1891–1961), the first Communist Party leader and an indefatigable historian, who as early as 1924 attempted a class analysis of the Greek revolution, and produced pioneering work on the history of Greek capitalism and of the Greek agrarian and working-class movements. Another communist writer, Serafeim Maximos (1895–1962), turned to the economic history of Greece. The agricultural question in the country was broad-sightedly discussed by K.D. Karavidas in a remarkable book, *Agricultural Issues* (1931), while D.L. Zografos dealt extensively with the history of Greek agriculture. Conventional history writing was not seriously affected, however, since the rise and establishment of Greek authoritarianism, following the brief republican interlude in the interwar period, prevented new historiography from amending the traditional theoretical framework of Greek history. This annulled, too, an early attempt in Greek history studies to overcome their ethnocentric interests: in 1939 the state abolished the chairs of Balkan, Slav, and Arab history and literature for which provision had been made at the recently established Thessalonica University (founded 1926).

In the field of the traditional historiography of modern Hellenism, the following should be mentioned. Nikolaos Vlachos (1893–1956) and Georgios Aspreas (1875–1952; the political history of modern Greece), Dionysios Kokkinos (1884–1967; the Greek revolution), Giannis Vlachogiannis (1868–1945), Kostas Kairofylas (1878–1961), Fanis Michalopoulos (1895–1960), and many others. Xenophon Zolotas (born 1904) partly continued Andreas Andreadis's work, but orientated towards pure economics, producing books on Greece's industrialization and monetary stabilization. Balkan studies owe a great deal to Michail Laskaris (1903–65), the founder of Balkanology in Greece, and Byzantine studies to Byzantinist professors at Athens University, Konstantinos Amantos (1874–1960), Nikolaos Veis (1887–1958), and, throughout the period since World War II, Dionysios Zakythinos (1905–93). Research into Byzantium and medieval studies were early encouraged by the Society for Byzantine Studies and the Society for Medieval Literature, founded in 1918 and 1926 respectively.

The third period of Greek historiography, representing an apogee of historical studies, traces its origins to around the 1960s and manifested itself clearly from the 1970s onwards. It originated with Greek historians abroad, especially in the United States and France, who because of their position were receptive to major developments in international historiography, to which the prevailing post-Civil War climate of ultra-conservatism in Greece remained obstinately immune. It was with the restoration of democracy in 1974 and the ensuing radicalization that conditions were created for the reassociation of Greek scholarship with European intellectual trends, and for history writing and research in the country to flourish.

On Byzantine Hellenism, besides domestic historiographic production, there was already a longer tradition of study in international scholarship to build upon, respectably established by Gustave Schlumberger, Henri Grégoire, Charles Diehl, and more recently Franz Dölger, Alexander Vasiliev, Georg Ostrogorsky, and Romilly Jenkins (followed by S. Vryonis, S. Runciman, D. Obolensky, A. Kazhdan, P. Lemerle, N. Oikonomides, H. Ahrweiler-Glykatzi, D. Geanakoplos, I. Karagiannopoulos, E. Barker, H. Antoniadis-Bibiacou, H.-G. Beck, H. Hunger, D. Nicol, A. Guillou, P. Charanis, and I. Shevchenko). The difference was made far more evident in the field of modern Hellenism, where several leading historians are numbered among those who initiated from abroad the renewal of Greek historiography, such as Lefteris Stavrianos (*The Balkans since 1453*, 1958), John Petropulos (*Politics and Statecraft in the Kingdom of Greece*, 1968), and John Campbell (*Honour, Family and Patronage*, 1964), to name only three from both sides of the Atlantic. But two figures left an indelible imprint on modern Hellenism not merely by their historiographic production, but particularly by providing instruction and inspiration to an unconventionally minded younger generation of historians, namely Konstantinos T. Dimaras (1904–92) and Nikos Svoronos (1911–90), both intellectually influenced by the academic climate in France. Dimaras explored fresh historical ground by focusing on intellectual history with reference to the Neohellenic Enlightenment, while Svoronos, covering a broad range from Byzantium to modern history, sharpened methodologically the approach to social and economic issues. His *Histoire de la Grèce moderne* (1953), the first Marxist-slanted short history of Greece, became a standard work along with Richard Clogg's *Short History of Modern Greece* (1979).

The true renewal of Greek history writing has manifested itself in four respects: in numbers, since there has been an unprecedented increase in historians, history-related institutions and research centres, and historical publications in recent decades; in methodology, either by the introduction of different approaches, with an emphasis on those of broadly interpreted neo-Marxism and on a belated introduction of the French school of the *Annales*, or by interdisciplinary applications, especially from the field of social anthropology, political science, and historical sociology; in themes, marked by a burgeoning of monographs in long-neglected social and economic history, as well as in intellectual history and the "history of mentalities", the latter echoing a strong association with academic developments in France; and in periods, where the research focus has been set on modern Hellenism, especially on the 19th and 20th centuries, including the turbulent decade of the 1940s.

The historiography of this current period has given rise to the exploration of new phenomena such as underdevelopment and dependence in a European context, nationalism, state-building, the identity-formation process, diaspora, and ethnic groups. The social issue in Greek history has received scholarly attention, and the term "society" increasingly elbowed out in analyses that of the "nation"/*genos* (race). The old question of the identity of Hellenism has been freshly addressed, not in the traditional manner of the moulding of its distinct character, but in its dynamic historical perspective and interaction with the West and East in a scheme of cultural pluralism. Emphasis has been given to the horizontal study of historical periods rather than to the diachronic view of history derived from the Paparrigopoulos framework. Symptomatic of this, too, has

been an unorthodox trend in the study of Byzantium, especially abroad (in the works of Cyril Mango, for instance), as a phenomenon unrelated to modern Hellenism. In parallel, traditional history writing has been represented by two multivolume works: Apostolos Vakalopoulos's *History of Modern Hellenism* (Thessalonica, 1961–74), an updated and informative account of Hellenic continuity on the lines of Paparrigopoulos's work, and Spyridon Markezinis's *Political History of Greece, 1828 to 1975* (Athens, 1966–78). Finally, the *History of the Greek Nation* (1977), a 15-volume collective work, despite the traditional overall concept, reflects the results and pursuits of contemporary Greek historiography, standing out as the best encyclopaedic review of Greek history from ancient times to 1941.

Today Greek historiography exhibits a methodological and thematic pluralism and aspires to open communication with international history, while it continues its efforts to come to grips with the problem of traditional ethnocentricism. An indication of this can be seen in the Greece-related theses of the overwhelming majority of Greek graduates pursuing higher degrees in history in European and American universities.

Homer

Epic poet of the 8th or 7th century BC

"Homer" is the name associated since ancient times with the author of the *Iliad* and the *Odyssey*, the two epic poems that form the earliest surviving Greek literature and which are probably the most important and influential works ever written in Greek. The *Iliad* describes the Trojan War, the ten-year struggle by the Greeks to conquer the city of Troy in Asia Minor and to recapture Helen, the queen of Sparta who was abducted by the Trojan prince Paris. The poem covers only a few days in the last year of the war, when Achilles, the greatest of the Greek heroes, is insulted by Agamemnon, his commander in chief, and refuses to fight. The Greeks are badly defeated in his absence and plead for his help, but he gives it only when his close friend Patroclus is killed by Hector, the bravest of the Trojan princes. At that point Achilles returns to the battle and kills Hector, though he knows that he is fated to die if he does so. Hector's family mourns him greatly, and his aged father Priam, the king of Troy, comes to Achilles in secret to ransom his son's body, which Achilles allows him to do. These events are influenced but not entirely controlled by the gods, who take an active interest in the course of the war but are far from united in their aims and often engage in highly undignified bickering. The theme of the poem is the wrath of Achilles; it begins with the actions that caused that anger and ends when Achilles lays aside his anger to share Priam's grief, and the story is amazingly cohesive and unified for a poem of such length. Nevertheless the poet also manages, by means of well-placed digressions, to give the story of the entire war in the course of the poem.

The *Odyssey* takes place after the end of the Trojan War and chronicles the homeward journey of Odysseus, one of the Greek heroes. It begins towards the end of his wanderings, and we learn of many of his adventures only when he narrates them himself in the course of his homecoming; narration from various characters also provides us with the story of the part of the Trojan War between the end of the *Iliad* and the beginning of the *Odyssey*. The poet focuses not only on Odysseus and his adventures, but also on the courage and endurance of his wife Penelope, who waited 20 years for her husband to return, and the coming of age of their son Telemachus, who grew up without knowing his father. Both Penelope and Telemachus suffer from the crowd of suitors who occupy their house for years insisting that Penelope remarry, and the poet carefully alternates scenes describing their plight with ones detailing Odysseus' adventures. Finally the two halves of the poem come together, as Odysseus returns to his family and kills the suitors.

A number of shorter poems about the gods, known as the Homeric Hymns, are also attributed to Homer. Internal linguistic evidence suggests that some of these poems are almost as early as the *Iliad* and *Odyssey*, while others were clearly composed much later.

Nothing is known for certain about Homer himself, and his very existence is now disputed; the *Iliad* and *Odyssey* may have different authors, if either can be said to have an author at all. The epics are certainly the product of a long oral tradition, probably dating back at least to the 12th century BC. The extent to which this tradition can be taken as any sort of

Homer: an 18th-century engraving in the style of an ancient portrait bust

record of actual events in the Mycenaean period is disputed; archaeologists since Heinrich Schliemann have tended to identify Troy with the site of Hissarlik in Turkey, which could have been destroyed by the Greeks around 1250 BC (one ancient date for the Trojan War), but many of the episodes in the poems are certainly fictional and most are probably so. Only a few place names and descriptions of objects can be traced with certainty to the Mycenaean period, and most of the material in the poems is of much later date.

The oral tradition that produced the epics went on evolving until they were written down, which cannot have been earlier than *c.*800 BC and may have occurred a century or more after that. Today the name "Homer" is often conventionally applied to the last bard in the series (not necessarily the same person for both epics), who presumably shaped the poems into the form in which they were first committed to writing. It is uncertain how much of the final product can be attributed to his individual genius and how much to that of his predecessors. The result of this long evolution is that the language of the *Iliad* and *Odyssey* is a mixture of dialects from different centuries and different areas of Greece; it preserves traces of very archaic features next to relatively recent innovations and is not something that was ever spoken as anyone's natural language. Because of the prestige of the poems, however, the "epic dialect" became a recognized form of literary Greek and was often used, in whole or in part, for later Greek poetry.

Throughout antiquity the Homeric epics were regarded as indisputably the best and most important works of Greek literature, a reputation that they have never really lost. Greek schoolchildren studied them, in preference to all other literature, from the beginning of Greek schooling, and the epics were regularly recited on all kinds of occasions both public and private. Once they had been written down, the poems stopped evolving as oral literature and attained a relatively fixed form; this was necessitated in part by their use as an authority on any matter they mentioned, from territorial claims to religious observances. The poems' depiction of the gods as not free of human vices occasioned some discomfort among later philosophers, but not enough to undermine Homer's authority seriously.

Virtually all of ancient literature is indebted to Homer in one way or another; his influence is particularly notable in poetry, since both the language and the mythological material of much Greek poetry are directly traceable to him, but it can also be seen in historical and philosophical works. Some later Greeks, such as Apollonius Rhodius, wrote epics of their own that were close imitations of the Homeric poems, but most writers tended to feel that Homer could not be equalled and therefore should not be directly imitated. Much of ancient art is also clearly dependent on Homer for inspiration.

Homer was the first Greek author to be the subject of scholarship; legend has it that the 6th-century BC Athenian tyrant Pisistratus first ordered that a proper edition of the Homeric poems be compiled. This legend may be without foundation, but it is certainly true that in the Hellenistic period the great scholars of Alexandria devoted much time and energy to editing and commenting on the text of Homer, and many of their observations are still valuable today. Similarly, the enormous preponderance of Homer papyri (ancient copies of the Homeric poems on papyrus, found primarily in Egypt) over those of any other author shows that ancient scribes spent vast amounts of time copying the *Iliad* and *Odyssey*. Early quotations of Homer by other writers suggest that before the Alexandrian period there were a number of variant texts of Homer. This impression is borne out by the earliest Homeric papyri of the Alexandrian period. During that period, however, the papyri reveal the adoption of a standardized text: from about 150 BC virtually all papyri reflect a text very similar to that of the medieval manuscripts on which our own texts are based. Thus in some way the poems became codified during the Alexandrian period, though it is not clear whether this codification was entirely the work of scholars (many of whose emendations do not appear in the codified text) or whether it was also due to the changing practices of Alexandrian book copyists.

In the Roman and Byzantine periods the Homeric poems continued to be read, copied, quoted, imitated, and prized above other pagan literature, and with the introduction of Christianity their status was only slightly diminished. The popularity and importance of the epics made it impossible for

the Christians to condemn them, and for the most part the pillars of the Church read and used Homer quite happily, although for some the poems' incompatibility with Christian doctrine remained a problem. Several Byzantine authors, such as Tzetzes (12th century) and Psellos (11th century), solved this problem by writing allegorical interpretations of the poems and giving them Christian meaning; in so doing they joined a long tradition of Homeric allegorization that dates back to the Hellenistic period. School curricula in Byzantine times still contained a large component of instruction in and memorization of Homer, and ability to quote from the poems from memory was considered essential in an educated man. Byzantine scholars also produced numerous works on Homer, including the 12th-century archbishop Eustathios' massive commentaries on both epics, which are still of use today. Homer also influenced many vernacular authors of the Byzantine period.

In less educated circles, however, the enormous difference between the epic dialect and the spoken Greek of later periods made the poems more and more difficult to understand, and over time their plots became less familiar to the populace as a whole. Meanwhile, of course, the Homeric poems had been imitated by Latin poets, who in turn inspired medieval poets in western Europe. One result of this was the *Roman de Troie*, a 12th-century French poem on the Trojan War that adapts the Homeric characters into a framework of medieval Christianity, chivalry, and courtly love to the extent that they and their stories are barely recognizable. This poem was brought to Greece by Frankish occupiers and in the 14th century was translated into vernacular Greek as the "War of Troy". It is now the longest surviving medieval Greek vernacular poem (14,367 lines).

With the fall of Constantinople in 1453 the Greeks' contact with their literary past was greatly diminished, but the Homeric poems continued to be used as school texts in those schools that offered training in Greek (particularly those in the Greek diaspora) and so were as influential as any work of ancient Greek literature during this period. The prestige that they continued to hold is illustrated by the story of the reception of a French general sent by Napoleon to annex Corfu in 1797; after the general had delivered a learned speech sprinkled with references to Classical literature, the Corfiots handed him a copy of the *Odyssey* and replied that although the Greeks were not learned they should still be respected because of Homer. At the liberation of Greece in the 19th century Greek education became more widespread, and with it the Homeric poems, which were still used as school texts. They are in fact still so used to this day, continuing an impressive and unbroken tradition of two and a half millennia of Greek education.

The gap between Homeric Greek and the living language has continued to widen, however, resulting in a need for translations. As early as the 17th century Nikolaos Loukanis produced a paraphrase of the *Iliad* in modern Greek, but the first true modern Greek translations were not completed until Polylas's work in the late 19th century.

Modern Greek literature is almost as heavily influenced by Homer as that of the ancient world. The early poets of modern Greece wrote works clearly shaped by Homer, though not always directly alluding to him (e.g. Kalvos, 1824, and Solomos, 1825). Among more recent writers, Cavafy makes indirect use of Homer, while Seferis quotes and refers to the ancient epics frequently. Because of the location of Troy in Asia Minor, the Homeric poems have sometimes been seen as bearing on the modern struggle between Greece and Turkey; for this reason they had more influence on contemporary poetry before 1922, when the Greek army was defeated in Turkey and the Greeks living in Asia Minor were forced to relocate to mainland Greece, than immediately afterwards. Even today, however, Greek literature remains overshadowed by the Homeric poems and their enormous influence on the Greek language and literary tradition. As the poet Elytis put it (1970): "I was given the Greek language, a poor house on Homer's shores."

Biography

Homer is traditionally assumed to be the author of the two epic poems which represent the earliest surviving examples of Greek literature, the *Iliad* and the *Odyssey*. Based on a long oral tradition, the poems were not written down before 800 BC (and possibly a century or more later); the name "Homer" is conventionally applied to the last bard in that tradition before the poems were committed to writing. All subsequent Greek literature is indebted to Homer in some way.

Homosexuality

Homosexuality and the Hellenic tradition are bedfellows of long standing. The gay man or lesbian is no longer the "woman trapped in a man's body" or "the man trapped in a woman's body"; but we are no nearer agreement on what "homosexuality" is than we are able to accept the diversity it represents. Social constructionists argue that no sexualities exist outside culture – that indeed the very concept of "sexuality" is a product of our modern scientific-rational culture; the essentialists proclaim that there is something that "essentially" makes people homosexual, it is a "natural fact". With these two views unreconciled, it is clear there is no one "homosexuality". First, male and female homosexuality must be recognized as different experiences and expressions. Secondly, "homosexuality" is a category of meaning that shifts through time, and it is simplistic to reduce all male homosexual activity to anal intercourse. Homosexuality embraces the homosocial as well as the homoerotic. David Greenberg's masterful survey of the field has pointed out the variety so glibly united in the term "homosexuality". Greenberg's categories are useful in analysing the three broad periods of homosexuality in the Hellenic tradition: the Classical, the medieval, and the modern.

Classical

Sappho provides some evidence of female homoeroticism if not homosexuality:

> and you were anointed with
> a perfume, scented with blossom
> ... although it was fit for a queen
> and on a bed, soft and tender
> ... you satisfied your desire ...
>
> no. 32 (LP 94) in Sappho, *Poems and Fragments*, translated by Josephine Balmer

Clearer evidence from the Classical period is largely restricted to male homosexuality. For Greenberg the homosexuality of Classical Athens – subject of a definitive study by Kenneth Dover – was transgenerational (in that the lover was older, the beloved little more than a boy without the first growth of a beard); it was based on a differential of power (the lover was older, richer, more experienced, and took the active role; the beloved was younger, without resources, gaining an education, and took the passive role); it was transitional (both parties filled the roles of beloved and lover at different stages); and it was not exclusive (it was indeed "just a stage they were going through", and the lover would frequently have a wife and children at home and in due course the beloved would become an adult citizen and take a wife). This homosexuality – more accurately pederasty – played an institutionalized role in Greek society in the 5th and 4th centuries BC. Not all aspects of this part of Greek culture are clear, but neither are all aspects occluded under the rubric of the "love that dare not speak its name". This love had its names; what is not always clear is what these names meant. The beloved was the *pais* or *eromenos*; the lover was the *erastes*. This part of human experience was socialized and circumscribed into an ideal of accepted behaviours, with some actions clearly prohibited. The beloved, the *eromenos*, was a boy of between 9 and 16, the son of a citizen, who in time would become a citizen himself. One of the leisured classes, he spent his time frequenting the gymnasia where, if he conformed to the Greek ideals of young male beauty, he would come to the attention of a prospective *erastes*, himself a member of the citizenry. The ideal was presented as a hunt: the *eromenos* was the quarry, the *erastes* the hunter. By his attentions, his presence, his example, his guidance, and more concrete gifts of cockerel, hare, or hound, the *erastes* by this theory would inculcate the "best" things of civilized life in his beloved. For his part, the beloved was expected not to give in readily to the importuning of the *erastes*. The willingness of the *erastes* to continue in the pursuit of the apparently unwilling *eromenos* was a clear indicator of the *erastes*' excellence. At a suitable end-point, however, it was accepted that it was "creditable to grant any favour in any circumstances for the sake of becoming a better person", glossed by Dover (p. 91) as "acceptance of the teacher's thrusting penis between his thighs or in his anus is the fee which the pupil pays for good teaching or alternatively a gift from a younger person to an older person whom he has come to love and admire". Here again the Classical Greeks have a word for it: the physical expression was *diamerizein* ("intercrural intercourse"). But there were social constraints. It was assumed that the *eromenos* would gain no physical pleasure (the examples of 100 years of vase painting from 570 to 470 BC show the *eromenos* with flaccid penis and often an almost abstracted air, while the aroused *erastes* is "up for it"). And the *eromenos* was protected from the unwanted advances of an *erastes* by the laws of hubris: in myth Zeus carried off a protesting Ganymede (followed in turn by Poseidon taking Pelops) but boy citizens were protected from such outrage by the legal threat of the death penalty. However, though 4th-century BC Athens readily accepted this "homosexual" ethos of *eromenos* and *erastes* (with evidence provided by the Attic comedies of Aristophanes, by Plato, and by Aeschines' speech of 346 BC in prosecution of Timarchus), the freedoms were constrained. The *eromenos* who, voluntarily or due to parental pressure, gave his favours for material gain in overt prostitution lost his place among the citizens and could be arraigned for hubris if he subsequently attempted to act as a citizen by speaking in the assembly or holding reserved office. Similarly, the man or boy who took the passive (receptive) role in anal intercourse (who allowed himself to be penetrated) separated himself from the citizens and was numbered with women, foreigners, and prostitutes. The role of the beautiful yet aloof object of a worthy male citizen's desire was allowed the beardless youth; a coeval relationship between men – more especially if anal intercourse was imputed to it – was not. The manner in which the physical expression of a homosexual relationship forms a subverting continuum with homosocial relationships – such as between Achilles and Patroclus – caused problems for Classical Hellenism. Pausanias and Agathon continued in the relationship "too long" according to the norms, but their respective roles were clear; for Achilles and Patroclus the question was "which one is the

eromenos, which one the *erastes*?" as the relationship had to conform to that paradigm.

Medieval

With the advent of Christianity, the easy, though limited, acceptance of some homosexual practice retreated before the model familiar to all Christian European societies. "Homosexuality" was a series of acts, indulged in at the promptings of demons and devils to the peril of one's immortal soul. Homosexuality was constituted as monstrous, perverse, and evil. Any survey of homosexuality in the Hellenic tradition of the Middle Ages must mention *adelphopoiia*, "the adoption of a brother or a sister", which had much in common with other relationships created by the prayers of a ritual – adoption, godparents or *synteknia*, and marriage. A synthesis of the work of Macrides, Boswell, and Rapp provides the following. *Adelphopoiia* was a social relationship, created by a Church rite that connected two individuals. *Adelphopoiia* was part of a spectrum of Byzantine social relationships "by arrangement" that stretched from blood-kin, through marriage, adoption, godparenthood, and *adelphopoiia* to friendship and acquaintance. Rapp presents the evidence for *adelphopoiia*. Hagiographical texts provide four examples (pp. 291–300): St Theodore of Sykeon and Thomas, patriarch of Constantinople; John the Almsgiver, patriarch of Alexandria, and Niketas, governor of Egypt; Symeon the Fool and John the Syrian; and Nikolaos, patriarch of Constantinople, and Leo VI. The complex *adelphopoiia* relationships of Basil I (867–86) with John the son of Danelis and/or with Nikolaos, caretaker of the church of Diomedes, are followed by a treatment of Basil I's *adelphopoiia* with Symbatios and three others (pp.305–12). Romanos IV Diogenes and Nikephoros Bryennios are followed by John III Doukas Vatatzes and Demetrios Tornikes, and John VI Kantakouzenos and Andronikos III Palaiologos (pp.316–18). This wealth of evidence provided by Rapp shows the "pervasiveness of non-biological 'brotherhood', and especially of *adelphopoiesis*, in Byzantine society". The many prohibitions against *adelphopoiia* stand witness to its continued popularity and also the vague feeling that it was the occasion for "many sins". *Adelphopoiia* was a form of ritual kinship that was common in Byzantium, but which was frowned upon by the Church, though the Church itself provided the ritual by which it was created. *Adelphopoiia* gave formal expression to friendship, or created a situation in which friendship might develop. It was a means whereby members of the opposite sex who were not connected by other ties of kinship could gain access to one another. It could have been used by people who were conducting an illicit sexual relationship – either heterosexual or homosexual – to conceal their relationship under the guise of friendship.

Canonists of the 12th century comment carefully on canons dealing with homosexuality, but without the contemporary examples that illustrate their exegesis of the canons on incest, multiple marriages, or even the practice of magic (Laiou, p. 76). The term most commonly used to signify homosexuality was "man-madness". Laiou remarks that, though the disapproval is marked, a certain "economy" was observed in actually carrying out the punishments (p. 77). A preoccupation in the sources from the 4th and 5th centuries, homosexuality is subsequently rarely mentioned: Laiou suggests that, for all the zeal in normative prohibition, Byzantine society tolerated homosexuality as long as it was not a cause for scandal; in effect, that Byzantium was the first closet society (p. 78). Furthermore, Arethas's scholion to Clement of Alexandria's *Paidagogos* (3. 3. 21. 3) being "the earliest known attestation of 'Lesbian' for a woman erotically oriented toward other women" (Brooten, p. 5, n. 9) seems to position Byzantium clearly at the "queer" end of the spectrum.

Modern

In the period when the modern Greek state came to occupy its present borders, homosexuality in the Hellenic tradition found one voice in the poetry of Cavafy.

> And yet the love you were looking for, I had to give you;
> the love I was looking for
> – so your tired, knowing eyes implied –
> you had to give me.
> Our bodies sensed and sought each other;
> our blood and skin understood.
> But we both hid ourselves, flustered.
>
> "On the Stairs"

The oblique and occluded nature of the remarks in some poems – such as "He Asked about the Quality" – give way gradually to more overt developments, as in "At the Theatre", with "your strange beauty, your decadent youthfulness". Cavafy, however, is a spokesman for the more closeted homosexuality of the early 20th century. In common with a number of European Union democracies, Greece has a confused and complicated attitude to homosexuality. There are gay groups, such as EOK and the refounded AKOE, in Athens and Thessalonica; Mykonos has long been a destination for gay men, Lesbos for lesbians on holiday. Kaliarda, to Greek what Polari is to English, has been the object of etymological and lexical study. A gay press exists in Greece (*Deon* from Athens and *O Podos* from Thessalonica), though titles have in the past been short-lived (though that is not a peculiarity of the Greek-speaking gay world). Orthodox Christians compose 97 per cent of the population and many so-called Christian attitudes to homosexuality (based on a traditionalist reading of Genesis, Leviticus, and Romans) remain. A differential age of consent exists: 17 for male homosexuals, 15 for heterosexuals and lesbians. A survey conducted for the women's magazine *Gynaika* in 1996 (admittedly on only a small sample of 300 individuals) reported that 20.3 per cent of respondents described homosexuality as an illness, 19.6 per cent as taboo, 48.8 per cent as a "different lifestyle", and 14.4 per cent as "nothing unusual". In the same survey 57.6 per cent thought that the adoption of children by a same-sex couple would be "a scandal"; 27.9 per cent thought that the recognition of same-sex marriages was a sign of social decadence, while 33.1 per cent thought it would be a sign of social equality. Were they to discover that their child was homosexual, 23.1 per cent reported that they would take them to a psychiatrist, 56.1 per cent would talk to them about it, 17.4 per cent would leave them free to make their own decisions, and 3.4 per cent would

pretend to be unaware of the fact, "even if they [the parents] suffered". A more substantial survey in 1997 on a wide range of political and social questions, with 1600 interviewees aged between 15 and 29, were asked to indicate agreement, disagreement, or neutrality with the statement: "Homosexual relationships are always wrong." In this survey 28.3 per cent agreed with the statement, 41.7 per cent disagreed, and 23.6 per cent neither agreed nor disagreed. Though anecdotal, the situation in modern Greece – as in many other places – seems to be split between the countryside and the metropolitan centres. The Greek notion of "masculinity" (similar to, though distinct from, the *machismo* of Latin America) is a strong force as one leaves the metropolitan centres. Herzfeld's study of the construction of masculinity in a mountain village of Crete mentions homosexuality only twice, both usages being derogatory, but perhaps with an interesting note of continuity as *poushtis* is reported as meaning the passive partner. "Gay Greece" in the Hellenic tradition may lag behind post-Stonewall North America and Western Europe, but evidence on the World Wide Web suggests a vibrant, if limited, gay scene in modern Greece.

Homosexuality in the Hellenic tradition runs through time not as a constant but as constantly changing: from something uncomfortably close to straight paedophilia, through *adelphopoiia*, to postmodern deconstruction of gender roles and what it is to be a sexual human being.

Honour and Shame

Ancient

A classic description of the values cherished by the ancient Greeks is offered by the speech delivered by the Athenian statesman Pericles in commemoration of those killed during the first year of the Great or Peloponnesian War between Athens and Sparta (430 BC). In this oration, so often compared to Lincoln's Gettysburg Address because of its affirmation of basic principles, Pericles stresses that the dead have won eternal praise before capping his eulogy with a final, and culminating, claim that love of honour alone never grows old and, when one is in the grip of old age and worn out, it is not the pursuit of money, as is asserted, but being honoured that confers the greater pleasure (Thucydides, 2. 44. 4). This sentiment, the supremacy of *time* or honour, is echoed time and time again, both explicitly and implicitly, throughout antiquity: thus Greek literature begins with Homer's *Iliad*, and the *Iliad* begins with the quarrel between Agamemnon and Achilles as a result of which Achilles withdraws from battle and his compatriots are slaughtered. Why does Achilles retreat to his tent? It is because the woman Briseis has been taken from him and so no honour is paid to "the best of Achaeans" (*Iliad*, 1. 412). The law of reciprocity applies: when insulted or injured the man of honour must retaliate in at least equal measure if his personal prestige is to be upheld, and the man of honour is at his most sensitive when a woman from within the family group is in any way threatened. Athenian law, for example, regarded homicide as justified if a man engaged in illicit sex and was caught in the act with a wife or even with other female dependants, (i.e. mother, sister, or daughter), of the killer.

An excessively protective attitude towards female relatives is only one consequence of an obsession with personal and family honour. Honour depends upon the acknowledgement of others and appearance tends to be more important than the truth. "Reputation" is a kind of divinity, according to the poet Hesiod (*Works and Days*, 763–64) who also illustrates reciprocated action: if the first to be wronged in word or deed, you must never turn the other cheek but hit back as hard as you can (709–11); in other words, two wrongs definitely add up to a "right" if the rules of the honour code are observed. Honour, moreover, is reckoned to be a "commodity" and measurable; it is in short supply; and if someone else has honour, it is at your expense and you resent it and try to cut that person down to size by the application of different ranking criteria: if he is powerful or wealthy, then you attack his family background or accuse him of being morally suspect.

It is significant that the word *philotimia*, literally "love of honour", often means "jealousy". As Aristotle remarks, "those who love honour are more envious than those who do not love honour" (*Rhetoric*, 1387b). Recognition, and therefore success, however achieved, is crucial; "if I had succeeded", says the nurse in Euripides' *Hippolytus*, "I would be counted among the wise, since we possess a reputation for intelligence according to success" (700–01). Poverty is a mark of failure, and the poor man has no honour or, as Euripides put it in his *Electra*, "poverty is a disease and it teaches a man to be evil because of his need" (375–76). But a Greek would prefer to

scratch a bare living from the soil rather than work for another, for it was the slave who was at another's beck and call and a slave, again, can lay no claim to honour. Greek society was intensely competitive at every level, whether those engaged in competition were athletes, dramatists, statesmen, or soldiers. And it was the relentless pursuit of honour, often at others' expense, that made society so agonistic and, therefore, unstable.

You undertake action to gain honour; you refrain from action to avoid shame or *aidos*. The Christian virtue of guilt was replaced in antiquity by the concept of shame. Hector refuses to run from Achilles though he knows he cannot prevail: "I feel shame before the Trojans, men and women, in case someone my inferior says 'trusting in his strength Hector has destroyed his people'; it would be far better for me to face up to Achilles" (*Iliad*, 22. 105–09). When the Greeks waver on the field of battle the hero Ajax tells them to be men and place shame in their hearts and to feel shame towards each other. Being typically Greek, Ajax also emphasizes the practical advantage of not fleeing – "when men feel shame more survive than are killed and no glory or safety is to be found in flight" (15. 561–64).

But shame acts as a deterrent far away from battle. The goddess Thetis is ashamed to join the deities because of her misery (*Iliad*, 24. 90–91). Women especially must exhibit shame, keeping well out of the way of men: the great glory of a woman, Pericles claims in the Funeral Speech, is to be least talked about by men whether they are praising or criticizing her (Thucydides, 2. 45. 2). What is required of women is similarly applicable to the young: when the young Telemachus came to Pylos in the *Odyssey* in search of news of his father, he is urged to approach the very much older Nestor without hesitation – "You've no need of shame, none at all" – but replies, "How am I to approach him, how shall I address him? That a young man should question an older man is a matter of shame" (*Odyssey*, 3. 14 and 22. 24). Penelope's suitors are said to have no share of shame, since they behave outrageously in another's house (*Odyssey*, 20. 170–71). In the *Iliad* Apollo comments that Achilles, in maltreating the body of the dead Hector, has destroyed pity and has no shame (24. 44–45). He further adds that shame greatly hinders and helps men (45), and this ambiguous quality associated with *aidos* is also acknowledged by Hesiod (*Works and Days*, 318). Shame is no use if you are destitute, merely inhibiting action; then you need to be bold, to exhibit what is termed *tharsos*. When Telemachus and Nestor actually get down to conversation in the *Odyssey*, the former speaks "having been made bold, for Athene herself placed boldness in his heart" (3. 76–77).

Modern

Since 1950, at the end of the Civil War, demographic changes and economic growth in Greece have been rapid and impressive. Most Greeks no longer live in villages and earn their living as peasant farmers. Due to the rapidity of this urbanization process the majority of the Athenian population were either not born in that city, or are the children of parents who were not born there. The extent of its effects, visible in the anarchic physical growth of the city, the widespread ownership of cars, the variety of consumer goods already possessed or on display in shops, in contrast to the decaying mountain villages emptied of their population, easily suggests profound changes in the values and perception that unsophisticated villagers brought with them from their country origins. Attitudes, undoubtedly, have altered in many respects, but changes in the central personal values of popular culture have not yet been fundamental.

In all the variations of local community in Greece the significance of the family is a constant feature. It is not only a domestic association of individuals with affections based on marriage and blood relationship, and a concern for the care and upbringing of children. It is a religious community with icons and other sacred objects, a channel of grace for fertility and protection. It is a corporate enterprise, most obviously so if its main resources are from the land it cultivates, but also in the small manufacturing and retail businesses that are so numerous in Greece. Even where the members of a family work for a wage or a salary (as is increasingly the case) individuals have moral obligations to the family, defined as those who live and eat together in the same house and are protected by the same icons. Among them there is an identity of interest and responsibility. The critical test for any house, and particularly its head, is the honourable settlement of children in marriages that depend on complex property negotiations between families, even where a courtship has its origin in the discovery of personal attractions. Marriage is the proper destiny of every young person and the reputation of a family cannot be subject simply to the play of personal preferences that might result in an unsatisfactory union, or in none at all. Social competition for marriage partners is intense precisely because acceptance of an individual in marriage, which necessarily extends to an acceptance of his or her family, depends on the demonstration of wealth and influence. This is so in both town and country. In these struggles men tend to think of their local world as one of limited resources. The success of one family is seen as depressing the fortunes of another. Secrecy in one's own affairs, and the surveillance of others, are opposite aspects of the same problem. It encourages, indeed requires, a general attitude of wary and intense distrust of all persons who do not live in the same household.

The central traditional value that underlies these institutions is the notion of honour, *time*. Subjectively it expresses an acute awareness of integrity and independence, of not being touched or humiliated before others through particular kinds of failure; outwardly it is the recognition of worth, grudgingly conceded by others. Two sentiments are closely related to it: *philotimo*

which is the "love of honour" that encourages a man to act rightly, and therefore is particularly sensitive to any suggestion that he has not done so; and *dropi* (shame), which is the fear of failure that inhibits wrong actions, or a sense of acute discomfort that follows after them. *Time* is related in various ways to a wider complex of value terms, concepts that express ideas about qualities and states of mind such as manliness, self-regard, envy, cleverness, cunning, greed, respect, and self-interest. *Time* itself is applicable to the individual and to any group to which he or she is morally committed, particularly in Greek rural society to the family, the village, and the nation. *Time* emphasizes the moral identity of the individual with the group, so that all members are diminished if an insult is offered to any one of them, and each is responsible to the others for his behaviour and for the public judgement it attracts. As it is popularly understood, the primary reference of *time* is to the moral division of labour within the family, expressed in two sex-linked and complementary qualities, *andrismos*, the manliness of men, and *dropi*, sexual shame in women.

Manliness is, in part, a self-assertive courage and to have it a man must be *varvatos*, that is well endowed with testicles and the strength that is drawn from them. This power, of course, may be ill employed and lead a man to rape or casual killing. The manliness related to honour requires this physical basis but must discipline animal strength and passions to its own ideal ends.

In a fallen world this nobility of men is threatened by the sexuality of women. Only the quality of *dropi*, sexual shame, which implies an instinctive avoidance of sexually provocative behaviour, indeed in traditional communities, an attempt in dress, movement, and attitude not to employ in public the physical attributes of her sex, is an adequate protection of a woman's *time*, her reputation for virginity in the case of a daughter, for fidelity in the case of a wife, against damaging imputations. In reciprocal fashion *andrismos* enables a man to provide for his family and protect its women against insult or assault. Failure in the behaviour required by these values compromises the *time* of all the members of a family and leads to the collapse of its reputation. Such, in very schematic outline, are the principal features of a general moral order in traditional communities. But age is a further dimension that differentiates these values. It is the unmarried son or brother, the *pallikari* or young hero, as yet unburdened by the principal responsibility for a family, who is expected to reply with physical force when an insult is offered. The married head of a family must discipline his anger, establishing the independence and reputation of his family by his astute cleverness, *exypnada*, even, in the world as it is, by lies and cunning.

It will be objected that this pattern of *time* values has little to do with contemporary Greece, an increasingly urbanized and sophisticated society. Social and sexual conventions among the younger generation in Athens appear to be little different from those in other European capital cities. Even remote villages are undergoing a process of embourgoisement. Yet this pattern of values persists at least in a qualified form.

A number of circumstances have contributed to this. The radical definition and complementarity of roles by sex and age in the Greek family, even in a middle-class urban setting, is an important source of its strength and identity, in particular the opposition of *andrismos* and *dropi*, the assertion of manliness and the disciplined attitudes of shame. What does not change is the intense self-regard of men in their competitive struggle for affluence and social status and particularly for the material display of consumer goods such as cars and household furnishings which are markers in establishing a family's social standing. And for women the unchanging sanction of shame still relates to the exceptional value placed on a mother's devotion to her children. It is exactly in this relationship with their mother that children begin to learn these values and the proper behaviour related to them; they accept them as they grow into their appropriate sex roles within the family. In that sense this aspect of rural Greek culture is an intimately domestic culture, and by its nature less easily changed than more external behaviour in the public domain.

Shame also governs the concern of the young woman before her marriage, whatever the accepted relaxations in the conventions of behaviour with members of the opposite sex, to present herself in a manner that is acceptable to candidate bridegrooms and their families. The obligation in the city to arrange an honourable marriage for a daughter remains imperative. Although the control of a family over an unmarried daughter is less secure than in the past, her obligation to her parents and siblings is certainly no less vital and no less subject to her sense of shame. An important aspect of *time* values, therefore, is that these ideas are not semantically linked to particular unchanging details of social behaviour. What is not honourable in one community or at one time may be acceptable in another.

Hospitality

The relationship between host and guest, *xenia* ("guest-friendship"), is one of the most hallowed in Greek culture. *Xenia* may exist between two individuals (usually two males), two groups (such as two towns), or an individual (especially a ruler) and a group. For example, Herodotus describes the relationship of Croesus (king of Lydia in the 6th century BC) with the Ionians (1. 27. 50) and Spartans (1. 69. 3) with the term *xenia*. Guest-friendship also existed on an interfamilial and intergenerational level. For example, if a person's father had formed a guest-friendship with another man, the son could expect hospitality from the same household, even if neither the

father nor the original host was still alive. In Homer's *Iliad* (6. 215–31) the Trojan Glaucus and the Greek Diomedes break off their duel when they learn that their fathers were guest-friends. The two warriors even exchange gifts, just as their fathers once had. The Homeric ideal carried over into society as is evidenced in the 4th century BC by Demosthenes' speech *Against Polycles* (50.56), which notes how Pasion's son was able to borrow money because of his father's numerous guest-friends. The example of Pasion's son also shows how guest-friendship might also provide a person with relief in times of financial difficulty. Even people who were fugitives from the law or exiled from their native town could expect hospitable treatment (see Demosthenes, 23. 85 (*Against Aristocrates*); Diodorus, 14. 32. 1).

After contact with a stranger was initiated, the guest-friendship was ritualized through the clasping of hands, the partaking of food, and the giving of gifts, especially those given by the host to the guest. The guest could not "insult his host", "demand or take what is not offered", or "refuse what is offered" (Pitt-Rivers, pp. 27–28). On the other hand, the Greek host could not "insult his guest", fail "to protect his guest" or his guest's honour, or fail to be as hospitable as possible (Pitt-Rivers, p. 28). Greek hosts had the added responsibility of providing for the stranger who might arrive unannounced and at an inopportune time. Even if a Greek was approached by a stranger at an inconvenient moment, turning him away was considered disgraceful. The extremes to which a Greek would go to uphold the custom of guest-friendship are displayed in Euripides' *Alcestis* (438 BC), where Heracles arrives unexpectedly at Admetus' home just as Admetus is preparing to bury his wife Alcestis. Despite Heracles' inconvenient arrival, the over-hospitable Admetus refuses to turn him away and even pretends that he is conducting a funeral not for his wife, but for a maidservant.

Besides having to provide for a complete stranger at an inopportune time, Greek hosts seem to have felt compelled to provide the most lavish hospitality possible, even if it was beyond their financial means. In Homer's *Odyssey* the guests of nobles such as Nestor, Menelaus, and Alcinous not only receive the basic amenities (food, drink, and lodging), but are also bathed, given clothing, offered or given transport to their next destination, and given valuable gifts to take with them. Such hospitality recalls the Acragantine Tellias, who lived in the late 5th century BC. Tellias was so wealthy that he had servants stationed at his gates who would invite all strangers who passed by to be his guests. Tellias was even said to have entertained and clothed 500 cavalry from Gela (Diodorus 13. 83. 2). Likewise, Plutarch (*Demetrius*, 12. 1–2) reports that in the late 4th century BC an Athenian proposed that whenever Demetrius I of Macedonia visited Athens he should be provided with the same hospitable honours (*xenismoi*) granted to the divinities Demeter and Dionysus, and that the citizen who was most lavish in his hospitality towards Demetrius should be granted an offering of dedication at public expense. This is in contrast, though, with *Odyssey* 14, where the disguised Odysseus tests the hospitality of his swineherd Eumaeus. Despite Eumaeus' humble estate, the hospitable swineherd provides his guest with food, lodging, and even the cloak off his own back. Odysseus' stay with the swineherd also illustrates the ideal minimum that a stranger might expect from a Greek host.

Hospitality was taken so seriously by the Greeks because the gods themselves were thought to protect strangers. The supreme god Zeus is most often associated with guest-friendship. Homer's Odysseus warns the Cyclops Polyphemus against injuring guests because Zeus would protect strangers (*Odyssey*, 9. 270–71). In another myth Tantalus, who attempted to feed the gods with the flesh of his son Pelops, was killed for this violation of *xenia* and was condemned by Zeus to hunger and thirst perpetually in the underworld. Zeus' punishment of Tantalus is all the more poignant when we consider that some sources make him Zeus' own son. Apollodorus (3. 8. 1) preserves a similar myth about the Arcadian Lycaon. Zeus, having heard that Lycaon and his sons surpassed everyone in their pride, tested them by appearing at their home in the guise of a peasant worker. When they attempted to feed him with human flesh, he destroyed Lycaon and all of his sons (except one saved through Gaia's intervention). Even after the advent of Christianity one still finds references to Zeus as the patron of strangers in Libanius (4th century; *Declamation*, 4. 2. 9), Nonnus (5th century; *Dionysiaca*, 20. 176), and Constantine VII Porphyrogennetos (10th century; *On Virtues and Vices*, 1. 261. 29), to name a few.

As evidenced by the above-cited examples from the *Odyssey*, the importance of proper relations between host and guest is emphasized from the earliest extant Greek literature. Both of the Homeric epics have guest-friendship at their core, and established for the Greeks the ideals of *xenia*. The Trojan War, the backdrop for the *Iliad*, arises out of a violation of guest-friendship as the Trojan Paris abducts Helen, the wife of the Greek Menelaus. Legend has it that Menelaus had entertained Paris in his home for several days before the abduction. Thus, at the heart of Paris' crime is his violation of the custom of guest-friendship (compare Aeschylus, *Agamemnon*, 399–402, 699–708; Euripides, *Trojan Women*, 865–66; Quintus Smyrnaeus, *Posthomerica*, 13. 412–14).

The *Odyssey* "may be viewed as a study in the laws of hospitality" (Pitt-Rivers, p. 13). Odysseus' son Telemachus, as he searches for his long-lost father, enjoys the hospitality of his father's war comrades Nestor and Menelaus. In contrast to his son, Odysseus, returning from the Trojan War, must overcome ogres like the inhospitable Cyclops Polyphemus, who eats several of his men. Eventually Odysseus, having lost all his ships and crew, is transported to his native land thanks to the hospitality of the Phaeacians. When he finally returns home, disguised as a beggar, he is mistreated by the suitors who hope to wed his wife Penelope and have been consuming his estate during his absence. Ultimately Odysseus sheds his beggar disguise and destroys the suitors who, like Polyphemus earlier in the poem, have clearly violated the custom of *xenia*.

Of course, the example of hospitality established in Greek myth and fiction represents an ideal. Still, sources from Greek society show reverence for the bond between host and guest, as well as a tremendous effort to accommodate strangers. In the 5th century BC the guest-friendship between the Spartan Archidamus and the Athenian Pericles led Pericles to believe that when the Spartans invaded Athenian territory Archidamus would avoid Pericles' estate (Thucydides, 2. 13. 1; Plutarch,

Pericles, 8. 4, 33. 2). In the following century Xenophon (*Anabasis*, 3. 2. 4) complains about the treachery of the Persian satrap Tissaphernes who has violated *xenia* and complains particularly about his lack of reverence for Zeus Xenios, "Zeus, the god of hospitality". Xenophon's *Anabasis* contains several references to various towns supplying the Greek army with oxen, sheep, barley-meal, and wine. The people of Sinope, for example, sent the army 1500 jars of wine (*Anabasis*, 6. 1. 15). From the *Anabasis* it becomes clear that the Greek army could not have accomplished their lengthy march without the hospitality of the various towns who provided them with food, drink, and other necessities. In the same century Aeschines' condemnation of Ctesiphon's arrest, torture, and execution of Anaxinus of Oreus is made all the more shocking to his Athenian audience when it is reported that Ctesiphon had formerly dined with Anaxinus in the latter's home. Accordingly, Aeschines claims that Ctesiphon murdered his host, and even claims that Ctesiphon did not deny this charge (*Against Ctesiphon*, 3. 224).

With the advent and spread of Christianity through the Hellenic world, the ideals of *xenia* established by the Homeric epics merged with the new belief system, since the early Christian writings also embraced the ancient ideal of *xenia*. In the Gospel of Matthew (25: 34–46) Jesus praised those who would (among other things) welcome a "stranger" (*xenos*), saying that "whatever you did for one of these least brothers of mine, you did for me". Jesus goes on to say, though, that those who did not (among other things) give a "stranger" welcome would "go off to eternal punishment". Elsewhere in the New Testament the author of Hebrews urges the audience not to neglect hospitality (*philoxenia*), since "through it some have unwittingly entertained angels" (13: 2), an idea reminiscent of the ancient Greek stories such as that of Zeus and Lycaon mentioned above.

The Christian concern for strangers manifests itself in attempts to provide accommodation for them and the poor. In the 4th century AD Basil of Caesarea saw the value in building places for strangers to lodge (*Epistulae*, 94. 1. 36). Procopius (*Buildings*, 1. 2. 14, 17) notes that in the 6th century the emperor Justinian erected in certain cities such buildings, called *xenones* ("rooms for guests" or "rooms for strangers"), for the poor and strangers. Procopius says that the *xenones* at Byzantium were intended as temporary quarters for strangers to the imperial city who found themselves in need of accommodation (1. 11. 27). Justinian took care that similar provisions were afforded to strangers in Antioch, Ciberis, Mocesus, Jerusalem, and Jericho.

Not only would guest-friendship continue to flourish on a public level, but on a private one as well. In a situation similar to that of Archidamus and Pericles, Procopius (*De Bellis*, 3. 9. 5), writing in the 6th century AD, reports that the guest-friendship between the Vandal king Ilderic and Justinian, who had exchanged substantial monetary gifts, was one factor in dissuading the Goth Theodoric from taking revenge against Ilderic and the Vandals for their execution of a number of Goths. A parallel to Pericles' expectation of Archidamus is also found in an anonymous folk song of the 18th or 19th century entitled "Constantine and Arete" (Trypanis, pp. 465–66), where Arete's brother Constantine advocates marrying his sister to a foreigner. Since Constantine would have to serve as a soldier in foreign lands, he reasons that, with his sister married to a foreigner, he would not be considered a stranger if he were in the country of his sister's husband.

The horror evoked by atrocities such as those committed by the Cyclops Polyphemus is echoed in an anecdote from Procopius (*De Bellis*, 6. 20. 27–30). When Belisarius' siege of Urviventus caused utter destitution in the region, two women who lived near Ariminum killed and ate 17 strangers who lodged with them, until the 18th stranger managed to kill them. Writing in the 12th century, Anna Komnene (*Alexiad*, 3. 8. 3) praised Anna Dalassena for allowing her home to be a refuge for poor relatives as well as strangers (*xenoi*). She also notes (*Alexiad*, 15. 7. 3) the concern that her father, emperor Alexios, showed towards prisoners of war and strangers (*xenoi*). While the previous examples show that women could also engage in guest-friendship, in an anonymous folk-song of the 18th or 19th century entitled "The Bridge of Arta" (Trypanis, p. 471) a prophetic bird tells a group of bridge builders, frustrated by the frequent collapse of their bridge, that only by killing a woman, the wife of the bridge's master builder, would the bridge stand firm. The loquacious bird warns the builders, though, that they should not kill an orphan, a stranger, or one who happens to pass by.

Thus, in a culture interwoven with the Homeric ideal and Christianity, the modern Greeks continue to revere the custom of hospitality, although it is no longer as strictly ritualized as in ancient times. Nevertheless, the extension of hospitality to a stranger gives the Greek the opportunity to demonstrate not only to the guest but also to his own neighbours (perhaps what is more important) an outward and visible sign of his wealth and generosity. Thus, the Greek male in particular will extend hospitality not only out of kindness, but also to impress the stranger, as well as to gain "status and respect within the village itself: after all, the ability to consume grandly and to give freely proved the host's success as a winner of wealth" (McNeill, p. 19). Thus, in modern times, the offering of hospitality allows the Greek male to emulate the heroes of his culture.

Hospitaller Knights of St John: Street of the Knights in Rhodes town, which was the headquarters of the Hospitallers from 1309 to 1523

Hospitaller Knights of St John

With the Knights Templar and the Teutonic Knights, the Knights of the Order of St John of Jerusalem, also known as the Knights Hospitallers or Hospitallers, were one of the three great international military orders. The Knights of St John had an obscure beginning. They may have been connected with the Benedictine abbey of Santa Maria Latina in Jerusalem or with another foundation made by the Amalfitans around 1050. Care for the poor and the sick, together with the provision of hospitality to pilgrims, were the core activities of the order and were to remain so after its militarization.

By the mid-1130s, under the mastership of Raymond of Provence (1120–60), the order took on the responsibility of guarding pilgrims on the road from Jaffa to Jerusalem and thus developed the capability to fulfil other military duties such as service with the field army and castle guard. Quite why the order developed in this way is unclear but it may have been connected with the chronic shortage of fighting men in the kingdom of Jerusalem. The order now developed two types of brother: military brothers (knights and sergeants) and brother infirmarians.

With the loss of Acre in 1291 the order turned its back on crusading in the Holy Land and developed in line with contemporary ideas of new directions for active crusading. In 1301, in furtherance of this modernization and in the interests of establishing some sort of equity within this truly international order, the system of *langues*, or national groupings, was introduced.

The order moved first to Cyprus and soon after that conquered the island of Rhodes (1306–09). From this island it was in a good position to play a prime role in naval crusading, protecting western shipping lanes in the Levant and containing Turkish naval aggression, and in turn attacking the Turks and offering advice to others who might resist the advance of the Ottomans. Apart from Genoese and Venetian flotillas, the order was the sole western military force capable of offering assistance to the shrinking territory of Byzantium.

After 1312 the Hospitallers became the most powerful order in Greece, where they acquired the former Templar lands in Achaea and in Crete. Interestingly, the Templar lands in central Greece passed to Gautier de Châtillon, the guardian of the claimant to the duchy of Athens and Thebes which was then ruled by the Catalans. Under the mastership of Juan Fernández de Heredia (1377–96) the Hospitallers' involvement in Greek lands increased dramatically. The island of Rhodes was limited by its size and economic capacity, while the spearhead of the Turkish advance was moving to the southern Balkans. Remedy appeared to be at hand in a five-year lease of the principality of Achaea negotiated with Joanna of Naples in 1377. In the first instance Achaea would act as a springboard for an attack on the despotate of Arta and thus provide the order with territories to exploit economically and from which to resist the Turk. The scheme fell through, but negotiations continued through the 1380s. In 1399 the Greek governor of Mistra ceded Corinth and Mistra to the order for a year because of the invasion of Yakoub Pasha. The order successfully defended the isthmus of Corinth and less successfully tried to galvanize resistance to the Turks along the northern shore of the Gulf of Corinth. By 1404, largely due to local Greek hostility, the order withdrew from southern Greece. One lasting monument to Heredia and to the involvement of the Knights Hospitallers in Greece is the Aragonese/Castilian version of the *Chronicle of Morea*, which was copied on Heredia's orders in 1377. The *Libro de los fechos et conquistas del principado de la Morea* relates the history of the Latin empire and the principality of Achaea from 1200 to 1377 and incorporates much additional information not contained in the French and Greek versions of the chronicle.

PETER LOCK

Summary

One of the military orders formed in the crusader states, the Knights of St John abandoned the Holy Land in 1291 and moved first to Cyprus and then to Rhodes (1309–1523). From there they wielded considerable power in Greece throughout the 14th century and helped to mount a defence against the Turks.

Humanism

The label "humanism" has been applied to many different, sometimes incompatible, viewpoints. In relation to Greek cultural history, three attitudes may be characterized as paramount: (1) the humanism of Homer and of "Classical" Greece; (2) the humanism inspired by Byzantium-in-exile during the Italian Renaissance; and (3) the "secular humanism" that is the bête noire of much (though not all) traditional religious piety.

For some scholars, the question raised by the humanism of Homer concerns Homer's religious notions, which seem "more advanced and more civilized" than the superstitious practices of Greeks during some later times. How, they wonder, was it possible for Greek culture to regress from Homer's insights, especially given the centrality of the Homeric texts in Classical Greek education?

While such worries may be easily brushed aside (as presupposing an unrealistically "linear" conception of religious enlightenment), there is a much deeper conception of the humanism of Homer. Moses Hadas presents the Homeric ideal as summarized in the line (*Iliad*, 6. 208 and 11.784): "to strive always for excellence and to surpass all others". The humanism of Homer represents, he holds, "the authentic peculiarly Greek view", to be contrasted with the "deviation" of Plato and others.

> The goal of excellence, the means of achieving it, and...the approbation it is to receive are all determined by human judgment. The whole outlook, in other words, is anthropocentric: man is the measure of all things. This

> does not imply that there are no gods...The important point is that the sphere of the human and the sphere of the divine are disparate...Other items in our Greek legacy are only trimmings or implications of the central doctrine of man the measure.

Whatever may be the best understanding of Homer and of Classical Greece, it is beyond dispute that during the so-called Renaissance in Italy, beginning in the late 13th and early 14th centuries – even as Thomas Aquinas and Dante Alighieri were summing up medieval thought – and lasting for perhaps three centuries, the effect of texts from the Classical period of Greek history was such as to make Renaissance humanism a vital chapter in the story of the emergence of the modern world. The literature on the Renaissance is vast and controversial (for example, concerning the question of how many "renaissances" there were), so its relevance here must be limited to two aspects. First, there is the fact that the Renaissance conception of life's ideals involved concepts and images derived (albeit in sometimes distorted form) from classical Greece. Second, there is the fact that this enormous effect was mediated, if not entirely caused, by the interventions of a small number of Byzantine émigrés during the latter days of Byzantium.

In 1204 Constantinople fell for the first time, to a side-tracked group of Crusaders. Though the city was reclaimed in 1261, its days were numbered. The Byzantine scholar Manuel Chrysoloras was brought to Florence in 1396–97 to teach Greek. Deno Geanakoplos, a prominent 20th-century historian of the period, judges that "the tremendous impetus given to the study of Greek literature in the Renaissance may be ascribed in great part to his teaching." Four decades later, in 1438–39, the Council of Florence met, with the purpose of trying to reunite the Greek and Roman churches. It did not succeed in that aim, but George Gemistos Plethon, who attended as part of the Byzantine delegation, gave lectures on Plato that raised great interest in Florence and led Cosimo de' Medici to found an academy in Florence for the study and translation of Platonic texts. Johannes Bessarion, a former student of Plethon's who was also in the Byzantine delegation, subsequently became a Roman Catholic ecclesiastic and the foremost patron of Greek émigré scholars. In 1453 Constantinople fell to the Turks, and the Byzantine empire effectively expired, occasioning a further flow of emigration. There is little doubt that these Greek-speaking émigrés, along with the texts that they (as well as Latin travellers) brought west, played a major role in the development of humanist ideas in Italy and subsequently in the rest of Europe, whatever other factors may have contributed.

Reading Greek (and teaching it) was not for these émigrés the accomplishment that it would have been for an Italian, of course, and this has led some scholars to question the intellectual eminence and originality of the émigrés, pointing out the limited, strictly philological character of their accomplishment. To assay the justice of such aspersions is beyond our present task, but it seems safe to agree with Arnold Toynbee's assessment: "The refugee Greek instigators of Greek linguistic and literary studies in the West have played a more important part in Modern Western history than in Modern Greek history." He is thinking, of course, of the direct impact of the Renaissance. Indirectly, the effects may be of enormous consequence, to the extent that the changes encouraged by Renaissance humanism (including, in the view of some, increased secularism, naturalism, and materialism) can be viewed as determining the overwhelming challenge posed by the West to the rest of the world. As Toynbee observes:

> We are all having to try to make life possible and endurable in the artificial manmade environment that has been substituted for our former natural environment by the astonishing modern advance of technology. The Western peoples are not exempt, though the West was the local workshop in which this modern advance was carried out.

And then he adds, of the Greeks: "No other surviving non-Western people has had to contend with pressure from the West for as long."

The nature of Renaissance humanism has been much debated. Paul Oskar Kristeller, the author of many books on the subject, is "unable to discover in the humanist literature any common philosophical doctrine, except a belief in the value of man and the humanities and in the revival of ancient learning". There is also much debate about the value of the reverence for Classics thus instilled. "The humanist movement in the West began as a Latin revival", Deno Geanakoplos says, "but the restoration of Greek letters served perhaps more than any other single factor to expand its intellectual horizon." Toynbee, to the contrary, credits the "Hellenic paideia" with having "prevented the emergence, in the Byzantine Age, of a cultivated literature in Modern Greek", and believes that it "hypnotized Western men of letters" and "held the Western educated public spellbound" during the Renaissance. Only towards the close of the 17th century, he claims, did westerners find "the courage to think and investigate for themselves". Of course, what they proceeded to think for themselves was precisely that religious and scientific ferment that eventuated in the "modern secularizing rationalizing movement", which in turn has produced the politics and technology through which the West has, for good and for ill, unsettled the world.

In this context, it is easier to understand the remark of the Greek soldier quoted by Patricia Storace in her remarkable book, *Dinner with Persephone*:

> The fault is with humanism, the humanism of the Renaissance, which places man at the center of the Universe where God should be, man in all his arrogance, egoism, and materialism. This is why we are in a world where we destroy the environment and value money above life, this idea of the greatness of humanity.

Storace comments (with uncharacteristic derision) that it is "hard to imagine a more arrogant and uncomprehending dismissal of humanism, whatever its flaws." She has a point, of course. The soldier's diatribe hardly does justice to the intentions or achievements of humanism's pious agnostics, let alone Christian humanists such as Erasmus, or the fideist Montaigne, who imbues his humanism with a spirit of toleration and generous curiosity. And yet the soldier's words carry a challenge not to be lightly evaded.

Greek has been the vehicle of Christianity since the New Testament was first written down, and the Eastern Orthodox Church has viewed itself as preserving in authentic form some of Christianity's oldest ritual and liturgy. Greece today continues to be pervaded by Christian belief specifically and, more

broadly, by various forms of religious belief and practice that may strike some as "superstitious" when compared with the humanistic religion of Homer. The central Christian conviction, that God "so loved the world", runs counter to the idea that the worlds of gods and of human beings can go about their separate business, unconcerned with one another's existence. "St Socrates" is a quintessential humanist figure because he questions claims of exclusive knowledge lodged by "humanists", on behalf of the all-sufficiency of the "human", just as energetically as he questions the unthinking piety of Mr Orthodox. Renaissance humanists rejected (some) dogma, not religion, though in the long run, as the case of Erasmus illustrates, this set the stage for the Reformation.

In its long-term impact, humanism is helped by links to notions such as freedom and democracy. The link between humanism and freedom comes through the connection between the concepts of humanity and civilization. As Gilbert Murray notes, humanity (what distinguishes human life from that of other animals) requires a buffer against mere necessity which civilization provides:

> To the Greeks civilization begins when men live in a *polis*...He has leisure, and for the first time can begin to do what he wants to do, and not simply what he must do in order to live. The Greeks were fond of distinguishing between *to anagkaion*, the "necessary", the thing you must do because you are compelled, and *to kalon*, "the beautiful", as we clumsily translate it; the thing that looks good, that you desire for its own sake...Civilization...sets man free to live the life he really desires, to study the things that really interest him, and not merely the things which other people compel him or pay him to do.

The link between humanism and democracy comes through the connection between the concepts of humanity and experience. Walter Pater, in an influential discussion of the Renaissance, describes humanism as centred on a sense of the permanent value of the experience of human beings: "the essence of humanism is that belief...that nothing which has ever interested living men and women can wholly lose its vitality" (Pater, "Pico della Mirandola", 1873). In a similar spirit, Gilbert Murray insists that "a scholar...secures his freedom by keeping hold always of the past. He draws out of the past high thoughts and great emotions." And about the "religion of Democracy", Murray says that "the cardinal doctrine of that religion is the right of every human soul to enter, unhindered except by the limitation of its own powers and desires, into the full spiritual heritage of the [human] race." Strictly speaking, democracy is a step beyond humanism, but if one agrees, in Terence's famous words, *homo sum: humani nihil a me alienum puto* ("I am a man; nothing human is alien to me"), then the step, from the value of all human experiences to the democratic value of all human beings, may seem a small one.

Or it may not. The centrality of competition in ancient Greek culture has been often noted. Hadas, among others, sees competition as part of the humanist heritage, "and perhaps the central and all-subsuming factor in our Greek legacy". How to mediate between the doctrine that man is the measure and the doctrine that nothing human is foreign, how to combine a belief in human excellence with a respect for all human beings, remains humanism's puzzling bequest.

Hunting

Up to the end of the classical period hunting was pursued mainly to supplement a largely vegetarian diet and to protect flocks and homesteads against predators, chiefly wolves and jackals. Myths abound of heroes such as Heracles, Meleager, and Theseus slaying beasts that ravaged their neighbourhoods. Hunting imagery is common in Homer, who describes Odysseus killing for the pot (*Odyssey*, 9. 154[-58; 10. 156–71). Homer's huntsmen go on foot with bow or spear, accompanied when not abroad by hounds. The quarry was chiefly deer, wild goats, and boars. The last of these must have been plentiful since the tusks of some 30 to 40 boars were required to provide the plates that gave strength to a single example of one type of Mycenaean helmet. The hunting of lions, mentioned by Homer only in similes, is uncertain, although fragments of bones have been found at Tiryns in contexts of *c.*1230 BC and lion hunts are depicted on a few pieces of Mycenaean art, such as a late 16th-century BC bronze dagger inlaid with figures of an archer and spearmen with huge shields fighting a pride. Mycenaean bows were "self" bows (from a single stave of wood), although the composite bow, which was probably introduced in the Dark Age, was clearly known to Homer; spears were generally, if not exclusively, for thrusting rather than throwing. There is pictorial evidence for the use of nets in catching boars (although they are not mentioned in Homer's famous description at *Odyssey*, 19. 428–58), stags, and wild cattle (probably the auroch and possibly the wisent) and also for hunting from chariots (despite the unsuitabilty of the terrain). One fragmentary mid 13th-century fresco from Tiryns uniquely depicts huntresses amid the men.

In the Archaic age Spartans hunted game to supplement the meagre diet of their common messes, while in Attica aristocratic men, as is shown principally in vase-paintings, presented younger males with live and dead game as lovers' gifts and, probably, also as tokens of their own manliness.

The principal source of information for hunting in the Classical period is Xenophon's *Cynegeticus* ("The Hunting Man"), which deals principally with nets, dogs and their training, and the hunting of hares, although deer, boar, and other large mammals are mentioned. He warns against allowing hounds to chase foxes, since this ruins them for hunting hares. Although for Xenophon its primary purpose is still for the pot, he does recommend hunting as excellent training for not only warfare, since it fosters hardiness, discipline, and initiative, but even civic responsibilities, in both of which he is supported by Plato (*Laws*, 822d–824c). Presumably for these reasons there was a law at Athens which permitted hunting through standing crops. There is evidence, however, that the development of democratic ideas, of which both Xenophon and Plato highly disapproved, had engendered an adversely critical reaction against hunting as an unnecessary aristocratic extravagance, and that the growth of population had in Attica reduced the extent of accessible terrain for the activity.

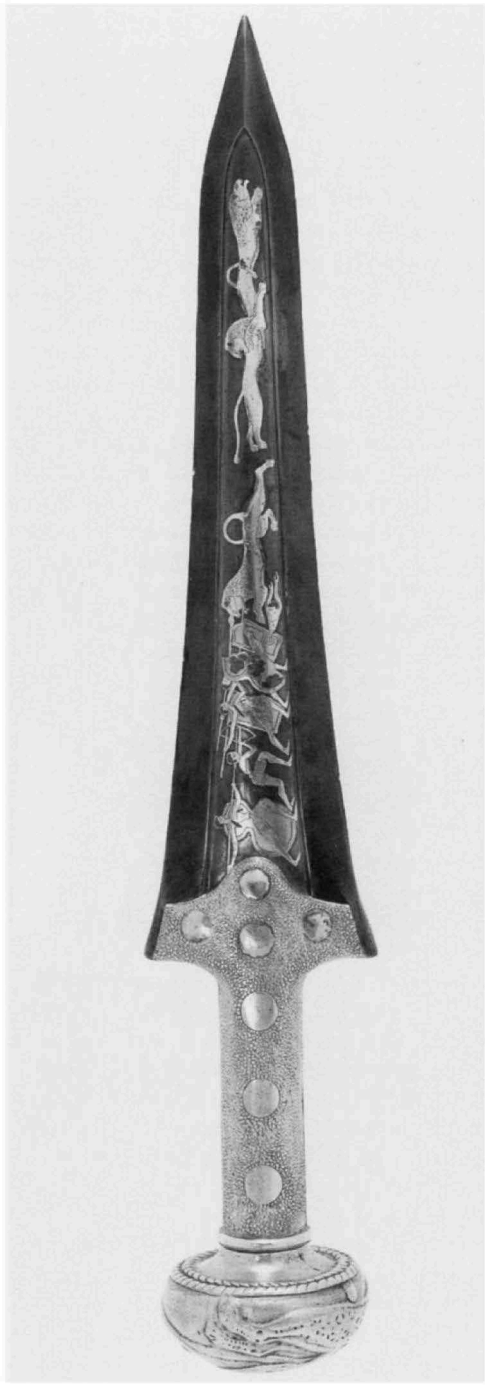
The favourite breed of hound for hunting hares (and even boars because of its superior tracking abilities) was the Laconian, of which there were in Xenophon's day two breeds neither of which is recognizable today. The larger was perhaps 45 cm high at the shoulder with a weight of 13 to 18 kg. All hounds wore leather belts, collars, and, for ease of slipping, separate leashes. The hunters, sometimes wielding curved throwing-sticks, followed most commonly on foot (for Xenophon horses were used only to get to and from the hunt). The hares, when found by the hounds and started, were caught in nets of flax. Purse nets were set in narrow defiles: the mouth was propped open by sticks which fell when the hare hit the net, whereupon the net-watcher (presumably a slave) drew tight the skirting-line. Larger road nets were stretched across paths and long nets, up to 55 m in width, in level open areas both caught hares and diverted them to the purse nets.

Deer (red, roe, and probably fallow) could be caught in nets and, in summer when they tired easily, run down by hounds before being pierced by the hunters' javelins. In spring fawns left concealed by their mothers were tracked and caught to attract hinds. Hunters also used carefully concealed foot snares. These consisted of a wooden clog attached to a noose which lay on a plaited ring of yew with inward-facing iron and wooden nails placed over a hole. The clog both hampered the deer's flight and left an easily visible trail.

The animal most prized by hunters was the boar, whose slaying without the use of nets was deemed by the Macedonians the token of manhood (the unreliable Hegesander reportedly claimed that even at the age of 35 the future king Cassander had still to sit in a chair by his father like an adolescent for his failure to accomplish the deed). Whether caught by a foot snare or driven out of a covert, the boar was a match for hounds and hunters armed with javelins and a thrusting spear especially designed with projecting teeth on the socket to prevent the beast running up the shaft.

Xenophon mentions also (*Cynegeticus*, 11) that in the Pindus range, Thrace, Mysia, and Syria "lions, leopards, lynxes, panthers, bears, and similar wild beasts" were caught by means of poisoned bait and pitfalls to which they were lured by tethered goats.

Fowling was practised principally by professionals, who were generally despised by the literary elite. Plato considers the art unbecoming to a gentleman (*Laws*, 823e), although Xenopohon is on one occasion kinder (*Cyropaedia*, 1. 6. 39). The trapping of fur-bearing animals such as otters and martens was similarly not deemed an honourable pursuit by the aristocracy, although it was quite common despite a lack of the fashionable modern sartorial relish for furs. The fowlers' main quarry was partridges, pheasants, quails, doves, and various smaller birds. Their favourite aids were purse nets, snares, and the use of glutinous birdlime (often made from mistletoe berries) which was either smeared on the twigs of trees or on rods which could be fitted into each other to attain the desired length. Tamed females of the hunted species were employed for decoys, as were also owls since during daylight these are often mobbed by small birds. Aristotle (*Historia Animalium*, 620a33–b6) and others mention the Thracian technique of depending upon wild hawks to drive back to the ground birds started by the fowlers. A mid 2nd-century AD North African mosaic shows a fowler camouflaged by a goatskin. From close observation knowledge of the nature and habits of the animals and birds frequently hunted was extensive and extended remarkably even to leporine superfoetation (the female hare's ability to become pregnant again before the birth of an earlier set of leverets).



Hunting: bronze dagger inlaid with silver showing a hunting scene on its blade, 1600–1550 BC, from Mycenae, Ashmolean Museum, Oxford

Although during the Classical period hunting parties had been small, Alexander's conquests enabled the Greeks of the Hellenistic period to indulge in vast hunts like the Persians, whose game parks were imitated especially in Seleucid Syria. "Hunt clubs" appeared in Macedon for upper-class males and, for the royalty of the Successor Kingdoms – in imitation of oriental predecessors – hunting tropies enhanced prestige. There is evidence too from the 3rd century BC of hunting as a form of pest-control, when, on the advice of the Delphic oracle, the inhabitants of the island of Astypalaia acquired hounds and caught within a single year over 6000 hares, descendants of two introduced from Anaphe some years before.

For the Roman period the main sources are the *Cynegeticus* of Arrian (*c.*AD 86–160), a section (5. 17–86) on hunting in the slightly later thematically arranged dictionary (*Onomasticon*) of Pollux and, in the early 3rd century, an often fanciful hexametric poem in four books (*Cynegetica*) falsely attributed to Oppian which mentions a huge variety of animals from the elephant and rhinoceros to the hedgehog. Arrian, writing under the pseudonym of Xenophon the Younger, is primarily concerned with updating the work of his predecessor by giving information on a Celtic breed of gazehound, probably a type of greyhound unknown to the Classical Greeks, which transformed the hunting of hares. It was now coursing on horseback rather than hunting on foot, the principal aim being the pleasure of the chase rather than the capture of the animal: indeed Arrian proposes that the hare always be given the opportunity to get clear of its form and claims (16. 5–7) to have often himself saved a hare that had run well, a point on which he specifically criticizes Xenophon, who says only (*Cynegeticus*, 5. 14) that "lovers of the chase leave the very young leverets for the goddess (Artemis)". A further innovation in hunting at this period seems to be the use of a cord with brightly coloured feathers to frighten game towards nets. The *venatio* of the amphitheatre so enjoyed by the Romans was not to Greek taste, but hunting became a military duty both to provide wild animals for the games and to protect local livestock.

In Byzantium the rural population continued hunting and fowling for the table, and the former also for protection of livestock, with little change in techniques. The upper class hunted for pleasure and for military training, most enthusiastically in the 12th century when Constantine Manasses and Constantine Pantechnes, among others, wrote *ekphraseis* (descriptions) of the sport. Hunting imagery formed, as in the East, an important element in imperial symbolism. Three emperors (Theodosius I, Basil I, and John II Komnenos) are all reported to have lost their lives in this pursuit; Liutprand (*Antapodosis*, 3. 25) attributes Romanos I Lekapenos's rise to power to his single-handed slaying of a lion; and Andronikos I had himself depicted as a hunter cutting up and cooking venison and wild boar. Aristocrats hunted deer, bear, and boar on horseback both in the wild and, especially from the 10th century, in imperial game parks. The principal weapon was the spear, while dogs and even cheetahs and leopards were trained for the hunt. Most popular among smaller game were hares and quails.

Falconry, although it had been practised from the late Roman period, became an aristocratic enthusiasm chiefly again in the 12th century. Falcons and goshawks, especially from Georgia, were the preferred birds. Various manuals on the subject were produced including the *Hierakosophion*, attributed to the late 14th-century Demetrios Pepagomenos, which deals expertly with breeding, training, and diseases and contains some remarkably precise observations on ocular worms.

During the Tourkokratia, and for a considerable time after, hunting and fowling were perforce entirely utilitarian, the major changes being the addition of the gun to the hunters' weaponry and the greatly reduced use of both hound and horse. In the 20th century hares were still the commonest

quarry, while deer and boar were shot in the north of the country. Fowling was completely replaced by shooting, mainly of partridges, woodcock, pigeons, quails, ducks, and geese. Until the mid-1980s laws governing gun-licensing were commonly flouted, headlights illegally used to dazzle game, and closed seasons for hunting poorly enforced. Since then some stocks have improved.

Hydra

Aegean island

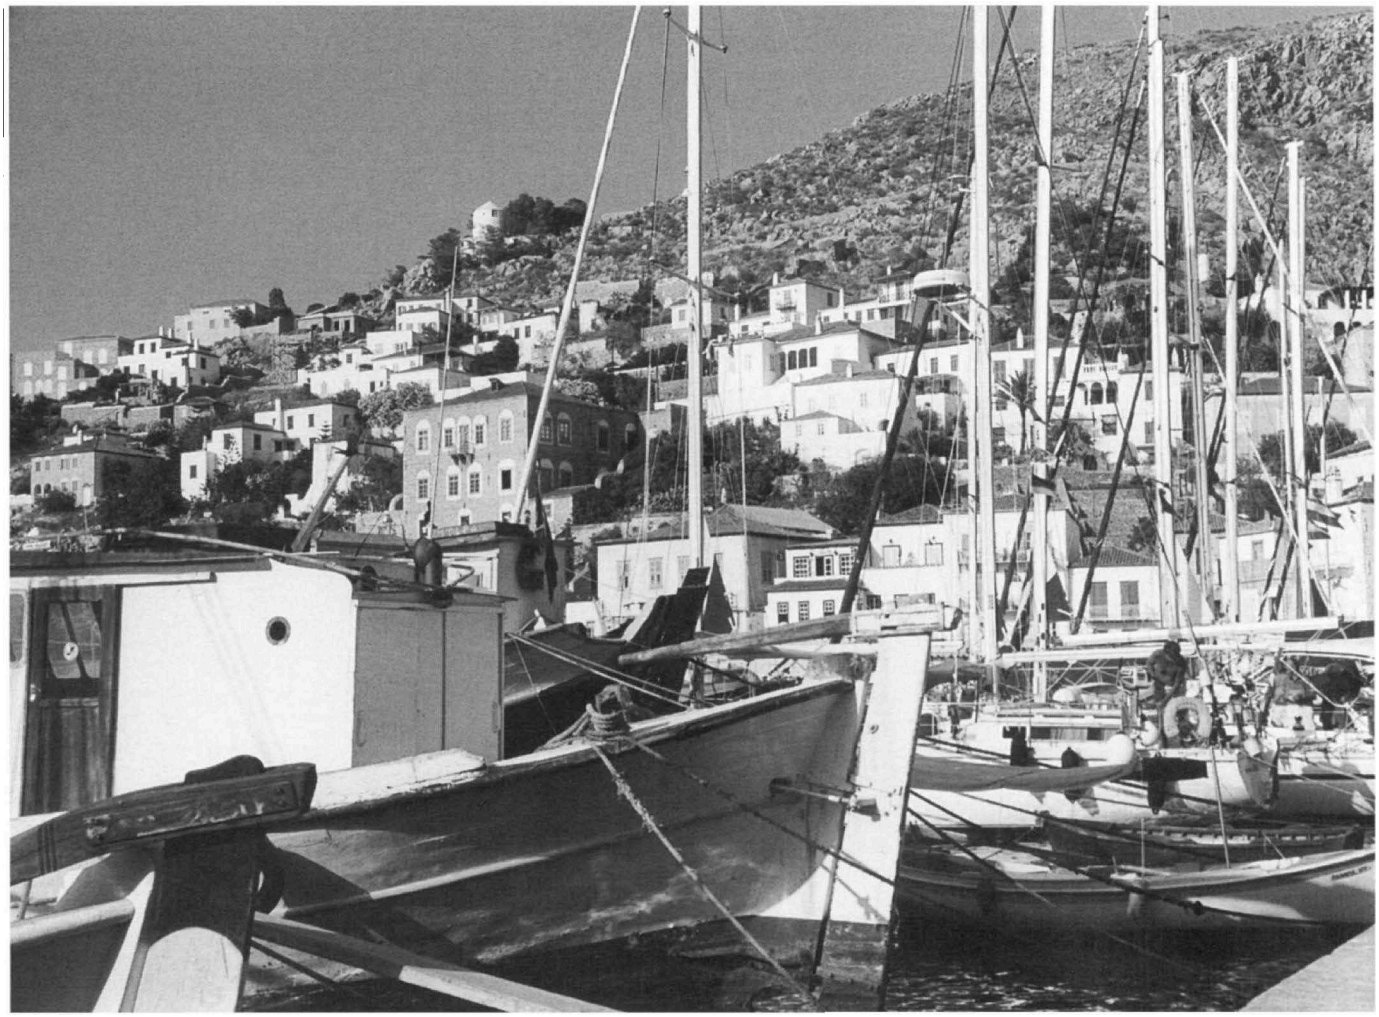
Hydra is located near the mouth of the gulf of Argos, separated by a 6-km-wide strait from the eastern Peloponnese. It is 20 km long and between 1.5 and 5 km wide. Hydra is mountainous and only a minor part of the land is arable. According to legend, water used to be abundant on the now almost waterless island. Some have even attributed the name of the island to that fabled abundance. In the past Hydra was covered by pine woods, but today they have diminished. The island has several monasteries, but many of them are abandoned. Nowadays the island is a renowned summer resort due to its natural beauty and proximity to Athens.

In ancient times Hydra was an unimportant but inhabited place, as archaeological findings reveal. It is not known exactly when its modern residents settled there. But it is commonly agreed that in 1460 and later many Greek-Orthodox Albanians, under threat of persecution by the Turks, were forced to retreat to the precipitous isle for security reasons. These Albanians were descendants of the Albanians brought by the despots of Mistra, Manuel Kantakouzenos and Theodore Palaiologos, to the Pelopponese in order to supplement the populace decimated by the Turks. The Albanian settlers on Hydra initially attempted to raise cattle and cultivate the land, but the surface was so rocky that it scarcely yielded common vegetables. Because of the infertile land and the steadily increasing population, the islanders turned to fishing in the waters of the Peloponnese and Attica in order to support their families. This activity came to an end with the Turkish invasion of the Peloponnese during the 16th century. In fear of Turkish atrocities, many Peloponnesians fled to Hydra and remained there permanently.

Over the years, Hydra became a haven for persecuted Greeks, including rebels from Epirus, Souli, Euboea, Asia Minor, and Attica. Many of them founded family dynasties. More refugees came to the island during the 16th and 17th centuries when raids by pirates and atrocities by Turks, in response to help given by Greeks to Venice in its wars against the Ottomans, devastated many Greek regions. The absence of adequate resources on the island forced the Hydriots to trade with the neighbouring Peloponnese and Cyclades in order to supplement their income. This trade required ships, rather than small boats, and consequently a large number were built. With the signing of the Treaty of Carlovitz (1699) between the Sultan, Venice, Germany, and Poland, Hydriot ships were free to sail not only to nearby waters but also to the open sea, as the immediate fear of Turks had disappeared. Through trade the islanders became first-class navigators and wealthy. Hydriots travelled not only in the seas of the Ottoman empire but also to many western European and Russian ports. Their trade consisted primarily in transporting the produce of the Ottoman empire to other areas of the Mediterranean, and in bringing home cargoes of manufactured articles. The chief export was grain, not only from the plains of the empire but also from abroad. Hydriots and Spetsiotes had a virtual monopoly of the trade in Russian wheat.

During the campaign of the Orloff brothers against the Sublime Porte (1768–74) Hydra refused to take part in the war against the Ottomans and subsequently was bombarded by the Russians. The business of the islanders greatly benefited from the Treaty of Kutchuk Kainardji (1774) that marked the end of the war, and also from the favour shown by the sultan to the island because of its stand against the Russians. Hydriots gained the right to arm their ships in order to defend themselves from pirates, a privilege that turned the island into a great naval power. Moreover, subsequent agreements permitted Hydriot ships to raise the Russian flag, rendering both the ships and their owners immune from any kind of Turkish interference or persecution. During the Napoleonic Wars most Hydriots ignored the continental embargo imposed by Great Britain on France and became very wealthy in the process. They were able to extend their commercial and shipping business all over the Mediterranean, Atlantic Ocean, and even to America. During the war between Russia and the Ottoman empire (1807), empty assurances by the Russians tempted the islanders to revolt against the Turks. The consequent settlement between the two enemies left Hydra defenceless and at the mercy of the Turks. A disaster was avoided by the efforts of Evgenios Voulgaris, the *kodjabashi* (headman) of the island, who actively opposed a revolt against the sultan.

On the eve of the Greek War of Independence (1821) Hydra was the richest region in Greece. It had a population of 26,000 and more than 100 large, armed vessels. However, with the end of the Napoleonic Wars, the islanders' trading operations fell



Hydra: the harbour front is distinguished by a number of rich merchants' houses dating from the late 18th century

into recession. The Society of Friends (*Philiki Hetaireia*) had for several years conscripted volunteers from the island, but by the start of the war the notables were opposed to it, whereupon Captains Antonios Oikonomou and Lazaros Kountouriotis overthrew the authorities and proclaimed a revolution. By public demand, the notables finally took part in the fight for independence. The contribution of Hydra to the War of Independence was huge. Together with Spetsai and Psara, it not only provided a fleet well trained in fighting but also valuable financial assistance. Hydra produced heroes such as Captains Andreas Miaoulis, Iakovos Tompazis, who destroyed the Turkish navy, and Kountouriotis, who committed all of his belongings to the war. Such were the achievements of the island that it was aptly named the Greek Venice and Little England. The acknowledgement of its contributions to the War of Independence came in 1844 when the first National Assembly in Athens granted to Hydra alone the privilege of electing three members of parliament. During the administration of Count Kapodistria, when there were differences over reconstruction and compensation for lost ships, partly due to the authoritarian style of the governor, Hydra became an anti-Kapodistria centre and revolted against him. In the following years the island lost its economic power and Syros became the chief centre of commerce.

Hydra possesses a rich cultural tradition as it is the birthplace of several famous artists including the painters N. Nikolaou and P. Tetsis and the painter-architect-sculptor Nikos Hadjikiriakos-Ghikas (1906–94). Since 1939 the School of Fine Arts of the National Technical University has had a department in Hydra at which many prominent artists have taught. A number of well-known painters have been attracted by the natural beauty of the island and have made it their permanent residence.

DIMITRIOS GKAMAS

Summary

This island near the mouth of the gulf of Argos had an undistinguished history until the Tourkokratia (1453–1821) when it became a haven for persecuted Greeks from elsewhere. The islanders began to trade widely and acquired great wealth and a fleet of fighting ships with well-trained crews. They were therefore well placed to make an important contribution to the War of Independence in the 1820s. The island is now an artists' colony.

Hymnography

The history of Greek hymnography encompasses the devotional and liturgical poetry of paganism and Orthodox Christianity, as well as Byzantine parahymnography. The first examples of hymnography to survive in their entirety are the *Homeric Hymns*, hexameter compositions that were presumably sung by soloists as preludes (*prooimia*) to heroic epic. Pindar and Bacchylides were early composers of two types of choral hymns: paeans, which were sung by soldiers, in private social life and at public festivals; and processionals (*prosodia*), sung as part of the pageantry that could precede a sacrifice. Examples of hymns written to accompany the sacrifices themselves survive in Hellenistic or Roman inscriptions on temple walls. Other complete and fragmentary texts from these later periods, accompanied in exceptional cases by musical notation, have been preserved in manuscripts and papyri. These range from the *Orphic Hymns* (of around the 2nd century AD) – 87 poems from Asia Minor that constitute the only surviving ancient Greek hymnal – to a papyrus fragment of the late-3rd century AD containing the first Christian hymn to have survived with its music.

With the exception of this latter composition in praise of the Holy Trinity and a few other such hymns without musical notation, it is difficult to discern the boundaries between Christian hymnography, psalmody, scripture, and homiletics prior to the 4th century. Although scholars have found abundant hymnic material in the New Testament and deuterocanonical or apocryphal texts, they have generally been unable to identify its provenance or liturgical use. The highly poetic Easter homily of Bishop Melito of Sardis (2nd century), which some have seen as a precursor to the works of Ephraim the Syrian and Romanos the Melodist, may similarly contain echoes of contemporary hymnody. Two hymns by Clement of Alexandria, on the other hand, are probably non-liturgical compositions.

Following the legalization of Christianity, the pressures of pervasive heresy and large numbers of new converts led the Church to regulate its worship by defining a canon of scripture, assigning the performance of chants to ordained specialists, and suppressing all but the most venerable *idiotikous psalmous* ("private psalms"). As a result, only a few ancient hymns – for example, the *Phos Hilaron* for evening prayer – remained in services that were coalescing around presidential prayers and biblical psalmody, the singing of which had recently been popularized by the ascetics of the Egyptian desert. Unlike the monks, who would recite the Psalter as a contemplative exercise, urban Christians chanted select psalms or canticles with newly composed refrains. Those of one sentence or more were called *troparia*, examples of which include the *Trisagion Hymn* and "Only Begotten Son", a summary of the Nicene Creed attributed to Justinian.

Despite the efforts of Gregory of Nazianzus and Synesius to write extended hymns in quantitative metres, most Christian hymnography in late antiquity employed accentual metres and a relatively popular form of the Greek language. Moreover, the development of hymns more complex than *troparia* in the 5th century appears to have been partially in response to the isosyllabic metrical sermons of such Syriac authors as St Ephraim. Two forms of Byzantine hymns seem especially dependent on Syriac precedents: the isosyllabic *kata stichon* hymns; and the kontakion, which came to maturity in 6th-century Constantinople with the works of St Romanos the Melodist. A kontakion consists of at least one preface (*proimion* or *koukoulion*) introducing the subject of the hymn and its (presumably congregational) refrain, followed by a series of metrically identical strophes (*oikoi*) united by an acrostic that may render the alphabet, the author's name, or the feast commemorated. In keeping with their origins as poetic sermons, kontakia were originally performed paraliturgically between the offices of an all-night cathedral vigil (*pannychis*).

Exchange between the liturgies of the Holy Sepulchre and the monastery of Mar Saba following the destruction of Jerusalem in 614 gave birth to a flourishing school of hymnography represented by such luminaries as Sophronios of Jerusalem, Andrew of Crete, John of Damascus, and Kosmas of Maiouma. Disregarding monasticism's traditional suspicion of hymnody and melodious psalmody, these *melodoi* (hymnographers composing their own melodies) prolifically composed *stichera*, *kathismata*, and canons to adorn the psalms and canticles of the Palestinian monastic rite on Sundays and the major solemnities of the liturgical year. *Stichera* and *kathismata* are *troparia* that may possess a unique melody (*idiomelon*), or be contrafacta (*prosomoia*) of a standard tune (*automelon*). A comparable system of model melodies is found in canons, long multi-stanza poems consisting of up to nine "odes" of *troparia* farcing (being interpolated into) two or more of the nine canticles of the morning "canon of psalmody". Each ode of a kanon, which is somehow thematically related to its host canticle, features a model stanza (*eirmos*) followed by metrically identical *troparia*.

Sabaïtic hymnography was decisively introduced to Constantinople in 799 when the monastery of Studios adopted the Palestinian Liturgy of the Hours at the behest of its abbot, St Theodore, who was himself a *melodos*. As Studite monasticism spread from southern Italy to Kievan Rus, hymnographers of the Studite school – including Theodore, his brother Joseph of Thessalonica, Theophanes Graptos, Joseph the Hymnographer, Kassia, and many others – systematically filled gaps between the festal propers of the older Sabaïtic collections. The completion in the 11th century of cycles of hymns covering each day of the fixed and movable cycles of the liturgical year established the corpus from which have been extracted the 15 volumes of proper texts currently employed by the Orthodox Church. One result of these developments was a shift towards hymnography as the favoured medium for communicating theology in Orthodox worship, the impact of which was magnified by the growing tendency to read prayers silently and omit the biblical texts that Sabaïtic hymns were

written to accompany. Another consequence was the rise of Byzantine parahymnography, that is didactic or satirical poems employing the metres of well-known hymns to enhance their memorability.

From the twilight of Byzantium until the present day, the occasional creation of new feasts has required the composition of hymns in established genres by writers ranging from Theoleptos of Philadelphia and Symeon of Thessalonica to Alexandros Papadiamantis and Metropolitan Nikodemos (Vallendras) of Patras. Hymns composed outside the Sabaïtic mainstream include vivid and presumably non-liturgical poems by Symeon the New Theologian, as well as a wide variety of late and post-Byzantine *troparia* for the festal psalms of the Palestinian all-night vigil (*agrypnia*). Relatively few of the latter – which include short Trinitarian *anoixantaria* (opening) for Psalm 103, the popular *Lamentations* for the singing of Psalm 118 during matins on Holy Saturday, and more substantial compositions in 15-syllable verse – are included in modern service books. Instead, many appear in musical manuscripts or printed chant books in settings by such composers as John Koukouzeles and Manuel Chrysaphes.

Hypatia *c.*370–415

Mathematician and philosopher

Among the female mathematicians of antiquity, Hypatia is certainly the best known and, sadly, the only one about whom we have information other than a mere reference. She has attracted enormous attention in modern times and has been exalted to legendary proportions especially by scholars who study the gender difference in scientists. Perhaps much of our idealized image of her has been influenced by the romantic novel *Hypatia, Or New Foes with an Old Face* (1853), by the Classical scholar and historian Charles Kingsley.

There was also a biography written in 1720 by John Toland, a deist. The author uses Hypatia's example in an effort to defame Christianity and especially Cyril, the archbishop of Alexandria, whom he holds responsible for Hypatia's tragic death. In chapter 47 of his influential and widely read *The Decline and Fall of the Roman Empire* (1776–88) Gibbon uses eloquent and emotional language to describe both the beauty and tragic events of Hypatia's death, holding responsible the Christians and their archbishop, Cyril. Whatever the events in relation to Hypatia's murder in AD 415, one thing is certain: they became a chief source of her immortality to the extent that 415 is often considered the seminal date that divides paganism from Christianity. If the closure of the school of Athens by Justinian in 529 is not a suitable conventional date for the end of paganism, then 415 is certainly a good alternative.

There are several primary sources about Hypatia's life. One is a long, but unfortunately in some respects self-contradictory article in the *Suda*. Others are John Malalas's *Chronographia*, Socrates' *Historia Ecclesiastica*, and the letters sent to her by her most famous student and friend Synesius, later bishop of Ptolemais. All these can be found in Migne's *Patrologia Graeca*. Other sources are John of Nikiu's *Chronicle*, the *Historia Ecclesiastica* by Philostorgius, and a brief reference to her in Photios's *Bibliotheca*, in his summary of Damascius' (lost) *Life of Isidorus*. The above-mentioned sources, all Christian and generally favourable to Hypatia, fail to agree on who is to blame for her death.

There is no firm date for Hypatia's birth but it is generally given as around AD 370. This is partly because eclipses described by her father, the astronomer Theon, have been dated to AD 364. Hypatia was a chaste person and a respectful teacher of mathematics and Neoplatonic philosophy in Alexandria. Wearing the cloak of a rough cynic philosopher she taught in public to an audience consisting of both pagans and Christians (Synesius himself was a pagan who later converted to Christianity, to become bishop of Ptolemais). According to the *Suda*, Hypatia wrote commentaries on Diophantus, on the *Astronomical Canon*, and on Apollonius' *Conics*. (The text in the *Suda* has been variously interpreted; it may mean, for example, that there were just two commentaries, the one being Diophantus' *Astronomical Canon*. For various reasons, however, it seems safer to assume that it refers to a separate work of Diophantus, presumably the *Arithmetica*, and then to Ptolemy's *Almagest* or the *Handy Tables*.) Hypatia also collaborated with her father on a commentary on book 3 of Ptolemy's *Almagest* since the text includes the phrase "this book was revised/edited (*paranagnostheisa*) by the philosopher, my daughter Hypatia". A quotation in one of Synesius' letters stating that Hypatia helped him to design an astrolabe shows the breadth of her knowledge. In yet another letter Synesius requested her to construct a hydrometer (*hydroskopeion*) according to his detailed instructions.

There is no doubt that Hypatia was the leading mathematician of her time. However, it seems that no specific original contributions to mathematics or astronomy can be attributed indisputably to her. Whatever her contributions, if any, they are either lost or perhaps diffused in her commentaries. Like her father, she is mostly remembered for her teaching.

The most detailed and reliable account of Hypatia's death was narrated by the historian Socrates some 25 years later. At the time described, there was considerable tension and rivalry between the Jews and the Christians of Alexandria. In those difficult times the prefect of Alexandria, Orestes, and the archbishop, Cyril, known for his harsh way of dealing with the heretic Nestorius, opposed each other. Some 500 monks from the monasteries in Nitria, referred to as savages by the *Suda*, came into town to support Cyril. They accused Orestes (who had been baptized a Christian) of being a pagan and sacrificing to the Greek gods in spite of the emperor Theodosius' ban of all pagan cults. When a monk named Ammonius was tortured to death for hurling a stone at the prefect, Cyril and many moderate Christians found this action intolerable. The pro-Cyril mob turned against Hypatia, Orestes' close associate. Although the prevailing opinion is that Cyril was directly to blame, there is no evidence that he actually gave any such orders or knew of the mob's intention. Indeed, John of Nikiu is even favourable to Cyril, calling Hypatia a pagan magician, and Philostorgius puts the blame on a pro-Arian mob. Be this as it may, Hypatia was stripped and violently dragged to the cathedral where she was killed and subsequently cut to pieces with sharp oyster shells. Her dismembered body was then taken to a location called Dog's Place (Kynarion) and finally burned.

Biography

Hypatia was born in Alexandria about 370. Largely educated by her father Theon, she went on to teach mathematics and Neoplatonic philosophy in Alexandria. She also wrote commentaries on earlier mathematical works. She met a violent end at the hands of a mob in her native city in 415.

Icon

The term "icon" is derived from the Greek *eikon*, meaning an image or picture. It is still used in this sense in modern Greek. In a more restricted sense, an icon is a religious image depicting either holy figures or narrative scenes. As a holy image, the icon is the paramount statement of the Orthodox faith, a reflection and statement of the divine.

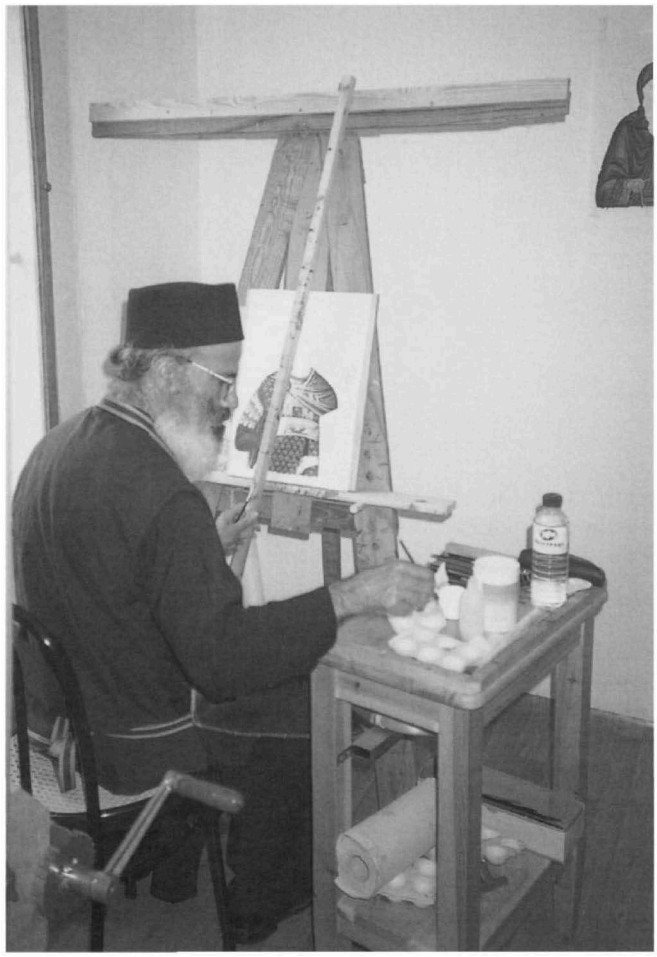
The holy subject matter can be depicted in a variety of artistic mediums, such as ivory, enamel, mosaic, and fresco. In a narrower sense, an icon is a cult image shown on a wooden panel. Icons in the sense of panel paintings come in a variety of sizes, ranging from small panels no more than 10 × 15 cm to panels ten times larger. The wooden panels may be combined to form diptychs or triptychs. Some icons are painted on both sides (bilateral icons).

The wood chosen for Byzantine icons includes cypress, lime, elder, cedar, and pine. The panel is usually made up of several planks of wood that are held together by strips of wood nailed onto the back, while the front is sometimes hollowed out to create a frame around the outside. Several layers of gesso, consisting in the main of chalk, are applied to the wooden panel to create a smooth surface for the paint. At times, a piece of woven cloth is placed over the wood and beneath the gesso to prevent irregularities in the wood from appearing on the surface of the icon. The next step is the preparation of an outline drawing. Those areas of the icon that are to receive gold leaf are coated in a bole (a layer of clay, usually red). In the early Byzantine period the pigments were suspended in wax encaustic. After iconoclasm the predominant binding medium is egg tempera (the yolk of an egg). Sometimes, a cover consisting of different metal plates is laid over the wooden icon. In some instances the plates cover the entire figure apart from the hands and face; in others it is only the background that is concealed.

Some icons combine painting with relief sculpture. In these, which date in the main from the 12th and 13th centuries and appear to originate in northern Greece, the saint is shown in relief and is surrounded by painted scenes from his or her life. Meral icons were also made in the Byzantine Period, but few survive. The Treasury of San Marco in Venice contains an 11th-century metal icon in high relief of St Michael which is elaborately decorated with enamel. A number of metal icons in low relief survive from Georgia. Another subgroup are steatite icons. In the late Byzantine period, icons were also made in mosaic. Minute tesserae, consisting of glass, semiprecious stones, or gilded copper were added to a bed of wax or resin on a wood support.

The making of icons is considered a spiritual activity. Manuals for the guidance of icon painters survive from the post-Byzantine period, such as the 18th-century *Painter's Guide* of Mount Athos by Dionysios of Phourna. Icons are displayed in churches, homes, and public places – a statement that was probably as true for the Byzantine world as it is for present-day Greece. In an Orthodox church icons are displayed on icon stands (*proskynetaria*) or on the iconostasis, a tall opaque barrier separating the sanctuary from the nave. The iconostasis developed only in the late Byzantine period and found its fullest expression in the Russian and post-Byzantine Greek Orthodox Church. The iconostasis developed out of the templon, a transparent sanctuary partition that consisted of a low barrier and columns supporting a transverse beam. Icons, which often depicted pivotal scenes from the life of Christ, were placed on top of the beam known as the epistyle. It was only at certain points of the liturgy that the altar was concealed from the congregation by curtains being drawn. The templon was transformed into the iconostasis when icons became permanently fixed in the spaces between the columns.

Different types of icons are venerated in the Orthodox Church. They can be classified according to subject matter and their presumed origin. Byzantine and modern icons typically show Christ, the Theotokos (Mother of God), saints, and narrative scenes from the life of Christ or the saints. Among the holiest icons in Orthodox belief are those believed to have come into existence without human agency. These are known as *acheiropoietos* icons ("made without hands") which, for instance, depict the imprint of Christ's face on a cloth. An example are icons showing the Mandylion of Edessa, a relic that in the 10th century was sent to Constantinople where it stayed until the conquest of the city in 1204 by the participants of the Fourth Crusade. Another type of especially holy icon are portraits supposedly painted with the authorization of the person portrayed. The most famous example of this type of portrait is the image of the Theotokos and the Christ Child attributed to St Luke. Although a number of icons attributed to St Luke exist in Italy and elsewhere, only one is recorded for Constantinople: this is the icon of the Theotokos Hodegetria, which was kept in the Hodegon monastery. Even though lost,



Icon: icon painting is a living tradition on Mount Athos

numerous copies record the appearance of this cult image: the Christ Child is shown seated on the left arm of the Theotokos who points at him with her right hand. This icon was the most important cult image in Constantinople, probably from about the 11th century onwards, and formed the centre of an elaborate cult (see below).

The icon depicting the portrait of a saint finds its origin in Late Antique funerary portraits painted in encaustic, of which the best-known examples originate from the Fayum in Egypt. The earliest extant icons – a number of 6th- and 7th-century icons kept in the collections of the monastery of St Catherine at Mount Sinai – resemble the Fayum funerary portraits in both format and technique. There are not many icons from the pre-iconoclast period. The early icons at Sinai survive partly because of the area's desert climate, and partly because the Sinai peninsula no longer formed part of Byzantine territory at the time of the iconoclast controversy.

The use of figurative images was a concern to theologians throughout the early Christian period. Central to this debate was the Old Testament prohibition against "graven images" (Exodus 20:4–5). In Byzantium the Old Testament prohibition had particular consequences for depictions of Christ who, according to Orthodox belief, was both human and divine in nature. These concerns, alongside other factors of a political and social nature, led to the iconoclast controversy in the 8th and 9th centuries. From the middle of the 720s to 787 and again between 815 and 843 the use of figurative images was banned. Icons were destroyed and icon painters, often monks, persecuted.

Both the opponents of image veneration, the iconoclasts, and the supporters of icons, the iconodules, developed sophisticated theological arguments in support of their views. The iconoclasts argued that images of Christ, who, in his divine form, could not be depicted, undermined the belief about the two natures of Christ. Another iconoclast argument was that the use of images was idolatrous because both the person depicted and the material of which the image was made were venerated. By contrast, iconodule theologians, such as John of Damascus, rebutted iconoclast arguments by arguing that the icon in its materiality was distinct from the person depicted (prototype). It was the prototype, or the reality behind the image, not the icon itself that was venerated. The theology developed in support of image veneration during iconoclasm firmly established the central role of icons in Orthodox belief.

The use of icons proliferated after the end of the iconoclast controversy. Icons survive in increasing numbers from the 12th century onwards. A famous example is the icon of Vladimir, showing the Theotokos holding the Christ Child in a way that emphasizes motherly love. New types of subject matter developed. A late 12th-century icon in the Sinai collection depicts a text written by the Sinaite monk John Klimakos, known as the *Heavenly Ladder*. This icon shows monks ascending a ladder towards spiritual perfection while other monks are pulled off the ladder by black demons. From about 1200 onwards some icons combine the image of the saint with depictions of scenes from his or her life on the border of the icon; these icons are known as *vita* icons. Calendar icons depict the saints venerated during a particular month of the year (menologion icons).

Believers express their veneration of icons by kneeling in front of them, lighting candles, kissing the image, and making the sign of the cross. *Tamata*, offerings frequently in the shape of metal plaques referring to a wish granted or an illness cured, are sometimes attached to the image. In Byzantium the miraculous powers of icons were harnessed by using them as palladia. They were carried in battle or displayed on the walls of a city during a siege. The carrying of icons in religious processions is attested for the Byzantine period and persists in present-day Greece. In Constantinople, for instance, the icon of the Theotokos Hodegetria was displayed publicly every Tuesday, an event that is referred to in several written sources. According to the Spanish traveller Pero Tafur, who visited Constantinople in the early 15th century, the icon was carried by members of a confraternity dressed in red robes. Onlookers were overcome with emotion and handed bits of material, described as cotton wool, to the confraternity members, asking them to bring it in contact with the icon in order to sanctify the material.

Iconoclasm

Iconoclasm forbade the making or "veneration" of images, whether of God or of the saints. Condemnation of holy images was nothing new in Christian thinking: it was dominant in the early Church, and the elements that derived from Jewish law were reinforced by Greek philosophy, from the Presocratics to contemporary pagan Neoplatonic thinking. Such expressions as Eusebius' *noera ousia* ("spiritual essence") and Clement of Alexandria's *noete ousia* ("immaterial essence", a term ultimately derived from Plato) represent the Greek side of Christian thinking and helped expand the simple biblical interdiction into a range of theological arguments.

The rise of iconoduly (icon veneration) is poorly documented. Veneration of the icon for itself – a particular image at a particular shrine – had only recently (from the 6th century on) become a major phenomenon and such pro-icon theologians as Leontios of Neapolis of the late 6th century faced considerable opposition. But however strongly felt, the option had remained a matter of personal choice. The public setting up of images by the emperor did not change this, but forbidding of them did.

Icon veneration took very ambiguous forms: prostrations, incense, hymns chanted, prayers addressed to the image itself; the image, not the saint behind it, made godparent of one's child, etc. The emperor Leo III (716–41) reckoned that this was tantamount to idolatry, and by an edict of 730 he forbade it. The iconodule historians nearest to the time whose work survives, Theophanes the Confessor and the patriarch Nikephoros (806–15), say that it was the eruption of Thera in 726 that determined Leo III's decree; he was right, they say, in assuming that God was angry, but his erroneous diagnosis of the reason led to even worse impiety. The evidence suggests that the veneration of images would have remained "impiety", and not become "heresy", if it had not been perceived as having political potential.

Few historians still hold the view that iconoclasm was the most important affair of the period, with every Byzantine deeply involved in it, except for a servile episcopate. In fact the Establishment and the army took it in their stride; most monasteries were in communion with the iconoclast official Church; and even at the time of Constantine V's "war on monks" many, probably most, monks were unquestionably in communion with it. St Theodore of Stoudios, the most redoubtable of the iconodule apologists, notes indignantly that rejecting icons "was not at first recognized for heresy, and still seems to some only moderately wrong" (he himself discovered how wrong it was only when he was looking for an issue over which to fight the patriarch). The iconoclast emperors enjoyed exceptional popularity with the urban masses. Not everyone became iconoclast, they simply accepted the situation; no doubt most people continued to venerate their own icons in their homes.

Besides the bias of the sources the other trap that the subject offers is reducing the question to one of theology and "persecution". Such an issue was bound to become theological, but Leo's concern was with practice; the iconodule opposition turned the question into a purely theological one: could God be represented? The answer was that according to the "new dispensation" (Christianity as against "the Law", i.e. Judaism), God incarnate could be depicted. Iconodule theologians reserved *latreia* ("worship") for God, allowing icons only *proskynesis*, which may be translated as "adoration", addressed, in theory, not to the image but to the person it stood for.

When he decided to forbid the veneration of images, Leo III held public meetings to explain his policy and win support for it: "He summoned all his subjects to a rally, and presiding in their midst like a roaring lion, belched forth from his angry heart, fire and sulphur, like Mount Etna, and pronounced these grievous words: 'The making of icons is a craft of idolatry, they may not be worshipped'" (*Vita Stephani*, chapter 9). Constantine V also sought support from the people:

> The tyrant ... shouted "My good luck has won the day and God has heard my prayer." The crowd cheered and shouted: "When did God ever close His ears to you?" Overjoyed he said with a great laugh: "The Lord has discovered to me the man I was looking for. Shall I show him to you?" The crowd roared back "Punish him! Kill him! Burn him, for disobeying your orders!"

Emperor and people had had similar dialogues in the circus in Rome. Constantine did much to raise living standards for the people in Constantinople.

When Leo initiated iconoclasm by removing an image of Christ from one of the palace gates, "distressed crowds in the capital destroyed a few of the emperor's men who were taking down the image, and many of them were punished for their piety with amputations, exiles, and confiscations". In fact, these were normal legal proceedings after a riot and, according to the historian, no one was condemned to death.

The most famous iconodule "martyr" was St Stephen the Younger (died 764), who was involved in a plot to overthrow the emperor. The punishments or "tortures" inflicted on the "martyrs" and "confessors" were, except for the tattooing of the Graptoi brothers, laid down in the law codes. Iconodule zeal manifested itself through lawbreaking, when it did not involve treason. The iconodule patriarch, Nikephoros, deplored law-abiding under the iconoclast emperors: too many of the clergy, he said, "uphold political laws and recognize civil authorities ... This is not Jacob's heritage, nor are such the ways of those whose dogma and thinking are ordered by piety." The undermining of army morale appears to have been one approved strategy of militant iconoduly: St Theodore of Stoudios, consulted as to whether the canonical condemnation to three years' excommunication of any soldier who killed an enemy on the battlefield should be applied, said that it must: "If they don't want to be excommunicated let them stop killing" (Letter 51). But both attempting to overthrow rulers and inciting the military to disobedience and even desertion in

time of war constituted major offences, the penalties for which, recounted with religious horror by the victims' supporters, were those established by the law.

"Iconomachy in action is monachomachy", said Peter Brown. At no time, under iconoclasm, were all the monasteries under attack. For Leo III, the *Ekloge*, the law code he promulgated, is evidence enough that monks as such were not under attack (cf. chapter 7.1: allocating guardianship of orphans whose parents had not named a guardian to religious establishments explicitly including monasteries; chapter 8: conferring freedom on a slave who has become, with the knowledge and consent of his master, a cleric or a monk). Iconoclasm was given dogmatic status by the Council of Hiereia in 754. But icon veneration was restored in 780 and confirmed at the Second Council of Nicaea in 787.

During the second period of iconoclasm (815–43) communion with the patriarch was the test of Orthodoxy, and the operation was made as easy as possible: "All we ask of you is to commune once with Theodotos [the patriarch] ... then you will be free to go out, each to his own monastery, keeping your own belief and opinions" (*Vita Niketa Medikion* 824). It is quite clear from the evidence of his own *Vita* that the austere Ignatios, the future patriarch, was abbot of a monastery in communion with the iconoclast official Church. War was not waged on monasteries so long as they were not out to provoke trouble, except under Constantine V (741–75). He designated monks officially as "the unnamed" (*amnemoneutoi*, a technical term from the *Ekloge* law code for a son disinherited for misbehaving towards his parents), and staged in the Hippodrome a ritual desecration of the monastic habit (after 763: *Vita Stephani* chapter 40). It has been suggested that his aim was to recover potential soldiers, but one might go further: at that time of desperate need, the monks did not supply food, but consumed it; this body of men, several thousand strong and exerting great influence, isolated itself completely from the war effort, and expected to be supported. Nonetheless Constantine did not wage war on monasticism for the first 20 years of his reign, and the apparently sudden change might well be related to the plot referred to above. Whatever the answer, at no point were all the monasteries in difficulties even with him.

Why did iconoduly win in the end? Could it be because of the two female regents, Irene in 780 and Theodora in 842? Not because women were particularly given to veneration, but because these two both loved power. Backed by power groups condemned to remain in the background, such as well-chosen civil servants – eunuchs, ideally – and churchmen, they could hope to enjoy it; the alternative, entrusting their interests to a general, meant surrendering power completely. Neither empress has a dossier that suggests deep personal commitment to icons. Irene ensured for herself the support of safe elements, and once things were well in hand, treated her supporters to tax relief.

Similarly, for Theodora, almost the only fact to emerge clearly from the confusion of the sources on the "Restoration of Orthodoxy" – as the aftermath of Theophilos's death is termed – is the presence of potential male candidates, who might have kept her on as nominal "empress", but without power; and therefore she looked for support from men who could not themselves be emperor. If Irene's case is mainly deduction, Theodora's hagiographic *Life* states that, so long as her husband lived, she "dared not" allow her iconoduly to be discernible. Naturally, when it became the official policy of the throne, an appropriate image of her was diffused and some of the material has survived.

The victorious iconodules promptly fell out with the new patriarch, Methodios, and his backers ranged against the Stoudites. In due course the row was tidied up, and in successive versions of the *Life* of the great (iconodule) St Joannikios, acid remarks about prominent Stoudites are made "politically acceptable" by simply speaking of unidentified "cantankerous monks".

The measure in itself has been given a weight by modern historians that it certainly did not carry. The "age of iconoclasm" should be termed "the age of iconodule sources": Theophanes and Nikephoros, though militant iconodules, remain historians, giving far more space to foreign or dynastic affairs and natural calamities, but many of our sources are the actual weapons left over from the conflict – letters and pamphlets from the most active proponents, hagiographic accounts written to conceal the fact that the "martyr" had been involved in attempted treason, or, on the contrary, to prove that a convent had not been in communion with the "heretics". These documents come almost exclusively from the winning, iconodule side. The 368 letters of the militant and unscrupulous St Theodore of Stoudios, the accounts of the "martyrdoms" of six iconodule saints, are extremely vivid, and it is only recently that Byzantinists have begun to look at them critically.

Two tangible consequences of the iconoclast affair are recognizable. If the conflict had never arisen, art would have developed differently. If iconoclasm had won, presumably for the time being church decoration would have been very much like that surviving in a few mosques: trees, flowers, and gardens; it is also possible that more profane art would have survived, not necessarily only the Hippodrome scenes that iconoclast emperors are condemned for having commissioned. That the saints would have returned seems likely, but perhaps more willing to share the available space with other images.

Obviously icons had already found a central place in the religion of the Eastern Church, but all except a small minority adapted without any difficulty to official iconoclasm. This suggests that, if the two iconoclast interludes changed the position of icons very little, the "Restoration of Orthodoxy" was a different matter. Leo III had claimed only to enforce well-known divine commandments; converting this to a theological debate, followed by victory for the side that took iconoduly for its emblem, made dogma of a field that was formerly open to individual choice, and gave it an extraordinary new emphasis.

Identity

What it means to belong to a people, the terms used to describe this, and perceptions of distinctiveness in relation to other peoples, will inevitably vary over 40 centuries of history, and all the more so when the sense of Greek identity has at some crucial turning points been the subject of reinterpretation and reconstruction.

The centrality of language is indubitable. Some signs specific to the Linear B syllabary on a circular pebble excavated in a Middle Helladic context indicate that Greek was being written in the Peloponnese around 1650 BC. We do not, however, know what those who then spoke the language called it. The Homeric epics (of the 8th century BC, but incorporating much earlier traditional phraseology) use "Achaioi" as the main generic name with "Danaoi" and "Argeioi" as alternatives. Hittite tablets of the 2nd millennium BC mention "Achiyava" as an important kingdom while Egyptian inscriptions name the "Danaya". None of the three terms was used as an overall self-description by speakers of Greek after Homer. "Argives" and "Achaeans" became confined to subgroups.

The peoples to their east called Greek-speakers by some variant of "Ionians", because Ionians from Euboea, the Aegean islands, and the Asia Minor coast dominated trade there into the 7th century BC. Greek-speakers themselves, however, saw the Ionians rather as one of their main subdivisions. The fragmentary pseudo-Hesiodic *Catalogue of Women* of the 6th century BC presents a genealogy in which they are somewhat closer to the Achaeans, Ion being brother to Achaeus and son to Xuthus, than to Aeolus and Dorus, Hellen's other two sons.

Peoples to the west and the north of the Greek-speakers took the word "Greek" from the Romans. The reason for this choice is uncertain. The *Catalogue of Women* states that Zeus and the daughter of the first man, Deucalion, gave birth to Graecus, and later sources that Hellen, Deucalion's son, gave his name to the people previously called "Graikoi". Since no major subdivision of Greek-speakers called themselves "Graikoi", it is conceivable that what we find here is the echo of an earlier attempt to construct a common genealogy, current when cities of Euboea and the town of Graia (Oropus) opposite were founding the first Greek settlements in Italy.

Neither "Achaean" nor "Ionian" nor "Greek" became the dominant term of self-descriptive identity in Classical antiquity. In Homer "Hellene" referred only to Achilles' kingdom in south Thessaly or Phthiotis (*Iliad*, 2. 680–85). In the 7th century BC, however, Hesiod (*Works and Days*, 1. 653) speaks of all the mainland Greeks as "Hellenes". By the 6th century BC a common shrine of nine cities at Naucratis in Egypt was called the "Hellenion" (Herodotus 2. 178), while "Hellanodikai" was the name of the judges in Olympia.

The Greek-speaking world was composed of a large number of often fiercely competing city states, and, at its periphery, also some more traditional kingdoms. Thus Hellenic identity, in contrast to many others, was not based on a common political loyalty. Herodotus (8. 144) puts in the mouth of the Athenians a catalogue of what made the Hellenes one people – common blood, common language, common temples and sacrifices, and a common way of life. Since the word used for a non-Greek, "barbarian", originally meant "heterophone" (Homer, *Iliad*, 2. 867 uses "barbarophones" to describe the Carians as "of foreign speech"), language was almost certainly the most important of these. The common genealogies already referred to, the common cult centres and sacrifices associated with the Homeric pantheon, and a common way of life were indeed crucial elements in ancient Hellenic identity. Common political institutions and loyalty are not even mentioned.

What constituted the common way of life? For most Hellenes it was life in a city state, which gave citizens their sense of political identity and privilege in relation to slaves or serfs. For all, it was the values instilled by the Homeric epics: on the one hand, a close family at home, as witnessed by the *Odyssey*, a safe haven after long periods of absence, especially at sea; on the other, an agonistic or competitive approach to life in society, whether in war, debate, or athletic games, as witnessed by the *Iliad*. Homer was central to ancient Greek

education. The spread of many Homeric values to non-aristocrats helped set off major political experiments and encouraged individual achievement among thinkers, craftsmen, and artists alike.

The word "barbarian" is never used in Homer of non-Greeks as a whole. Nor is moral superiority ascribed to the Achaeans compared with the Trojans. After the Persian Wars, especially in Athenian drama (starting with Aeschylus' *Persae* in 472 BC) and Herodotus, there is a clear sense of superiority based on forms of political organization and military and cultural achievement, the first sure instance in which Hellenic identity is partly defined by opposition. Herodotus (1. 1) states that he wrote so that "the great and marvellous deeds performed, whether by Greeks or by barbarians, should not lose their renown". From the following chapters it is clear that he saw Persians, Phoenicians, Egyptians, and Lydians as cultured and clearly differentiated, yet equally "barbarians".

Although the Persian invasion (480–479 BC), resisted by a voluntary alliance of about 30 city states, proved a defining moment, consensual political unification of all the Hellenes did not follow. In the late 4th century BC Philip and Alexander of Macedon, masters of a kingdom dismissed by Hellenic political opponents as "barbarian", justified the imposition of an alliance as a means to obtain revenge against Persia, but this unity too did not survive Alexander's death.

Alexander's conquests (336–323 BC) formed another defining moment. Hellenes poured eastwards bearing their cultural values such as city life, athletics, philosophy, and art. Large numbers of non-Hellenes began to use Greek as a second language. This brought changes to the language, and loosened the connection of its use with Hellenic identity. Earlier in the 4th century BC Isocrates (*Panegyricus* 50) had already advocated that the name "Hellene" should be applied to those who shared Hellenic culture, rather than ancestry. By contrast, the other two of Herodotus' defining characteristics, a shared way of life and religion, became more important in a cosmopolitan and linguistically united world.

Political fragmentation assisted the Roman conquest, but Roman rule did not diminish the sense of a separate Hellenic identity for several centuries. The Classical revivalists of the 2nd century AD, though content to be part of the empire, were proud to be culturally Hellenes and politically citizens of their particular cities (no longer effectively "states").

Writing to the Corinthians (1 Corinthians 1:18–25) Paul contrasts Jews and Hellenes as two peoples and outlooks from either of which one might come to the Christian faith. What ultimately occurred was more radical. A people noted for its cultural self-confidence and pride in superiority over barbarians came to adopt as its own the empire of one foreign people, the Romans, and the religion, albeit universalized, of another, the Jews. The history of Greek-speakers continued under the mantle of the Romaic empire and as a new Israel.

From the 3rd century AD onwards, the growth in transcendental religion and the gradual decline of cities in an increasingly beleaguered empire led to changes first in the content and then in the self-descriptive aspects of identity. Thus by the 6th century "Hellenes" had come to mean "pagans", actively opposed by Christians. Meanwhile in a significant popular phrase one city alone, Constantinople, came to be known as "the City", mirroring the fact that loyalty was now focused on a single state, the empire of the Romaioi, "Romans" in Greek. Thus two crucial elements of later Greek identity, the Romaic and the Orthodox Christian, enter the scene, not however in their narrower contemporary sense. They were originally, both in principle and in practice, much broader than the Hellenic identity had been, spreading far beyond speakers of a particular language, aspiring indeed to universality.

If the self-descriptive elements of identity changed, there was considerable continuity in content: first, in language, second, in respect for some ancient cultural values, and third, in continued distaste for barbarians. There were several revivals of Attic Greek (as in the 2nd, 4th, and 9th centuries). More important was the influence of the Septuagint translation of the Old Testament and the original Greek text of the New Testament, which, with the hymnody of the Eastern Church they inspired, had a simultaneously conserving and formative effect on Greek, comparable to that of Luther's translation of the Bible on German and the Authorized Version on English. Equally, there was continuing respect for Classical culture among the educated. Quite as important were folk memories (e.g. of Alexander), traditions, and values among the less educated, including the continued insistence on excellence, for example, in craftsmanship. The "barbarians", who were effectively reducing the area of Greek cultural and linguistic influence, were more dangerous than ever. They were now distinguished less by language and more by their uncultured, destructive, and (in the modern sense) barbarous behaviour.

Distaste for the Franks, one of the two specific oppositional aspects of modern Greek identity, probably dates from the 8th century. There was no Frankish kingdom after the 9th century, yet even today Greeks, when seeking a pejorative term, more frequently use "Frank" than "Latin" or "Western", although either of the others would have been more natural at any later period. The Franks introduced the *filioque* into the creed long before Rome, thus challenging the Orthodoxy of Constantinople; they were also the first effectively to challenge the universality of its Christian and Romaic empire. The geographical extension of "Frank" has expanded and contracted at various times from its Franco-German core. The Crusaders' despoliation of Constantinople in 1204 cemented religious and cultural schism. Since they also claimed to be heirs of Rome, first Classicizing intellectuals and then wider circles from the 12th to the 15th centuries began to reuse the word "Hellene" in a positive, self-descriptive sense. Patriarch Gennadios used both "Hellene" and "Romaios", but "Hellene", it seems, more frequently.

The second opposition central to later Greek identity concerns the Turks. This runs even deeper. *Efrangepse* means "he has adopted Western ways" (but has not necessarily therefore ceased to be a Greek), whereas *etourkepse* means "he has become a Muslim and hence a Turk". There is also no parallel to the interchangeable popular phrases *egine thirio* and *egine Tourkos* meaning "he behaved outrageously" (literally "he became a wild animal" and "he became a Turk" respectively). Vitsentzos Kornaros's 16th-century description of a Karamanian, clearly indicating a Turk (*Erotokritos*, 2. 319–64), illustrates this:

> He believed in his sword, this is what he worshipped:
> wars, hostilities and quarrels ever he was stirring.

During the Frangokratia and Tourkokratia terms of self-description were fluid. For some the only significant identity was that of an Orthodox Christian. Already in the 16th century, however, there are instances of the modern use of "Hellene" with Orthodox Christianity as one of its constituent parts. "Romios" was also used frequently until the War of Independence, and in the areas that remained under Ottoman rule, well beyond. (Modern Turks call Greeks residing in Turkey "Rum"; independent Greece is called "Yunanistan".) Another contender was "Graikos", taken from the Western word. Not until the War of Independence itself was it resolved which would prevail.

In the conscious remoulding of identity that followed the formation of the modern nation state, the choice of "Hellene" reflected Greek, and Western, admiration for the Classical heritage. This encouraged democracy, a high level of education, and competitive achievement, which last has been the most enduring of ancient Hellenic characteristics, rooted as it is in the traditional manner of upbringing. Admiration for Classical Greece also led to an attempt to impose a purified, classicizing language, the katharevousa. This successfully marginalized dialects but ultimately proved unable to resist the "demotic" language, also to some degree a construct, but closer to Greek as it had developed over the centuries.

Two crucial elements of identity, however, were not drawn from antiquity. First, throughout the Romaic period, the Frangokratia, and the Tourkokratia alike, the most fundamental dividing line had been religious rather than linguistic. Some influential Greeks, before and after independence, would have liked to follow current Enlightenment ideals of a linguistically based state. This, however, conflicted with popular attitudes and would have demanded quite as arduous an irredentism as any based on religious allegiance. In practice, Orthodox Christians who spoke Albanian were easily assimilable into the body of modern Hellenes; Muslim speakers of Greek were not. This acceptance of Orthodox Christianity, ranging from the nominal to the fully engaged, remains a more important element of Hellenic identity today than religion in general does in most other European states.

Second, modern Hellenism is a quintessentially political phenomenon, which, until well after Cypriot independence, frowned on the localism central to ancient politics. It drew alike on the western European concept of the nation state; the recollection of united action in antiquity, such as the Persian Wars and Alexander; and the Romaic allegiance to a single supranational empire. Indeed in its first century of independence Athens attempted to reconstitute that empire as a nation state. To this Hieronymous Wolf, the 16th-century German scholar responsible for extending the word "Byzantine" from city to empire (whose subjects had never so used it) made an inadvertent contribution. "Byzantine" history more easily than "Romaic" might be seen as a simple extension of Hellenic antiquity.

Since independence Western influences have flooded into Greece. Despite tensions with individual Western countries, the distaste for the "Franks" has declined over time. There are still, however, points of evident religious and cultural opposition. Events have been less favourable to a diminution of the perception of the Turk as a defining opposite, though human relationships have often been friendly. Positive elements of identity, most obviously close family ties, adherence to the perceived political and cultural essence of ancient Hellenism, and the combination of humane personalist values and rich liturgical life in Orthodoxy, have suffered erosion by modern mass culture, but continue to enjoy wider support than do traditional values in many European countries. For Greeks their history, if continuously reinterpreted, is more important, and more relevant, than for most.

Ignatius, St *c.*AD 30–107

Bishop of Antioch

Ignatius was born in Antioch and was its third bishop (after Peter and Evodius) from around AD 70 until his martyrdom in the Roman Colosseum in the reign of the emperor Trajan (98–117). He therefore belongs to the generation immediately following the Crucifixion. According to tradition, he was converted to Christianity by John the Evangelist and was made bishop by Peter. In fact, we know little about his life before his final journey from Antioch to Rome and martyrdom. In the

4th century, Eusebius (*Historia Ecclesiastica*, 3. 22, 36–38 and 4. 14f.) was unclear about the year of the martyrdom, but is otherwise quite reliable and our chief early source for Ignatius.

Around 107 Ignatius was tried and convicted as a Christian during a local persecution in Antioch – the precise charges are not known. Ten soldiers conducted him to Rome to be fed to wild beasts in the Colosseum. En route, at Smyrna, Ignatius was received with honour by bishop Polycarp and Christians from Ephesus, Magnesia, and Tralles. To these he gave letters thanking their communities for their concern and exhorting them to obey their superiors (bishops or presbyters), who would steer them against the then prevalent Judaizing and Docetic heresies. He also sent ahead a letter to the Christians of Rome urging them not to intervene to prevent his martyrdom, which he earnestly desired.

At Troas he was intercepted by messengers from Antioch who announced that the persecution there had ended. Ignatius wrote two more letters, to the Christians of Philadelphia and Smyrna, again exhorting them to be obedient to their bishop. In the latter he wrote: "Wherever the bishop is, there let the people be, as wherever Jesus Christ is, there is the Catholic Church." This may be the first text that uses the term Catholic Church to mean the body of all Christians. In a last letter to Polycarp, Ignatius asked his friend to support the Antiochene Christians after the recent crisis and to encourage the other churches of Asia to do the same.

A great debate among scholars of the late 19th century settled the question of the authenticity of the epistles. The set of seven accepted epistles written by Ignatius in his last days is usually accompanied by Polycarp's epistle to the Christians of Philippi. The epistles are the principal source for understanding the mind of this martyr, setting forth an orthodoxy that has stood the test of time among Catholic Christians. He was in practice the type of ideal bishop of his epistles.

Ignatius acknowledged the continuity between the Old and New Testaments. Against the Gnostic heresy of Docetism (which taught that Christ was never truly human), Ignatius preached the reality of Jesus' sufferings: "His Birth, Passion and Death were not appearances but realities." He insisted that Christ was both human and divine, did die on the cross for mankind, and is really present in the Eucharist. In discussing the Real Presence, Ignatius was perhaps the first Christian to consider the Eucharist as a *Mysterion* – a Mystery (*Epistle to Tralles*, 2). He is the first writer outside the New Testament to assert the Virgin Birth (*Epistle to Smyrna*, 1. 1) and to describe Christ in the philosophical terms he found in John's gospel: there is only one physician of flesh and spirit, generate and ingenerate, God in man, true life in death, son of Mary, and son of God (*Epistle to Ephesus*, 7). In the face of Docetism and the many other misinterpretations of the Christian faith in his day, from Manichaeism to Arian ideas, Ignatius urged that congregations be guided by a bishop, one trained in orthodoxy and officially appointed as *episkopos* – "overseer" – of his church.

The title of bishop was in use in the eastern Church in the 1st century, though not universally in the west. In Ignatius' century – when all Christians were converts – Antioch had a large Jewish-Christian population but was also the centre of the first and largest gentile Christian congregation. Ignatius thus inherited the effects of Paul's message, which recast Christianity from a sect of Judaism to a religion for all. Teaching and maintaining orthodoxy in such a context was an immense task, requiring strong and clear-headed leadership. Ignatius' work was complicated by the persecutions of Domitian (81–96) and Trajan (98–117) and by the strong presence of Judaizing Christians who still followed the stringent rules and practices of their old religion.

Among the arguments against the authenticity of the letters was their insistence on the importance of the bishop at a time so early in the history of the faith. But in fact, in Asia Minor, Jerusalem, and Syria – the precise places where the epistles place the episcopal office – the episcopacy had existed from apostolic times. And, indeed, Ignatius' use of the word probably applies only to the cities mentioned in the letters, though Irenaeus (*c.*130–*c.*202) compiled a list of the bishops of Rome back to the apostles (*Adversus Haereses*, 3. 3. 3). Ignatius does not seem to have written of the doctrine of apostolic succession.

Ignatius' concern was for a leadership system with undoubted authority in matters of doctrine (*Epistle to Philadelphia*, 4). The bishop and priests represent the Lord and the council of the apostles (*Epistle to Magnesia*, 6. 1). Nothing should be done in church – Eucharist, baptism, even the celebration of the Mass – without approval of the bishop (*Epistle to Smyrna*, 8. 1–2).

Ignatius' teaching is strongly Pauline, that is, it is already addressed to a world Christian community. He urged that good Christians live lives of virtue and service to the community. They imitate Christ in his Passion, and most fully by following him to martyrdom.

The once hotly debated question surrounding Ignatius' martyrdom seems resolved by his *Epistle to the Romans* (1. 2; 2. 1; 4. 1). In it he begs the Christians in Rome not to intercede on his behalf to forestall his martyrdom. This presumes that he had already been condemned to death in Antioch by a Roman official other than the emperor and that the Christians in Rome could indeed appeal to Trajan. Ignatius, however, eagerly wished to imitate his Christ even unto death. Furthermore, his martyrdom in Rome is attested by Polycarp. The church of Philippi, having heard Ignatius during his journey, wrote to Polycarp requesting copies of Ignatius' letters written at Smyrna and Troas. Polycarp complied in the epistle we have, which also recalls Ignatius' martyrdom as a revered memory.

Another controversy arose from Ignatius' words in his *Epistle to the Romans*: did he actually acknowledge the primacy of Rome when he said that he knew he could not command Rome's Christians as did "Peter and Paul who were apostles"? Scholars have concluded that he meant only that he could not give them orders concerning his martyrdom. Nowhere, moreover, does he mention a bishop of Rome.

Thus, in a series of seven not overly long epistles, Ignatius of Antioch touched on many points of doctrine and Church administration. He followed in the footsteps of St Paul in insisting upon a solid organization and a strong basis of authority as requirements for an enduring Christian movement.

Biography

Born in Antioch *c.*AD 30, Ignatius was its third bishop from *c.*70 until his martyrdom in Rome *c.*107. Little is known of his life before his final journey from Antioch to Rome via Smyrna, Troas, and Dyrrhachium. During his last days he wrote a series of epistles to Christian communities which are the main source of his teaching on doctrine and Church administration.

Illyrians

Tribes settled on the northern and eastern shores of the Adriatic

The region where the Illyrians were established is known as Illyria, extending from Epirus in the south to the Danube in the north and as far as the river Morava in the east. The boundaries, however, of the territory of the Illyrians are not clearly defined and little can be learnt from written sources about their origin and culture. Since the Illyrians themselves did not leave any written evidence of their past, information is based on the texts of Greek and Roman authors who referred to these tribes as "barbarian"; the Greeks identified the Illyrians as an *ethnos* (race) different from the Macedonians, Thracians, and themselves. The personal and geographical names appearing in Greek and Latin records and inscriptions contribute to a partial reconstruction of the Illyrian language. It can therefore be deduced that the Illyrians spoke Indo-European dialects. According to a Greek legend, Illyrios was the son of Phoenician Cadmus and Harmonia, who settled in Illyria, and became the ancestor of the Illyrian people. Recent research has demonstrated that the Illyrians comprised a mixture of ethnic groups who did not necessarily have identical origins. Their formation coincides with the beginning of the Iron Age, around 1000 BC.

The Illyrians came in contact with the Greek Aegean at an early date. Excavation finds from the 8th-century BC cemetery at Vergina indicate a temporary Illyrian presence in ancient Macedonia, especially in its northern and western areas. At the same time, Greeks were attracted to Illyrian territory; the silver mines of the region, located inland – e.g. Damastion – increased their interest. Archaeological finds indicate that Greek imported goods, primarily pottery and metalwork, reached the Illyrians who inhabited the Adriatic littoral as early as the 8th and 7th centuries BC. The first Greek cities were established along the Adriatic coast in the late 7th and early 6th centuries BC. By 627 BC a joint expedition from Corinth and Corfu founded the colony at Epidamnus, and around 588 BC another at Apollonia; both became important centres of trade. Thus, the sea crossing to south Italy passed under Greek control and these two ports remained for many centuries the termini of the route across the southern Balkans. Excavations of the early cemeteries of Epidamnus and Apollonia have brought to light numerous examples of Corinthian pottery as well as local Illyrian products. Although Greeks traded in the region north of the river Drin, they did not establish any settlements either on the coast or inland. Three Greek colonies were however founded on the islands of Black Corcyra (Korcula), Issa (Vis), and Pharos (Hvar), by Cnidians, Parians, and Syracusans respectively. The trade which developed between these Greek colonies and the Illyrians contributed significantly to the latter's development and closer contact with Greek culture.

Illyrians made their appearance in Greek affairs in 424 BC. At this time Brasidas and his Spartan army were in Macedonia to assist king Perdiccas and other opponents of Athens to attack the Athenian colonies in Thrace. The Spartans did not at first become involved in Macedon's war with Arrhabaeus, ruler of Lyncus (who was not an ally of Athens but an independent ruler), but following a Macedonian victory they were persuaded to await the arrival of the Illyrian mercenaries who came to join Arrhabaeus. In 423 BC the joint expedition of Macedonians and Spartans ended in retreat because they feared the warlike Illyrians.

The history of the Macedonian kings is marked by a succession of wars against the Illyrian tribes which ended with Roman intervention in the 3rd century BC. The migration of the Celts at the beginning of the 4th century BC disturbed the territory between the Danube and the Adriatic and forced the Illyrians southwards. Consequently, the need for defence united them under Bardylis around 383 BC. The Illyrian attacks on Macedonia brought the latter close to collapse. King Amyntas II and, later, Perdiccas were defeated and the latter was slain (359 BC). It was only in Philip II's reign that the Illyrians were completely crushed and part of their territory was annexed to Macedonia. The Illyrians attacked Macedonia again in Alexander's time, but they were defeated. In the reign of Cassander an Illyrian tribe, the Taulantii, became involved in the struggle between Epirus and Macedonia, offering asylum to the infant Pyrrhus after the expulsion of his father Aeacides from his kingdom among the Molossians. When Pyrrhus became king of Epirus, he strengthened his links with the Illyrian tribes by marriage alliances.

The wars with Macedonia and Epirus brought the Adriatic Illyrians into contact with the Greek world. Major changes in the social and economic life of south Illyria occurred before the end of the 5th century BC, while in the north similar changes

appeared a century later. The urbanization which followed the growth of towns – the first fortifications were built in the 5th century BC at Gajtan – altered the tribal structures and created a demand for greater political autonomy. The first public buildings were not constructed however until around the middle of the 3rd century BC at Byllis.

An Illyrian kingdom was established in the 3rd century BC with its capital at Scodra. The dynasty of the Antigonids in Macedonia was often distracted from its attempt to retain power in Greece by Illyrians, especially the Dardani, on the northern frontier. At the same time, a new power, the Ardiaei, who inhabited the south coast of the Adriatic, emerged among the Illyrians. Responding to the request of Demetrius II of Macedonia, the Ardiaei and their king Agron helped Macedon's allies, the Acarnanians, against the Aetolians in the siege of Medion (231 BC). After Agron's death, the command passed to his widow Teuta and the Illyrians engaged in piracy, ravaging the shores of Greece and Italy. The Greeks turned to Rome for help. The two Illyrian wars with Rome (229 and 219 BC) ended with the submission of the Illyrians and the annexation of part of their territory by the Romans.

Summary

Around 1000 BC the Illyrians settled the territory north and east of the Adriatic known as Illyria, extending from Epirus in the south to the Danube in the north and the Morava in the east. They left no written records. They were in contact with the Greeks from the 8th century BC and were inevitably caught up in wars between Macedonia and Epirus. They had a reputation for piracy which extended beyond the Roman conquest.

Imperial Cult

The imperial cult almost certainly owes at least part of its acceptance during the Roman empire to the establishment of ruler cults in the late Classical and Hellenistic periods. Although a divine cult for a living person was against Greek tradition, the Spartan commander Lysander had received a cult on Samos after the Peloponnesian War. Only scanty evidence exists for other divine cults to individuals in the 4th century BC before the time of Philip II of Macedon and Alexander the Great. Whether Philip received a cult during his lifetime is debated, but his son certainly did: his personality, conquests, and unlimited power had elevated him to an unprecedented status that demanded special recognition.

Alexander's successors not only bolstered his worship, but were often granted their own ruler cults. The reasons for this were largely due to the community's need to acknowledge the rulers and their families as individuals of immense power and wealth who excelled all others in their benefactions; the cults were an assertion of the rulers' unique abilities to aid their communities. Some rulers, such as the Ptolemies at Alexandria, also established their own dynastic cults to celebrate their families, but these cults rarely lasted very long.

The creation of a Hellenistic ruler cult involved the construction of a temple or shrine only occasionally (about a dozen are known). Far more common were awards of an altar, priest, sacrifices, games, and statues. Statues of the ruler might even be placed in existing temples of traditional deities, where the ruler would "share" the space, honours, and even qualities of that deity.

The purpose of these cults is still debated: were they religious or political in nature? To deny one in favour of the other is difficult, because politics and religion were very closely entwined in antiquity. What is certain is that the people who founded and managed the cults were creating a new reality in which the immense power and influence of the rulers, who now directly affected life in the Hellenistic world, were given prominent recognition.

The imperial cult was not merely a simple continuation of the Hellenistic ruler cult but was, nevertheless, partially inspired by it. A divine cult to a living Roman became part of Italian culture only through contact with Greek cities. Marcus Claudius Marcellus, who sacked Syracuse (212/11 BC), and Titus Quinctius Flamininus, the liberator of Greece (196 BC), both received divine honours. Yet the practice became more common only a century later as other individuals, Greeks and Romans, were given cults in recognition of their benefactions to communities.

The almost simultaneous adoption of the cult of Roma (the power of Rome) in Greek cities from the early 2nd century BC reflected another aspect of the growth of Roman influence in the east. Much more widespread than the earlier ruler cults, the cults associated with Rome mirrored the development and spread of Roman power; they represented an acknowledgement of that power by the Greeks.

The preeminence of deified Julius Caesar and his adopted son Octavian/Augustus altered the practice of these cults in the east. Augustus was praised as the greatest of all benefactors and saviours in the east, because of the peace attributed to him after the defeat of Antony and Cleopatra. So great was his reputation that, before the end of his life, divine cults to non-imperial family members were no longer being created. The omnipotence of the emperor had been recognized by the eastern communities.

In addition to the hundreds of municipal and private household cults established to celebrate the emperors and their families, eastern provincial assemblies were also given permission to create cults. Emperors were always careful to avoid official deification at Rome itself during their lifetimes (with the exception of Caligula and Commodus), officially becoming deities only upon their apotheosis after death. In the provinces, however, they permitted their worship in conjunction with Roma, other imperial family members, and, eventually, among the cult of previously deified emperors and among the estab-

lished Olympic pantheon. The practice began in 29 BC, when Octavian had given, at the request of the provinces of Asia and Bithynia, permission for temples to be dedicated to Roma and Divus Julius Caesar at Ephesus and Nicaea, and to Roma and Octavian at Pergamum and Nicomedia. Tiberius, the next emperor, refused a request for his cult from Baetica but granted it to Smyrna where the temple was dedicated to him, Livia (his mother and the wife of Augustus), and the Senate. Emperors did have separate temples to themselves, but they commonly shared the honour with others.

Possession of a provincial cult was so prestigious that cities vied with one another for the honour, which, once given, was advertised in the official title of the city. Grants of these cults were quite rare, making them even more desirable considering the economic and political benefits that accrued to them. The members of the provincial elite who managed the cult also benefited: their status within the community and empire increased. Association with these cults was a statement that they and their families accepted the Roman system and hoped to benefit from it.

Imperial cults could be housed in a variety of types of structures, simple to very grand. Existing buildings, such as stoas and gymnasia, were modified to accommodate the cult; others, such as bath buildings, were constructed with special rooms. Unlike the earlier Hellenistic ruler cults, however, many more elaborate complexes were created for imperial ritual. A Caesareum or Sebasteum, the names sometimes used for these special sanctuaries, had no absolute model but might include a temple, altar, and statues among its other features.

The imperial cult was regarded by some in antiquity merely as a form of flattery (Tacitus, *Annals*, 6. 18). Its religious and political importance to the empire is still debated. The ritual probably did help to bring Greek and Roman together, but whether it created any sense of loyalty or instilled devotion among the inhabitants of the empire is difficult to say. Whether the emperor was regarded as a truly divine being is undeterminable; many of the poor and uneducated may have believed so. Yet, since the imperial cult was rarely imposed by the emperor or his court, most will agree that this indicates a willingness on the part of the Greeks to accept the new conditions that accompanied the control of their lands by Rome. The celebration of the imperial cult was an expression of gratitude for the benefactions received or ones that might come in the future. It does not prove or even indicate any real piety towards the emperor. The establishment of Christianity in the 4th century ended the practice.

Imperialism

Most wars in ancient Greece not fought to gain independence were, as elsewhere, motivated by either the fear or hope of plunder, economic exploitation, or outright annexation. All self-governing Greek states were at all times in some form of military preparedness, if not, as was very frequently the case, actually at war. War, like slavery, which it often facilitated, was so common as rarely to provoke questioning of its morality: whether a Greek was or became free or slave was a quotidian accident of the human condition. The Greeks' love of freedom sprang from a perfervid desire to have complete control over their own destinies, a desire that did not question the right to control the destinies of others; and in confirmation of this, Greek gods of war were deemed far more powerful than any god of peace. As Thucydides makes Athenians inform the Spartans, "it has always been an established rule that the weaker are kept down by the stronger" (1. 76. 2), while Aristotle adds to preservation of one's own liberty and hegemony over one's subjects as legitimate aims of war "the exer-

cising of the role of master over those who deserve to be slaves" (*Politics*, 1334a2). Thus the continual imperialist bullying by even small states of each other is the very warp of the tapestry of Greek history; and any alliances were inexorably doomed to ephemerality or continuous internal dissension.

The earliest form of Greek imperialism was the *synoikismos* (literally "living together") of the Dark Age, the process by which the polis, or city state, emerged; but the extent to which surrounding communities joined the dominant city voluntarily or under coercion is usually unknown: presumably it varied. In most of these city states equal citizenship was enjoyed by all members. Sparta, however, which became by far the largest city state and had by the end of the 8th century BC conquered Laconia and most of Messenia, was governed by an elite group of Dorians who reduced the mass of the inhabitants (the *perioikoi*, literally "those who live in the surrounding area") to second-class status or collectively owned helotry. Although this policy was not unique to the Spartans, the scale on which they applied it necessitated the reorganization of the elite as a permanent standing army for internal protection (the Lycurgan reforms), which in turn excited further, though often unsuccessful, imperialist adventures in the northern Peloponnese, central and northern Greece, Asia Minor, and even Sicily.

Colonization, which occurred chiefly in the period *c.*750–*c.*550 BC, was driven largely through internal pressures rather than imperialist desires, since most colonies were completely self-governing, though retaining religious, cultural, and commercial links with the *metropolis* (mother city). Nevertheless, they were planted, sometimes peaceably and sometimes by force of arms, on the littoral of the Mediterranean from northeastern Spain, southern France, and southern Italy and Sicily to Libya and what is now southern Turkey and on the eastern and southern shores of the Black Sea. They remained essentially Greek, although there was some acculturization of neighbouring peoples, and many had a long history, some in Asia Minor and Pontus enduring until 1922. In the second half of the 6th century BC the settlers in Asia Minor became the first Greeks to experience foreign imperialism when, having survived the harassment of an expansionist Lydia, they succumbed to the Achaemenid Persian empire, which did, however, practise religious tolerance and generally appointed Greeks as satraps under the watchful eye of officials of the Great King. It was mainland Greek help in the uprising of these cities which led to the Persian Wars of 490–479 BC and the subsequent Athenian attempt at hegemony.

The Delian League (a modern term) was formed in 478 BC to defend Greek states against further Persian reprisals, but its leader, Athens, clearly had imperialist ambitions from the beginning when it forcefully coerced Eion to join. Athens' attempt, despite some federalist elements in the city, to establish for its own economic benefit a rival to the Spartan-led Peloponnesian League is clear from actions such as the reduction of Thasos, which attempted to secede in *c.*465–462 BC, the transfer of the treasury from Delos to Athens in 454 and the gradual substitution of monetary "tribute" for supplies of ships, the imposition of a huge indemnity on Samos for defiance in 440 BC, and the killing of all adult male citizens and enslavement of the rest of the island's population when Melos refused to join in 416 BC.

The first half of the 4th century BC was marked by various short-lived imperialist attempts by, for instance, Thebes and, in Thessaly, Jason of Pherae; but it was Philip II of Macedon who,

having first brought his semi-autonomous barons to obedience and established a standing army, successfully extended his rule over all Greek mainland states except Sparta. Panhellenism, a movement to unite all Greeks against Persian threat, which had been preached by men such as the Athenian Isocrates, played a part in his ambition to invade the Persian empire, but his death in 336 BC left its execution to his son Alexander III. Despite some contemporary propaganda and the romantic view of universal brotherhood held by some modern scholars, the megalomaniacal Alexander was activated by an insatiable lust for conquest which was terminated only by his soldiers' refusal to continue and his own subsequent death. He made little attempt to organize the vast swathe of territory which he had overrun, his policy of forcing Macedonian officers to marry Persian women being driven principally by an infatuation with the charms of Persian imperial trappings and the desire to create an elite neither Macedonian nor Persian with loyalties to himself alone. His conquests did, notwithstanding, have the enormous consequence of spreading a veneer of Greek culture over the Near East and establishing a simplified form of the language as the lingua franca (as evidenced in the New Testament), a legacy which survived the area's incorporation into the Roman empire.

Alexander's failure to nominate an heir ensured the immediate fracturing of his empire, which fell into three main successor states: one (Antigonid) mainly in Macedon and Greece; one (Seleucid) stretching from Anatolia to, initially, Central Asia; and one (Ptolemaic) based upon Alexander's eponymous city in Egypt, which, despite its Macedonian rulers, replaced Athens as the principal centre of Greek culture. Greek imperialism was now exercised by individual rulers attempting to expand their personal empires at their rivals' expense. In the 2nd century BC some small breakaway Greek states invited the Romans to aid them resist reabsorption, but the continuing threats from Macedon and the Seleucids and even quarrels among the smaller states themselves induced the Romans eventually to abandon their policing of Greece and embrace it within their own growing empire. Apart from the destruction of Corinth in 146 BC Roman rule in Greek lands was remarkably lenient. The Roman attitude towards their inhabitants was contempt for their moral laxity, fractiousness, and military inferiority mingled with an admiration for their culture so strong that the poet Horace admitted (*Epistles* 2. 1. 156) that the captive held its captor captive, while upper-class Romans communicated with each other in Greek by preference.

It may be argued that Greeks were involved in the creation of the Roman empire, since its first province, Sicily, was created in 241 BC at least in part to facilitate the Romans' protection of the Greek colonies there against Carthaginian attacks. Moreover, the traditional Roman fetial (priestly) prohibition of the "unjust" war was in theory strengthened (though in practice weakened) by the influence of Greek Stoicism after the Rhodian Panaetius (an intimate of Scipio the Younger and the most important political figure in mid-2nd-century BC Rome) rejected the excesses of Stoic exclusivity and made Stoic philosophy amenable to generals and statesmen. Thus any non-civil Roman war became "just", since it potentially brought the benefits of a superior Roman civilization to the benighted nations of the world and legitimized the elimination of any rulers who opposed conquest. In Virgil's memorable words, Rome's mission became "to spare the down-trodden and vanquish the proud" (*Aeneid*, 6. 853). The process of imperial territorial acquisition and human absorption into the state reached its natural conclusion in an edict of Caracalla (the Antonine Constitution), which gave citizenship (although most of its advantages had by then been abolished) to virtually all free members of the empire probably in AD 212.

The Christianization of the Roman empire initially brought about remarkably little change in the empire's mission and the role of its emperor. Rome was still to spread its civilizing influence over the whole world, albeit now in the name of the Christian God rather than the Stoicized Jupiter. The orb representing the world, which some pagan coins had shown Jupiter handing to the emperor or one emperor passing to another, was now surmounted with a cross to indicate Roman dominion of the world on behalf of God, although it probably remained merely an intangible and mainly numismatic symbol rather than an item of imperial regalia. No longer of divine status himself, the emperor yet became God's vicegerent on earth and remained a quasi-divine figure, whose image was haloed, to whom *proskynesis* (various ceremonial gestures of reverence) was due, and against whom rebellion was sacrilege; and he was also expected, as legal documents proclaim, to exhibit towards his subjects *philanthropia* (love of mankind), which had already been demanded by Hellenistic treatises on kingship but was also the all-important characteristic of God himself.

Despite the empire's proselytizing mandate, the self-righteous bellicosity of the Muslims and western Crusaders was largely unknown in Byzantium, since Christianity engendered an abhorrence of war through the teaching of the New Testament (and its patristic interpretation) and the realization that the killing of a foe was still the killing of something in the image of God. In the 4th century St Basil even ruled that soldiers who had killed in battle should be barred from communion for three years, while in the 10th the petition by Nikephoros II Phokas that his slain soldiers should be made martyrs was denied by the patriarch Polyeuktos. Thus, while imperial expansion was welcomed and military heroes were, with some reservations, applauded, praise was bestowed on emperors who fought with a minimum loss of life on either side and, even more, on those who through diplomacy obtained their objectives bloodlessly. Emperors, with frequently the active support of the Church, strove to build a network of alliances especially in the Balkans, the Caucasus, and the buffer region between Christendom and the Caliphate, which Obolensky, for eastern Europe, so aptly calls "the Byzantine Commonwealth". Byzantine methods of controlling this "client empire", and of playing off its members against each other, are detailed in *De Administrando Imperio*, a manual which was compiled, or at least commissioned, by Constantine VII Porphyrogennetos for the use of his son Romanos II, and which has miraculously survived. Nevertheless, many wars were motivated by irredentism, notably by Justinian I in the west and thereafter principally to recover territory lost in the east to the Arabs and the Turks: this, indeed, was the major consideration of Alexios I in initiating the First Crusade.

The theory that the Roman empire was the sole terrestrial empire and coterminous with Christendom was widely held in both east and west until Charlemagne allowed himself to be crowned emperor of the Romans by Pope Leo III on Christmas Day 800, when the Frankish king, denying the legitimacy of a female ruler, believed that the throne in Constantinople, which was held at that time by Irene, was in fact vacant. Thereafter, despite the implication of the forged "Donation of Constantine" that only emperors created by the popes were valid, westerners increasingly believed in the possibility of rival empires, and Byzantines, while arguing against this, compromised their opposition by adding "of the Romans" to the title of their own emperors. Nevertheless, for some centuries yet the Roman empire, with its capital at Constantinople, had a prestige unmatched in the west and rivals wished not so much to destroy the empire as to take it over. Most notable among these were Symeon of Bulgaria in the early 10th century, the Seljuk Turks (who in anticipation of their desired final conquest named their sultanate Rum) in the 11th to 12th, the briefly successful Latins and the unsuccessful Kalojan of Bulgaria in the 13th, and eventually the victorious Ottoman Turks in the 15th.

Thereafter the Greeks' experience of imperialism was always as subjects. After the fall of Constantinople in 1453, most Greek-speaking areas came under Ottoman rule, although some islands held out for a great many years (as, for example, did Tinos until 1715) while others continued or came to be governed by Venice. Venetian rule was relatively benign, although some Orthodox were more offended by Venetian Catholicism than Ottoman Islam. Under the Turks the Greeks, in accordance with the Muslim use of religion as the defining criterion of nationality, were given a degree of internal self-government as a separate *millet* (community) within the Ottoman empire. A few Phanariots, led by Alexander Mavrokordatos in the late 17th century, rose to the rank of Grand Dragoman (Chief Interpreter) and even Exaporite (Minister of Secrets) at the Sublime Porte and were appointed *hospodars* (governors) in Moldavia and Wallachia. However, as central Ottoman control diminished, the vast majority of rural Greeks became increasingly subject to the often capricious whims of local potentates such as the notorious Ali Pasha of Ioannina (1750–1822).

For a short time following the Treaty of Campo Formio in 1797 the Ionian islands became part of the empire of Napoleon Bonaparte, who declared that for him Corfu, Cephalonia, and Zakynthos were more important than the whole of Italy. The islands were swiftly freed from the French, becoming a Russo-Ottoman condominium and by 1800 a Russian protectorate. They reverted to French rule through the Peace of Tilsit in 1807, but were taken by the British in 1814 and in the following year became "a single, free and independent state under the exclusive protection of His Majesty", a fiction that entailed direct rule by a British Lord High Commissioner until 1864. The Greeks' own imperial ambitions were ended shortly after World War I, when *I Megali Idea* ("The Great Idea") of reestablishing the Byzantine empire with its capital at Constantinople was reduced by the decisions of the victorious allies from a genuine hope to an evanescent dream. Their experience of imperial rule was, however, not quite over. Although Mussolini's occupation of Corfu in 1922 was swiftly terminated, in part through a speech at the League of Nations written by one cricketer (C.B. Fry) and delivered by another (K.S. Ranjitsinhji, Jam Sahib of Nawanagar), Cyprus remained under British control. Though technically under Ottoman sovereignty, the island had been administered by Britain since 1878; it was annexed outright on the outbreak of war in 1914 and became a British colony in 1923. The demand for *enosis* (union with Greece), beginning in the 19th century and culminating in the 1950s with the terrorist activities of EOKA (the National Organization of Cypriot Struggle), resulted in independence for the island in 1959. Since then the sole continuing overt remnant of imperialism for Greeks has been British retention as sovereign areas in Cyprus of the 256 square km constituting the military bases of Dekelia and Akrotiri, although Greek complaints of covert imperialism by the United States have had some justification.

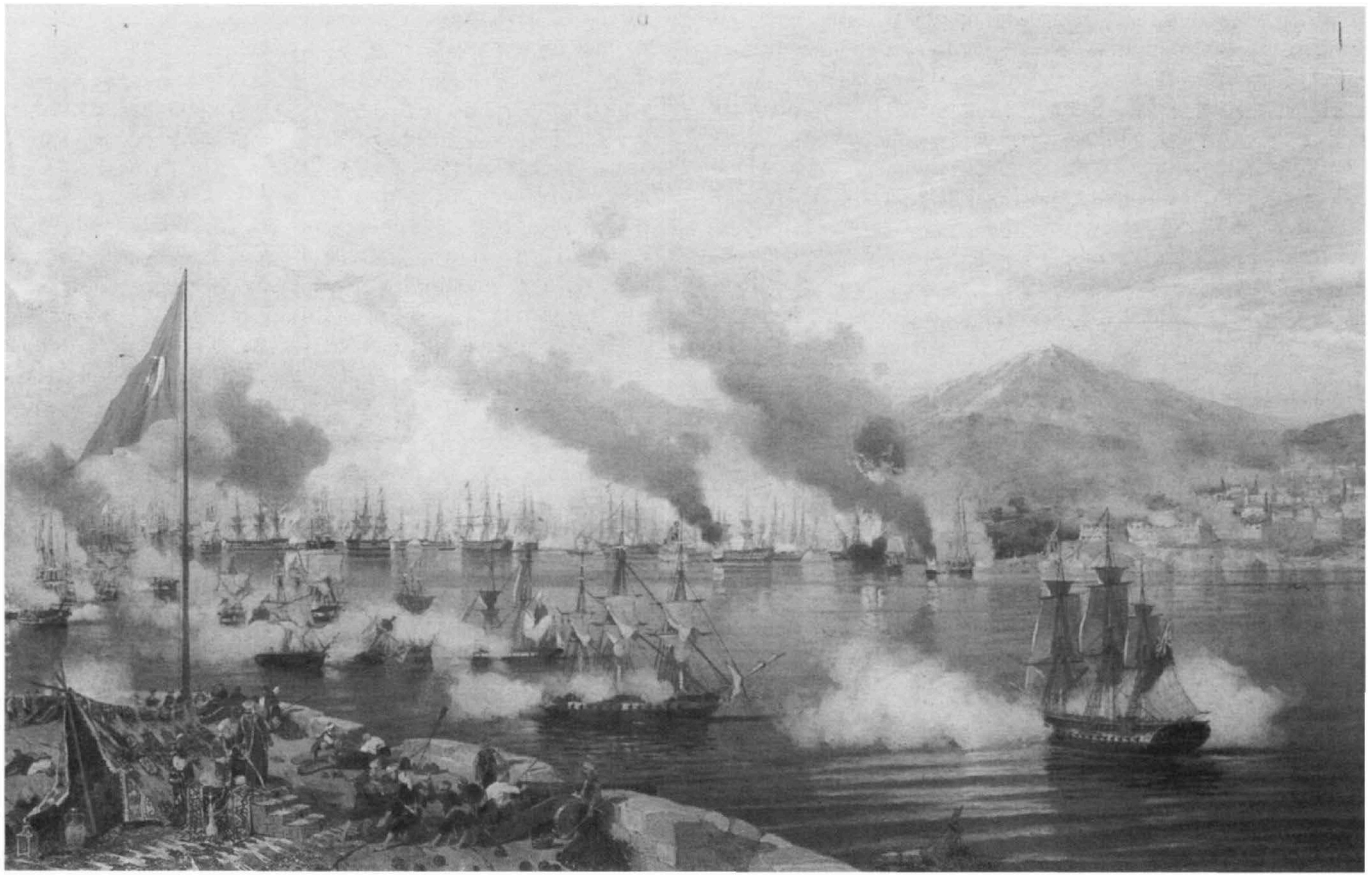
Independence, War of 1821–1832

The Greek revolt from the Ottoman empire and the establishment of an independent kingdom of Greece (1821–32) was the



War of Independence: the Battle of Navarino (1827) as depicted by L. Garneray. The Turkish fleet was annihilated in the action and the outcome of the war was finally assured. Hellenic Maritime Museum

first successful challenge to the concert of the "Great Powers" (Britain, Russia, Austria, Prussia, and, after 1818, France, where the Bourbon monarchy was restored after Napoleon's defeat and sought to preserve the status quo in Europe). Differences among the allies had already surfaced before 1821, with Austria, Prussia, and Russia contending that the alliance should suppress revolutions and maintain absolute monarchy, while Britain viewed it as a means to deter further French aggression. Thus Britain opposed intervention in Spain where the Bourbon king Ferdinand VII faced revolt from rebels who insisted that he respect the constitution. Similarly, Britain refused any joint move to restore the king of Naples and Sicily, Ferdinand I, who had broken his promise to respect constitutional reforms when he was restored to his throne in 1815. Nevertheless, in 1821 an Austrian army with Russian backing reinstated Ferdinand I, and the next year a French army restored absolute monarchy in Spain. Thus the Greek revolt was a challenge to the prevailing ideology of European diplomacy after the Napoleonic Wars, while at the same time it opened the delicate "Eastern Question" caused by the Ottoman empire's decline and its waning control of its outlying regions.

Since the fall of Constantinople in 1453, the Greeks had lived under the rule of the Turkish sultan, and what is now modern Greece was a province of an empire with its capital at Constantinople. Turkish rule was arbitrary and treated Christians as inferiors; taxes, although collected by local Greek leaders, were oppressive, and the government could not maintain law and order: the klephts (brigands) from their mountain bases practised banditry as a hereditary profession, and some of these klephts such as Theodore Kolokotronis in the Peloponnese, Markos Botsaris in Epirus, and Odysseus Androutsos in central Greece were to become prominent in the revolution. However, the Greeks were permitted their language and their Greek Orthodox faith, and a remarkable degree of cultural continuity persisted both with the Byzantine empire and, among the educated, with the Classical past. Greeks prospered in trade and in the Ottoman administration, and the three cities in the empire with the largest Greek populations were Bucharest, Smyrna, and Constantinople, where the Greek Orthodox patriarch had his seat, and the Greeks of the Phanar (the Greek quarter) were among the sultan's most trusted counsellors. Greek merchant communities were to be found in most of the trading centres of Europe, particularly London, Paris, Geneva, Moscow, and Odessa, and a Russo-Turkish convention of 1783 gave the Greeks the right to trade under the Russian flag. Much of the Greek national revival before the War of Independence took place outside the boundaries of modern Greece.

French and Russian interest in Greece antedated the French Revolution: Catherine the Great played briefly with the idea of reestablishing the Byzantine empire with Constantinople as its capital and her grandson Constantine as emperor, and on the eve of the Revolution, in 1788, France established a consul at Ioannina which had developed into a Greek cultural centre under Ali Pasha, the *veli* (governor) of Epirus who ruled his

pashalik with only nominal recognition of Ottoman suzerainty. English aristocrats began to include Greece in their Grand Tour, particularly after the Napoleonic Wars closed Germany and Italy to them, and in 1809 Greece had a famous visitor, Lord Byron, who was already writing the first cantos of *Childe Harold's Pilgrimage*, which was to bring him an international reputation when it was published (1812). In 1814 the British inadvertently gave a strong stimulus to revolution by taking the Ionian islands from Napoleon and making them a protectorate, and in the same year three merchants at Odessa founded the *Philiki Hetaireia* (Friendly Society) which aimed boldly at rebellion.

The rebellion of Ali Pasha in 1820 presented the *Hetaireia* with an opportunity, for it drew off Turkish forces, and the Hetairist conspirators planned a revolt in Greece to coincide with an incursion of Greek expatriates across the Pruth river into Ottoman Wallachia (modern Romania) led by a Phanariot Greek, prince Alexander Hypsilantes, who had been a Russian army officer and aide-de-camp to tsar Alexander I. Hypsilantes advanced on 6 March 1821, but his invasion failed, the tsar disowned him, and he fled to Vienna where he died in exile. But on 25 March Germanos, the metropolitan of Patras, whom a suspicious governor had summoned to Tripolitsa (modern Tripolis) along with other clergy and primates, raised the standard of the cross in the monastery of Hagia Lavra. There followed a general uprising all over Greece, and a massacre of the Turks living in the Peloponnese.

The sultan reacted by hanging the Greek Patriarch Gregory V in Constantinople on Easter Sunday and various other prominent Greeks, and the Greek populations in Constantinople and Smyrna were decimated. On 5 October Tripolitsa in the Peloponnese fell to the Greeks led by Kolokotronis and thousands of Turks were killed or taken as slaves, while early in 1822 the Turks riposted with a massacre of the Greek population on the island of Chios. In July a large Ottoman army led by Mohammed Dramali pushed south through the pass of Thermopylae, took Corinth, and reached Argos where it encountered strong resistance, and when Dramali, running short of supplies, tried to retreat, his army was caught and destroyed (6 August) by Kolokotronis in the Dervenaki pass, which the Turks had neglected to secure. The year 1822 established Greece as an independent state; it began with the proclamation of a constitution with Alexander Mavrokordatos as president, and by the end of the year the Turks had surrendered Nauplia to Kolokotronis, and had withdrawn from all of eastern Greece south of Thermopylae. However Kolokotronis, who now was in control of the Peloponnese, refused to hand over Nauplia to the constitutional government, which had to accept protection from the shipping magnates on Hydra and Spetsai, one of whom, George Kountouriotis, a Hydriot shipowner of Albanian descent, was elected president. But 1823 was still a successful year: the Turkish offensive, hampered by the destruction by fire of the sultan's arsenal in Constantinople, failed in Epirus where Markos Botsaris, the Greek "Leonidas", defeated a Turkish force at Karpenisi, but was killed in the moment of victory, while in the east Kolokotronis abandoned his feud with the national government long enough to crush a new Turkish thrust against the Peloponnese. But sultan Mahmoud by no means accepted defeat, though circumstances now forced him to turn to the pasha of Egypt for help.

The cause of Greek freedom attracted widespread support in Europe, and a diverse collection of volunteers flocked to Greece: French, Germans, Italians, and Danes, some of them former soldiers in the Napoleonic War, all of them ill informed about local conditions. The first philhellene battalion was almost annihilated in July 1822 at the Battle of Peta near Arta in northwest Greece, and the remnant filtered homewards, disillusioned. A "German Legion" of 120 German and Swiss volunteers recruited by a Greek adventurer, "Baron" Kephalas, landed at Nauplia in 1823, where it was abandoned without supplies, and dispersed. But at the end of the year a group of british Philhellenes arrived in Missolonghi, and they were joined by the most famous philhellene of all, Lord Byron.

Byron, who reached Missolonghi on 5 January 1824 and died on 19 April, was connected with no important victory, but he sparked an enthusiasm for the cause of Greece that served it better than a military success. Byron had been invited by the London Greek Committee to go to Greece as one of three commissioners to administer a loan which was raised in Britain, and after much hesitation he acquiesced. His attempts to get the various Greek factions to cooperate with each other failed, and he had achieved little when he died from the combined effects of malaria and the attentions of his doctors. His death, however, created a deep impression, not all of it favourable. The obituary in *The Times* read "That noblest of enterprises, the deliverance of Greece, employed the whole of Lord Byron's latter days ... It was a cause worthy of a poet and a hero." But the reaction of the British establishment was more correctly expressed by another notice published in *John Bull*, which said that be had died "at a most unfortunate period of his career, and in a most unsatisfactory manner". The factions within Greece reverted to civil war after his death; Kolokotronis was imprisoned and other notables such as Mavrokordatos and Petrobey Mavromichalis, the semifeudal lord of the Mani, retired in disgust. Yet Byron's death awoke the sympathies of Europe and promoted mightily the climate of opinion that demanded liberty for Greece. His statue, beneath which is buried his heart, was erected in 1881 in the "Park of the Heroes" in modern Missolonghi with, on one side, the tomb of Markos Botsaris who died just before before Byron's arrival, and on the other, a tomb for unnamed defenders of Missolonghi.

The London Greek Committee had been formed in 1823, and by the end of the year had 85 members, many of them supporters of political reform in Britain. The committee's success at raising money by voluntary subscription was not impressive, but it was responsible for the Greek loans, the first of which, with a nominal value of 800,000 pounds sterling, discounted at 41 per cent, was floated on the London Stock Exchange in February 1824, followed by a second loan a year later. These loans, exported to Greece as English gold sovereigns and Spanish silver dollars, helped support the authority of the Kountouriotis government, for Kountouriotis was the only Greek included among the three commissioners appointed by the London Greek Committee to administer them, and in order to get a share of the money, Kolokotronis gave up control of Nauplia at last in early summer 1824. But the money soon disappeared to settle the accounts of the Greek

shipowners who supplied the fleet, pay political debts, settle the civil wars, and satisfy the avarice of the Greek leaders. Little was done to prepare Greece for the next assault by Mehemet Ali, the pasha of Egypt, who had built up a modern army and fleet trained by former Bonapartist officers. He was the nominal vassal of the sultan, and it was to him that the sultan turned for help against the rebellious Greeks.

In February 1825 an Arab force led by Mehemet Ali's son Ibrahim landed in Greece, laid siege to the fortress of Navarino, and defeated a Greek attempt to relieve it. Then, while Ibrahim devastated the Peloponnese, an Ottoman army launched an offensive in the north. April 1826 brought Missolonghi's long agony to an end, and like the massacre at Chios, its fall was commemorated by a painting by Eugène Delacroix (1799–1863), showing Greece expiring in the ruins of Missolonghi. The Turks followed up the capture by securing most of Roumeli (the region north of the Corinthian gulf) and advancing on Athens. By winter 1826 free Greece had run out of both money and food, and in June of the next year the Acropolis of Athens fell to the Turks.

Deliverance came from outside. In 1825 tsar Alexander I indicated that he would welcome a move from Britain, and in early 1826 the Duke of Wellington went to St Petersburg to sign an Anglo-Russian protocol, one clause of which pledged that neither party would seek any increase in territory, exclusive influence, or commercial advantage for itself. France joined later in the summer; Austria and Prussia remained aloof. The Turks, however, refused mediation and Greece's survival was not assured until the battle of Navarino on 20 October 1827, where combined British, Russian, and French naval squadrons destroyed the Turkish and Egyptian fleets. Even so, Ibrahim did not quit the Peloponnese until the next year, when the French government, with the consent of its allies, landed a force which saw to his withdrawal. But the "Powers" were little disposed to enlarge the new state's territory and a new Russo-Turkish war (April 1828–September 1829) distracted their attention. Meanwhile, a National Assembly of Greece met at Troezen and, passing over the various protagonists of the revolution, on 14 April 1827 chose Count Kapodistria, a Corfiote by birth who had served Tsar Alexander I, as *kyvernitis* (governor) for seven years. Kapodistria attempted both to consolidate his own position, hoping to thwart prince Leopold of Saxe-Coburg, to whom the "Powers" offered the crown in 1830, and to increase the Greek domain: efforts to take Chios and Crete failed, but north of the Corinthian Gulf Missolonghi was taken and Athens blockaded, and the last victory of the war took place between Thebes and Levadia in September 1829. But the authoritarian government of Kapodistria roused resentment, which came to a head in the Mani, where the family of Petrobey Mavromichalis held hereditary dominion. On 9 October 1831 one of Petrobey's sons assassinated Kapodistria in Nauplia as he was on his way to church. Greece slipped into civil war again while the "Powers" turned their attention elsewhere, Russia to a Polish insurrection and Britain and France to the creation of Belgium, whose first king was Leopold of Saxe-Coburg, who had abandoned his ambitions in Greece. On 13 February 1832 the Greek throne was offered to the 17-year-old Otto, second son of the king of Bavaria.

Greece had lapsed into anarchy. To quote George Finlay, whose account of the revolution in his history of Greece from the Roman conquest to AD 1864 was based on personal experience, "the whole substance of the land was devoured by hosts of soldiers, sailors, captains, generals, policemen, government officials, tax-gatherers, secretaries and political adventurers, all living idly at the public expense, while the agricultural population was perishing from starvation." The famine year of 1827 would have claimed thousands more victims except for shipments of food and clothing organized by three American philhellenes, George Jarvis, Jonathan Miller, and Samuel Howe, who managed, with some difficulty, to see to it that most of their relief consignments did not fall into the hands of the various Greek factions that were struggling for power. However, on 21 July 1832 sultan Mahmoud signed a treaty recognizing the kingdom of Greece, with its northern frontier a line from the Gulf of Arta to the Gulf of Volos, and the "Powers" guaranteed a loan for the new government. In January of the next year French troops in Argos suppressed a rebellion by Kolokotronis' faction, and when Otto arrived at Nauplia on 1 February with 3500 Bavarian troops, order had already been restored. To quote Finlay again, "The king landed and mounted his horse under the cyclopean walls of Tiryns, which were covered with spectators...Enthusiasts, who thought of the poetic glories of Homer's Greece, and the historic greatness of the Greece of Thucydides, might be pardoned if they indulged a hope that a third Greece was emerging into life, which would again occupy a brilliant position in the world's annals."

Industry

The early phase of industrialization in Greece can be dated to the 1860s. The first wave of bourgeois social and political activity emerged in the 1860s and 1870s, in a context marked by the prevalence of a liberal party and the establishment in 1875 of parliamentary rule. The 1900s heralded the second wave of bourgeois activity, marked by the 1909 coup and the development of several civil groupings and associations. A short-lived attempt in the direction of an industrial policy was the tariff system introduced in 1917, which for the first time represented a systematic effort to assist domestic industry. But industrial policy remained for the most part patchy and incoherent, the result of an extensive but weak state apparatus being unable to steer through social pressures in order to form a policy line on the desired path of development. In fact, the issue of protectionism was a key issue behind the establishment of an association representing industrial interests. Until the Commercial Association of Athens (ESA) was established in 1902, Greek capitalists involved in manufacturing and other industrial production had no separate association. Although its activities and major concerns shifted in the course of its development, the ESA was established first and foremost as an organizational response on the part of major Athens-based commercial interests to the emerging trade union movement and the spread of strike activity and, more generally, the "new awareness of the social question" after 1900 (Hadziiossif, 1997, p. 15). Several industrialists joined the new organization, although most also expressed an interest in the establishment of a separate industrial association. In 1906 the ESA took a line against tariff protection. Against this background it became increasingly apparent that a separate organization promoting industrial interests was needed. In 1907 the industrialists established their own association, the Federation of Greek Industrialists (SEV), which soon proved an energetic forum.

Between the 1860s and the 1910s a number of new industrial establishments were founded, but the overall growth in industrial activity was very small. Still, the beginning of the century was a turning point for the development of bourgeois and petty bourgeois activity in general. As a share of the national product, combined commercial and industrial activities in the widest sense (including various forms of very small-scale production) amounted to approximately 24 per cent in 1870 and 38 per cent in 1910.

The process of industrialization began in earnest in the 1920s. Industrial development was given a boost in 1922 with the influx of approximately 1.5 million Greek refugees from Asia Minor, following Greece's defeat by the Turks. The year 1922 marked the end of a period during which Greek politics and state policy had been almost completely dominated by irredentist impulses. After the 1920s policy priorities changed, although political developments surrounding the end of the Second Republic (1924–35), combined with the international climate, resulted in unimpressive industrial growth. Although the structure of Greek industry and its patterns of ownership and control changed during these interwar years many elements survived well into the 1960s, affecting the country's profile of industry. The predominance of light consumer goods industries and a relatively low own- to total-capital ratio, indicating companies' large debts, continued to be an important feature. The predominance of very small firms (those employing less than 50 persons) also persisted, with fewer than 1 per cent of manufacturing establishments employing more than 50 persons in 1958. Industry acquired a considerable regional concentration, particularly in Attica and, to a much lesser degree, around Thessalonica and in Volos. The average yearly rate of growth in fixed and variable assets of Greece's industrial enterprises from 1957 to 1960 was approximately 5 per cent. At the same time, in the 1960s the number of new factories rose steadily.

Another continuity with the interwar years was a reluctance to separate ownership and management. The dual role of industrialists as owners and managers of their firms, even as some of these firms grew in size and diversified, was a feature of Greek industry well into the 1960s. Management tended to be highly centralized, and preoccupation with the "commercial" aspects of the enterprises appeared to be more immediately rewarding as well as prone to centralized managerial handling than did measures to improve organizational efficiency. Even as the larger Greek companies evolved, some of their more autocratic features persisted in different forms. The predominance of a small inner circle became a characteristic of large Greek companies, particularly with the adoption early on of the French corporate type of the *société anonyme* (SA). Unlike its US or British counterpart, which is usually characterized by widely dispersed shareholdings, the standard SA has a small core of powerful shareholders and a board which is dominated by the company president or director general.

In the immediate postwar period the state's minimal participation in industrial investments was matched by a system of Marshall Aid allocation which reinforced the lack of coherent industrial policy. Apart from testifying to the structural weaknesses of the Greek state, this tendency echoed the views held by a major strand in the dominant US view regarding the desired development goals of the European semiperiphery. A major aid target was the preservation of social stability. The latter was dependent upon the preservation of the existing political structures and the characteristics of the economic system, and it was intended that an emphasis on specialized agriculture for the world market should become the target for Greek development. Instead of strengthening its industrial base, Greece was expected to specialize in small-scale rural enterprises for processing and marketing labour-intensive crops. The proposition suggested a specific position and clear limits for the country's development within the international division of labour (see Lavdas, 1997). When the Greek government produced a Four Year Plan within the framework of the Marshall Plan in 1948, it soon became clear that funds that were originally earmarked for economic aid were transferred to defence, while economic aid funds originally intended for industrial projects went to agriculture (Kofas, 1990, p.73). To some extent the suggested path derived from a general framework of priorities established in the US-dominated world economy and supported by the Organization for European Economic Cooperation (OEEC). In that framework Greece was expected to specialize in agriculture and light (consumer-goods) industries. In the 1950s, while the first priority of the communist-bloc economic union, Comecon,

was the creation of sectors of heavy (producer-goods) industry even in states like Albania, driving ad absurdum the logic of forced industrialization, "the contemporary round of OEEC long-term plans — for plans for dollar viability in 1952–53 were a condition of Marshall Aid — were in revealing contrast: Norway and Greece were rebuked for wanting steel plans" (Kaser, 1965, p.19).

The integration of Greece's industries in the international market was promoted in 1953 with a number of measures which included the liberalization of the tariff system, the devaluation of the drachma, and the adoption of a policy which was explicitly aimed at attracting foreign direct investment. The emphasis on exporting goods, which became the dominant strategy in the late 1950s, went through a series of ups and downs, particularly when it was realized that a strategy relying on agricultural exports would be untenable. The export crisis of 1958–59 manifested the limits of a policy oriented towards agricultural exports and became the background against which the decision was taken to join the EEC as an associate member. From 1960 to the early 1970s the construction boom and foreign direct investments contributed to remarkable growth rates. But from the first (1973) to the second oil shock (1979) the Greek economy lost many of its dynamic characteristics and domestic as well as foreign private investment began to decline. By the time of Greece's accession to the EC as a full member in 1981, Greek industry was in the midst of a period of decline, only worsened by the early policies of the socialist PASOK government of Andreas Papandreou in 1981–85. In 1985 a rigorous but short-lived stabilization effort was undertaken, but the process of relative deindustrialization was only temporarily halted.

On balance, the postwar industrialization process has shown signs of weakening and even reversal since the first oil shock. In contrast to developments in most other countries in the OECD (Organization for Economic Cooperation and Development, which replaced the OEEC in 1961), following the first oil shock profit rates in Greek manufacturing were very slow to reach pre-oil-shock levels. There has been an apparent failure of the manufacturing sector to adjust to international trade and the relaxation of protection and, particularly after the second oil shock in 1979, manufacturing has responded in a defensive manner by retreating to traditional activities such as food and beverages, textiles and clothing (Giannitsis, 1985 and 1993). This has been due to a number of factors, including difficulties in adjusting to rising labour costs following the change of regime in 1974, and the inability to improve productivity (as well as the relatively small margins allowed for a solution that would alleviate the profit squeeze with higher prices), which have led to a deteriorating profit rate since the mid-1970s. In turn, falling profit rates have led firms to rely increasingly on external finance.

In part, the underlying cause of the problem is associated, on the one hand, with the low levels of investment in manufacturing and, on the other hand, with the persistence of the orientation and the structure of production. In the 1950s Greek manufacturing investment per person employed was particularly low in comparison with other European countries. Despite a very high growth rate of manufacturing investment in the 1960s and the 1970s (much higher than the EEC average), manufacturing investment failed to catch up by the mid-1970s, and in the years before EC accession Greek manufacturing investment per person employed was 59 per cent of the EC average. In the late 1980s Greece continued to present a weak industrial gross value-added (the value added to raw materials by production), being at the bottom of the European league with Luxembourg and Ireland (followed by Portugal and Denmark).

The predominance of small firms has persisted. In 1980 more than 70 per cent of the manufacturing labour force was employed in establishments with fewer than 100 persons. The familiar problems of small-scale production are present in the Greek case, although there are also some good sectoral results. While Greek industrial companies (as distinct from their shipping counterparts) have never made it into the top 100 businesses of Europe, industrial small businesses have often been included among the world's top 100 based on a combination of criteria ranging from profitability to foreign market penetration to management efficiency – more recently companies from high technology, construction, and canning (see, for example, *Forbes* magazine, 8 November 1993).

Greece's accession to the European Community in 1981 completed the process of integration in the European economy and at the same time helped to bring into focus various issues of economic policy which had, for the most part, remained vaguely defined or intensely politicized. The Association Agreement of 1961 had reinforced the export-oriented strategy through a new institutional channel, which helped depoliticize and gradually dismantle the remaining areas of protectionism while also focusing on the problems and potential of industrial, not just agricultural, products. However, it must also be remembered that already by the mid-1950s the issue of import-substituting industrialization was dead, and had never been a consistent state policy. Tariff and non-tariff protectionism had been patchy, and no evidence has been found to support the view that economic policy was systematically promoting infant industry. Traditional sectors which were more weighty in political terms were often better protected, albeit with inconsistencies, while modern, capital-intensive, and technologically advanced industries were not granted protection (see Mitsos, 1989).

Despite oscillations, the general trend since the mid-1980s suggests an increase in profitability, raising expectations for increased investment activity. On the other hand, the growth rates of manufacturing production have remained low. Furthermore, import penetration of the Greek market by EU industrial products has grown. Technology flows appear to be declining, indicating the difficulties of Greek industry in absorbing and exploiting technology transfer in production; at the same time, there is an increasing reinforcement of domestic research and development (R&D) activities and higher participation rates of private firms in R&D (Giannitsis, 1993, p. 237). An overall assessment of the impact of EU membership on Greek industry can only be undertaken in a comprehensive context that would take account of the following factors: the effects on political stability; the implications for vertical integration within Greek industry; the creation of collaborative R&D schemes and the effects on domestic technological development as distinct from technology flows; changes in the relationships between public enterprises and the private sector; and the establishment of a level playing field

through the implementation of European competition policy combined with the EU-induced development of national competition authorities.

Inheritance

The transfer of property upon the death of the owner is known as inheritance, and almost every country has special laws that regulate the disposition of private property after the owner's death by naming the relatives or other persons who have first rights of inheritance. It is also permitted to transfer property to persons other than those specified by law by means of a will (the legal instrument that embodies the owner's ability to dispose freely of his or her property posthumously), and rules for making such wills are also set by inheritance law. The person who inherits or who is entitled by law to inherit property after the death of its owner is known as an heir, while the dead owner is called the decedent. Upon the death of a person, the title to all the property, both personal and real, must pass to someone. If there is a valid will, property usually passes to the legatees, i.e. the persons directed by the decedent. In the absence of a valid will, the decedent is said to have died intestate, and the law must then decide who the valid heirs are, and the order and proportion by which they inherit. This is done according to statutes known as intestacy laws. Strictly speaking, an heir is a recipient of money or property left by someone who died intestate, whereas the beneficiary of a will is technically known as a legatee or devisee. But in common usage "heir" refers to anyone awarded an estate, whether or not the deceased person left a will.

In ancient Greece, where our evidence comes chiefly from Athens and the Cretan city of Gortyn, intestate succession was favoured. Wills, which were normally written and witnessed, were allowed only when the testator had no sons. First in order of succession came the dead person's sons and male descendants. Thus, if a deceased man left legitimate sons, they shared the property equally, the eldest getting no more than the others. The western medieval right of primogeniture – according to which land devolved automatically on the eldest legitimate son – had no place in Greek society. If a son died before his father and left sons of his own, then those sons inherited their father's share. If there were no sons or male descendants, the inheritance passed to the decedent's brothers and male descendants, and in the third place to the sons of the decedent's grandfather and their male descendants. Ascendants were excluded if their descendants were alive: the father did not inherit if a brother of the deceased was alive; nor did the grandfather, if an uncle was alive. No distinction was made between natural and adopted sons; but children born out of wedlock were illegitimate, and had no claim on the father's estate. During the Byzantine period, however, all

natural persons (i.e. blood descendents, including slaves, minors, and the unborn) could inherit, as also could corporate bodies, communities, the Church, or pious foundations. Christianity, in fact, encouraged donations at death to churches and monasteries as well as the distribution of part of the inheritance among the poor. Moreover, under Byzantine rulers, the state demanded part of the inheritance in the form of voluntary grants or as a mandatory obligation. However, the right of individuals to inherit was diminished or even precluded by a set of punishable offences and other factors: heretics, apostates, and even children of a mixed marriage with a heretic were excluded from succession while manumitted slaves might receive only the so-called *legata* (special legacies). There were also restrictions regarding the inheritance of certain specific types of property: *stratiotika ktemata* (military goods), for example, could be inherited only by those capable of fulfilling military service (perhaps a similar objective was achieved by the Homeric heroes through prizes given at funeral games, cf. *Iliad*, 23). Although slaves could inherit under the Byzantine empire, they were not given the right to transfer property upon death. However, wills of women and monks are known and *paroikoi* (tenants) were entitled to transfer their lands to heirs, though probably only with the approval of their lords.

In Classical Athens the claims of sons and male descendants could not be set aside by testamentary dispositions. Males generally excluded females in the same group of kinship. Only in the absence of sons or male descendants of predeceased sons could a daughter inherit. She was obliged to marry the man to whom her father had destined her either when he was alive or by a will. Failing such disposition, the daughter could be claimed by the next collateral together with her father's fortune. But if a son remained, the daughter had no right to succeed and could demand only a dowry, to be determined at the discretion of her brother. If she was divorced or was childless after marriage, the dowry went back to the heirs, i.e. the male descendants. If the decedent left a daughter but no son, and if the daughter had a son, he would inherit. But as long as she was without a son, she was *epikleros*, i.e. a sort of "heiress", who could be claimed in marriage by her nearest male relative who took charge of the property until their son was old enough to take it over. One must not, however, conclude from this that women in Greek cities could not inherit. Literary and epigraphical sources, from Athens, Gortyn, Naupactus, and Thermus in Aetolia, of the 5th–3rd centuries BC, suggest that women did inherit, in a succession order of varying complexity in different states. In the absence of legitimate children, the inheritance could be claimed by relatives within the *anchisteia* (close kin). It was in effect possible for a man without sons to choose an heir by adoption and thus ensure the continuance of his family and the religious worship connected with it. The adoptee became legally the son of the adopter and so inherited the property, but could not oust an *epikleros*; he might marry her himself (in which case the chief share of the inheritance would fall to this married daughter and her husband, while any other daughters would be given dowries), but anyway her son inherited eventually. If a son had not been adopted, and there were only daughters surviving, the succession passed to them. In such a case the next of kin had a legal right to one of the heiresses, and could claim to marry her even if she had married someone else before receiving the inheritance. On the other hand, poor heiresses had a legal claim on their nearest of kin either for marriage or for a provision suitable to their circumstance. A man who married an heiress was bound by custom and tradition, if he had sons, to name one as heir to the property that had come with his wife, and thus to restore the house.

According to tradition, it was Solon (*c.*640–560 BC) who introduced wills to Attic law. Previously, the estate of a childless man had gone to his clan. Because it gave one the power to dispose of property after death, the right to make a will was a recognition of the right of private property rather than of family, clan, or tribal ownership. We have surviving accounts of the wills of some well-known personages of antiquity. Aristotle was generous in providing for his family and friends, while Epicurus willed his property to the school hoping "that all those who study philosophy may never be in want ... so far as our power to prevent it may extend" (Diogenes Laertius, 10). According to his first speech *Against Aphobus* (no. 27), Demosthenes' father left in trust for him an estate worth about 14 talents, including two small businesses in cutlery and furniture. The Athenian banker Pasion in his will appointed his former slave Phormio as guardian for his younger son, entrusting him with the management of the bank until the boy should come of age; he also stipulated that Phormio should marry his widow (Demosthenes, 36). Some of the purposes of a will had been achieved by resorting to adoptions, which continued to be common and were treated to some extent like wills. But the will took effect only on the testator's death. No formality was needed for legitimate sons to take possession of the inheritance, and they had no right to refuse it. Other relatives, however, needed an official authorization. If a man died intestate, leaving neither descendants nor adopted sons, the inheritance fell to his nearest relations in the male line and, in default of these, to those in the female line as far as children of first cousins. It was also possible to resort to posthumous adoption by which relatives arranged for one of themselves to become legally the deceased man's son. Disinheriting, however, was possible only in the father's lifetime by solemn declaration. It was not possible to disinherit legitimate children by means of a will or adoption.

At Athens anyone who thought that he had a legal claim to an inheritance made an application to the archon to hand it over to him. This application was displayed in public and read out in the following assembly. The question was then asked whether anyone disputed the claim or raised a counterclaim. If not, the archon assigned the inheritance to the claimant; otherwise the matter was decided by a lawsuit. Even an inheritance once assigned might be disputed in the lifetime of the holder and for five years after his death. The same procedure was followed regarding the claim of the nearest relation to an heiress. The Athenian orator/speech-writer Isaeus (*c.*420–*c.*350 BC) appears to have specialized in cases of inheritance. Of some 50 speeches with which he was credited, the 11 that have survived in entirety all deal with cases of inheritance and are important as illustrations of Athenian testamentary law.

According to the Gortyn law code (12 columns of laws engraved on the interior wall of a former courthouse and attributed to the 5th century BC), the property was shared by

the sons and daughters, but a son got twice as much as a daughter, as happens de jure among the Muslims (cf. Qur'an 4: 2 and 34). A daughter without brothers was called *patroiochos* and her rights were generally similar to those of the *epikleros* at Athens, although there were differences of detail.

Both forms of transferring property – through a will and through intestate succession – were recognized in the Byzantine empire. It was also possible to enter into an informal agreement when a dowry was promised for a marriage contract, so that these agreements assume the character of both marriage and inheritance contracts. By the time of the code of Justinian (AD 529), Roman law recognized many types of wills, including oral wills declared in the presence of seven witnesses or before a public official. But for the Byzantines, the will represented only one of many dispositions that a living person could make in view of his death. On the one hand, for a will to be valid, it was not necessary for an heir to have been appointed and, on the other hand, it was possible to make *legata*, *fideicommissa* (bequests in trust), donations in view of death, to pious foundations, distributions of money for the good of the soul (*psychika*), and similar arrangements independently without being part of a formal will.

The heir entered into the legal position of the deceased and therefore became responsible for the obligations of the testator just as he, in his turn, could put forward the claims of the testator. The heir was also considered a debtor of the legacies bequeathed by the testator. To keep the heir's own property from being liable for the debts of the deceased, it became the practice from the time of Justinian I to establish an inventory documenting the size of the inheritance. A limitation on the responsibility of the heir for paying the bequests made by the testator was guaranteed by the Falcidian Law of 40 BC.

Inscriptions

Inscriptions can be taken to refer to objects made of different materials – e.g. pottery, clay tablets, metal, and most usually stone – on which letters have been carved, drawn, or painted. The study of inscriptions (epigraphy) usually focuses on inscribed stone or metal objects. In this article some mention will be made of inscriptions on pottery, clay tablets, and coins, but the focus will be on stone and metal inscriptions.

Inscriptions provide the cultural historian of the Hellenic tradition with a wealth of ideas and information about the past and the ways in which the people of the past presented themselves. Inscriptions are more familiar to the historians of the Graeco-Roman world, but inscribed material from the Byzantine, Frankish, and Ottoman eras is also known.

Some students of history still make the mistake of thinking that epigraphic evidence has a greater value than other forms of evidence because of its often more durable nature. Inscriptions, like much historical evidence, have been produced in a temporal and spatial context often with a self-conscious appreciation of meaning and function. The evidence of inscriptions is therefore laden with difficulties of interpretation, in addition to the fact that not all the material that was inscribed has survived or been discovered. Further, not all areas of Greece or Greek communities inscribed; nor did all Greek communities inscribe all the time. These phenomena can be summarized by the term "epigraphic habit". Of all ancient societies, the Greeks were among the most advanced in terms of their epigraphic habit; and of the Greeks, the Athenians provide the most extreme example of display through inscriptions. Greek inscriptions are one index of the diffusion of Greek culture, and their distribution reaches far beyond the shores of the Mediterranean: Greek inscriptions and organized modern collections of ancient material appear in Bulgaria, Romania, and southern Russia; a large body of evidence exists in the Near East, along the African coast, particularly in Egypt and Cyrene. Greek inscriptions appear all over the Graeco-Roman world, thereby illustrating the importance of the Greek language for the development of Western culture.

But in many communities inscriptions were made not only in the Greek alphabet. From some periods and some regions a combination of languages have survived on some inscriptions. The Letoön trilingual is an inscription which provides a parallel text in Aramaic, Greek, and Lycian (Davies, 1983, pp 244–45). In many areas during the Roman period, bilingual Greek–Latin inscriptions were made, the *Res Gestae* of Augustus being perhaps the best-known example (Brunt and Moore, 1967). From the Classical and Hellenistic periods, numerous bilingual inscriptions in Greek and Phoenician have survived, especially on Delos, on Cyprus, and at Athens.

Greek inscriptions first appeared in the Archaic period; the earliest known examples are scratched or painted on pottery and date to the second half of the 8th century BC. Their appearance touches on the related question of the introduction of the Greek alphabet. Modern understanding of the introduction and development of the Greek alphabet is heavily dependent on inscriptions. Of the inscriptions which survive from the archaic period, many examples exhibit a significant difference both in regional dialects and in local letter styles (Jeffrey, 1961).

Although very few of the early inscriptions amount to lengthy texts, the majority are dedications, brief commemorative statements, often in a funerary context. An inscribed bronze helmet dedicated by the Syracusans to Zeus at Olympia is an offering made from the spoils of a victory over the Etruscans by Hieron after a battle at Cumae (Fornara, 1977, no. 64A). According to Diodorus Siculus (11. 51), the successful naval battle was fought in 474 BC. The first lengthy inscriptions survive from the 6th century BC. Among the best known are the legal texts from Crete and in particular the great code from Gortyn which gives vital details about the organization of the Dorian community (Fornara, 1977, no. 88).

By the 5th century BC many areas of the Greek-speaking world were producing inscriptions, often of some length. Athens was the leading producer, exploiting the high-quality marble of the Penteli and Hymettus mountains on which to inscribe decrees. The so-called Athenian tribute lists record the offerings (1/60 of the tribute payment) made to Athena by members of the Delian League. The lists were set up on the Acropolis in Athens and are the largest and probably the most studied series of documents from the 5th century. They provide a lengthy and detailed, if incomplete, list of the payments made by the individual cities who were subject allies of Athens from the middle of the 5th century to the last years of the Peloponnesian War (see Nixon and Price, 1990). In contrast to Athens, its main rival, Sparta, does not offer any detailed epigraphic record for the Classical period. Stone inscriptions were not produced in Sparta in any real quantity until the end of the Hellenistic period.

Inscriptions have many uses in exploring the past. They provide highly specific information, sometimes giving very accurate dates. Ancient chronology is complicated by different regional and civic dating systems. The Parian Marble lists historical events from the early history of Greece down to the 3rd century BC but is riddled with inconsistencies and confusions (Fornara ,1977, no. 1; Harding, 1985, no. 1; Austin, 1981, no. 1). The vast number of inscriptions from Athens provides a well-established body of carefully dated material. The day, month, and year, and the sitting public officials are given in the prescripts of most decrees of the Athenian people.

Inscriptions also offer a huge range of names and form the basis of the study of names (onomastics) and of named individuals (proposopography). The *Lexicon of Greek Personal Names* has collected all known instances of names from different regions of Greece; inscriptions provide the majority of the known evidence.

Inscriptions can also give particularly useful details about events and periods of history. Epigraphic evidence is often the only contemporary documentary information which survives for certain periods of history. The Athenians formed an alliance in 378/7 BC with Thebes and other Greek cities; the founding agreement of the alliance has survived on stone but its existence is omitted, notoriously, from Xenophon's account of this period of 4th-century Greek history (Cargill, 1981; Harding, 1985, no. 35).

Other areas of cultural and social history are illuminated by the evidence of inscriptions. There has been considerable controversy over the extent to which the ancient Greeks practised exposure of infants. Pomeroy (1983) has argued on the basis of an inscription from late 3rd-century Miletus that selective female infanticide may have been practised among the families of mercenaries. Inscriptions supply enormous amounts of information and details about religious practices in antiquity. Sacred laws were inscribed on stone, as were calendars of religious festivals, dedications to deities, the financial accounts of cults, and decisions of cultic organizations.

The skill and dedication of those who study inscriptions have yielded valuable results. Different regions of the Greek world produced distinctive letter forms. In some areas there are sufficiently large numbers of inscriptions for experts to identify different "hands" of those who inscribed stones. S.V. Tracy has elevated the study and identification of the letter-cutters to such a high degree that many Athenian inscriptions of the 4th to the 1st centuries BC can be dated on the basis of the syle of the carved letters alone (Tracy, 1990, 1995).

Inscriptions were erected by a variety of authorities in antiquity. The state decrees are the most useful source of information for historical events, often concerned with major events or individuals who played some role in them. The most common form of public decree records the community as a whole honouring an individual. Such honorific decrees can be very formulaic in their phrasing and award of thanks. Crowns of olive, ivy, oak, or gold, property ownership rights, seats in the theatre, public acclamation, statues, citizenship rights for an invididual or his family and descendants, and of course erected inscriptions were all different ways in which people were honoured. Many of the honorific decrees from the 4th century onwards reveal important historical details: from Athens in the 270s the decree honouring Callias of Sphettus has revolutionized knowledge of the poorly documented first half of the 3rd century (Shear, 1978).

Public decrees also present important details about the political organization of communities. A collection of Greek public decrees made by Peter Rhodes allows such comparisions to be made among the epigraphically active Greek communities (Rhodes and Lewis, 1997). In the post-Classical period there was a massive increase in the number of communities producing inscriptions, particularly in Asia Minor. The political ideology of a community is often transmitted in its decrees. Decrees were passed by the public assembly, or council, or subgroup of the community (e.g. deme, tribe, etc.). While it is exceptional that fairly detailed descriptions of the Athenian and Spartan constitutions are available from literary sources, the political structures of other Greek communities can sometimes be reconstructed only through the study of inscriptions.

Honorific decrees typically account for the achievements of the honorand, especially from the mid-4th century onwards. But a number of inscriptions self-consciously reframe past events for a contemporary audience. The Themistocles decree from Troezen (Fornara, 1977, no. 55) was inscribed in the 3rd century and provides details of the career of the Athenian general who laid the foundations for the 5th-century empire and commanded the Greek forces against the Persians in 480 BC. From Cyrene a 4th-century inscription erected in the temple of Apollo seems to contain the text of the oath of the settlers who had originally founded the city (Fornara, 1977, no. 18). The founders had travelled from Thera, and established the settlement on the Libyan coast which flourished under the Battiad dynasty in the archaic and early classical periods. The 4th-century text allowed people from Thera to

claim property and rights in Cyrene on the basis of the terms of the original 7th-century agreement of the settlers which is here reinscribed. Both the Themistocles decree and the Cyrene inscription illustrate how inscriptions can contain unique documents which not only shed light on history, but also represent how history was shaped for subsequent generations in ancient Greece.

However, it is a mistake to think of inscriptions as simple archives of information. Certainly, decrees and laws served as extensions of a city's authority and legislation. Public records were kept in many Greek cities or temples, but often on perishable materials. The proportion of inscriptions written up on stone was always very small, but did at least represent an authoritative voice in a city's affairs. By the 3rd century BC collections of such decrees were being made, indicating that a far greater awareness of the information that the inscriptions contained was developing: Craterus (*c.*321–255 BC) published nine volumes of Athenian decrees.

But public decrees are only a small proportion of published inscriptions. A vast array of groups and individuals had inscriptions set up, e.g. groups of soldiers, demes, associations, religious organizations, ambassadors, kings, mothers, fathers, husbands, wives, widows, and children. The largest single type of inscription is the funerary monument; a rough estimate would suggest that of the known inscriptions from Athens between 400 BC and AD 267 perhaps as many as 70 per cent are funerary.

The epigraphic habit of the Greeks was passed down to the Romans. Greek communities continued to inscribe throughout the period of the Roman empire and beyond. The numbers of the later inscriptions are much smaller and their study is less well established than for the Graeco-Roman periods. Inscriptions from the Byzantine period exist but are fewer and the material has not been studied thoroughly: funerary inscriptions are less elaborate and details of donors and benefactors appear painted on pictures.

The Frankish and Ottoman domination of the Greek world imposed different authorities. Few inscriptions survive from this period, and the epigraphic habit virtually died out. However, the study of inscriptions developed in the Middle Ages. Cyriacus of Ancona (1391–*c.*1455) visited Greece in the 1430s and 1450s and on both occasions recorded inscriptions. The Italian scholars of the Renaissance promoted epigraphy as a subject of value, and although their work concentrated on Italian material, it promoted an interest in inscriptions and enabled the future explosion of interest in Greek epigraphy. Numerous travellers to Greece continued to record inscriptions. In the 17th century, Jacob Spon and George Wheeler recorded texts; the stones themselves became desirable objects. Thomas Arundel collected ancient marbles, including both sculpture and inscriptions. His most famous inscription was the Parian Marble, a catalogue of dates and events drawn up and inscribed in 264/63 BC. The increasing popularity of the Grand Tour in the 18th century ensured that more travellers from western Europe reached Greece. Antony Askew, an English doctor and amateur philologist, recorded over 200 inscriptions at Athens in 1747. The intensifying interest in Greek culture in the late 18th and early 19th centuries resulted in the removal of many antiquities from Greece, most notoriously the Parthenon marbles. Inscriptions were among the stones removed from Greece, and in the early 19th century the study of epigraphic material reached new heights with the publication by A. Boeckh of the first volume of the *Corpus Inscriptionum Graecarum* (1828).

Inscriptions have become an easily identifiable feature of ancient culture. They offer a remarkable insight into the life and history of the people of antiquity. The legacy of ancient Greek inscriptions for Western culture is quite remarkable: one has only to visit any major 19th-century European cemetery to find imitations of inscribed gravestones from classical Greece. But it is the study of inscriptions and the appreciation of their importance in reaching an understanding of Greek culture that have progressed most rapidly in the last 200 years.

Instruments, Musical

Musical instruments, many of them borrowed from or shared with neighbouring cultures, have featured prominently in Greek music-making since antiquity. Whether played solo or in ensembles, they have been employed at various times in history for recreation, to accompany songs and dances, and to enhance religious and civic ceremonial. Certain instruments and ensembles have tended to be characteristic of the musical cultures of particular geographic regions or historical periods, with others relegated to special functions or particular classes of people. In both ancient and modern Greece, for example, reedless pipes (*syringes* and *floyeres*) have been associated with shepherds, while rams' horns (*kerata*) and conches have been used as signalling devices.

Since very few specimens have survived even partially intact, scholars studying pre-modern Greek instruments rely heavily on the testimony of literature and art. The number of ancient literary references to instruments is vast and ranges from practical observations to discourses by Plato and Aristotle on their proper role in society. These are all predated by the representations of instruments in Cycladic statuettes of the 3rd millennium BC. Minoan, Mycenaean, and Cypriot art of the 2nd millennium BC depicts the use of lyres, harps, pipes, and other instruments in both cultic and domestic circumstances. For the organology of the Archaic and Classical periods, the many detailed representations of instruments and their players on painted pottery are particularly valuable resources. Much later, illuminated manuscripts and church frescos preserve important information regarding the instruments of the Byzantine and post-Byzantine periods.

Ancient Greek music was dominated by lyres and the wind instruments known as *auloi*. Hellenic lyres, unlike those of their neighbours, were always constructed symmetrically with a soundbox at the base and a pair of arms supporting a crossbar at the top. Suspended between the soundbox and the crossbar were strings of equal length. These were normally made of gut or sinew, passed over a bridge on the soundbox, and tuned at the crossbar by means of thongs or pegs. The instruments were played either by plucking the strings with the left hand or by striking them with a plectrum held in the right hand. Although variants on this basic design appear in ancient literature with overlapping appellations, Greek lyres may conveniently be grouped according to the shape of their soundboxes into box lyres and bowl lyres. Seven- or eight-string specimens of the louder and structurally more complex wooden box lyres, which featured a larger soundbox extending to the arms, appear in Minoan and Mycenaean art. Scholars have identified the smaller and simpler models with a reduced number of strings that appear in later geometric art with the *phorminx* of Homeric epic. With the emergence in the 7th century BC of the *kithara*, a lyre used by professionals in competitions, more elaborate versions again began to be depicted. Timotheos and other innovators of the 5th century BC subsequently extended the harmonic capabilities of the kithara through the addition of up to five additional strings. In addition to a standard square-based concert model, several variants have been identified, including a rectangular "Italiote" kithara and a smaller "cradle" kithara normally played by women. Unlike these kitharas, bowl lyres (such as the *barbitoi*) had a small rounded soundbox made from a tortoise shell or wood covered by hide, and thin arms in the shape of horns, from which they were occasionally fashioned. Small models were employed by amateurs and in education, whereas the larger and therefore deeper *barbitos* was associated with the lyric poetry of Sappho and Alcaeus, as well as with scenes of revelry.

Despite its common mistranslation as a "flute", the aulos was actually a cylindrical reed instrument with finger holes. Early models seem to have featured 3 to 5 holes, while later concert instruments are recorded as possessing up to 24. Although auloi with a single reed like the modern clarinet were probably not unknown, most were fitted with a double reed, thus making them akin to oboes and shawms (e.g. the modern Greek *zournas*). Some players wore a leather strap (*phorbeia*) around their head to support both their cheeks and their instruments, the latter of which came in various sizes and were usually played in pairs. Most artistic representations of paired auloi, the earliest of which is a Cycladic figurine in white marble of the mid-3rd millennium BC (now in the National Archaeological Museum, Athens), show instruments of equal length. Since most ancient art depicts the player's hands in approximately the same position, it is likely that unison playing and heterophony were the norm. Nevertheless, the occasional use of drones and bursts of simple polyphony may be inferred from scattered literary references. Some of these passages, however, may refer specifically to the less common "Phrygian" auloi of unequal length, the larger of which is represented in art with an upturned bell. Credited with the ability to arouse strong emotions, auloi were used publicly in religious rituals, drama, and dance, and domestically at banquets and symposia.

The ancient Greeks employed a variety of other instruments in addition to lyres and auloi, the number of which increased in Hellenistic and Roman times. Harps (e.g. the *trigonon*, *pektis*, and *magadis*) were usually played by women in private during the Classical period, after which larger concert models evolved. Lutes appeared in Cyprus as early as *c.*1400–1200 BC, but it was not until the 3rd century BC that the three-stringed *pandoura* appeared on the Greek mainland. Other instruments that were adopted from the east in later centuries included the bagpipes and the *psalterion*, a form of zither. The *syrinx* (panpipes), as has already been mentioned, was generally considered a pastoral instrument, as was the later transverse flute (*syrinx monokalamos* or *photinx*). Rattles (e.g. the *seistron*, borrowed from Egypt), cymbals (*kymbala*), clappers (*krotala*), drums (*tympana*), and other percussion instruments were used for apotropaic purposes, for rhythmic accompaniment, or as toys. Early brass instruments such as the trumpet (*salpinx*) were used mainly for signalling, for example to sound the attack in battle or to issue a call to worship. During the Roman period, however, fanfares played by military bands of

brass and percussion instruments became a fixture of state ceremonial and remained so until the end of the Byzantine empire.

Also rising to prominence only after the classical era was the *hydraulis*, a hydrostatic organ invented during the 3rd century BC by the Alexandrian engineer Ctesibius. According to Hero, the *hydraulis* supplied a steady flow of pressurized air to its pipes with a piston that expelled water from a chamber (*pnigeus*) lying at the bottom of a sealed cistern. Initially this invention appears to have attracted little attention, but a Delphic inscription of 90 BC records the prize-winning participation of an organist in a competition. Sometime around the 2nd century AD the mechanically complex piston was replaced by bellows, which could be used with or without a cistern. By late Antiquity large organs with multiple ranks had become common in amphitheatres and other public venues, while smaller instruments often graced banquets. The *Book of Ceremonies* of Constantine VII Porphyrogennetos (913–59) and the accounts of foreign visitors to Constantinople testify to the continued use of organs by the imperial court even after the radical contraction of urban life suffered by the Byzantine empire during the 7th and 8th centuries. Tenth-century processions featured portable instruments, and several decorated models were used within the Great Palace alongside such automata as a golden tree with whistling birds. Organs were also sent as gifts to Carolingian rulers, thereby contributing to the revival of the instrument in the West.

The extraordinary continuity with late antiquity observable in the use of certain ceremonial instruments at the Byzantine court was not representative of Hellenic music as a whole, the culture of which had undergone major changes following the advent of Christianity. These partially reflected a puritan reaction to instrumental music that had been building ever since Plato stated that the aulos and other "polyharmonic" instruments should be banned from an ideal state. Continued by pagan thinkers from Aristotle to Lucian, this critique was redoubled by Clement, St John Chrysostom, and other Fathers of the Christian Church who identified musical instruments with the sexual immorality they saw in pagan theatre, banquets, and religion. Vehement criticism was backed up by canonical legislation prohibiting the playing of instruments by clergy and making the baptism of aulos and kithara players dependent on the renunciation of their trade. While these two instruments disappeared along with the theatre of ancient Greece, other string, wind, and percussion instruments continued to be employed in Byzantium for recreation, as domestic entertainment, or to accompany dances. By the 10th century the Hellenic string instrumentarium had undergone significant development and, like contemporary Arab music, had come to include five-stringed bowed fiddles (*lyrai*) as well as psalteries and lutes (*pandourai*). The Orthodox Church, on the other hand, admitted only a very limited number of percussion instruments. Whereas the early monks of the Egyptian desert sounded trumpets to mark the hours of prayer, the Byzantines announced the beginning of services with the striking of wooden planks or metal bands known as *semantra*. After the Latin conquest of Constantinople in 1204, belfries were installed in many Byzantine churches as the practice of bell-ringing was borrowed from the West, only to cease later in areas that fell under Ottoman occupation. Today the ringing of bells coexists in Greek monasteries with the sounding of small portable and larger stationary semantra, all of which are struck with distinctive rhythms. The only other exceptions to the Church's prohibition of instruments are the small bells affixed to some incense burners and vestments.

Modern Greek folk and popular music employs a heterogeneous body of instruments, many of which have been adapted from or are held in common with the musical cultures of such neighbouring peoples as the Turks, the Arabs, the Slavs, and the Italians. These may be divided into melodic instruments, which play melodies alone or heterophonically in groups, and accompanying instruments, which provide rhythmic or harmonic accompaniment. The identity of the instruments fulfilling these roles has, like the folk-song repertories with which they are associated, traditionally varied from region to region. The leading melodic instrument of Thrace, Crete, and other islands has historically been a pear-shaped bowed fiddle known as the *lyra*, while the Greeks of Pontus and Cappadocia have played bottle-shaped variants (the *kementzes* and *kemanes*, respectively) of this instrument. Their leading role is fulfilled elsewhere by shawms including the *pipiza* and *karamouza* of Rumeli and the Peloponnese, as well as the larger *zournas* of Epirus and Macedonia. All of these double-reed instruments have typically been accompanied by the beating of a cylindrical drum (*daouli*). Native fiddles and shawms, however, have been gradually displaced by western orchestral counterparts, namely the violin, which appeared as early as the 17th century, and the clarinet. The latter was rapidly accepted during the first half of the 20th century alongside such traditional wind instruments as end-blown flutes – e.g. the *souravli* and the shepherd's *floyera*, the side-blown flute and panpipes having died out among the Greeks after the fall of Byzantium – and two types of bagpipes: the mainland *gaida*, with a single chanter and a drone; and the *tsabouna* of the islands, which lacks a drone but features two chanters. Lutes, which may exercise either a melodic or accompanying function depending on the variety of instrument and the musical repertory, remain a mainstay of the Greek instrumentarium. They include the long-necked *taboura* and *sazi*, the Italianate mandolins of the Ionian islands, and the *bouzouki* and smaller *baglamas* popularized by *rebetika* (songs of the urban underclass). Primarily used for accompaniment are the large pear-shaped *laouto* and the *outi* (i.e. the Arabic *'ud*, which was rarely encountered in mainland Greece before the Asia Minor disaster of 1922). In more recent years traditional lutes have been supplemented or replaced by the western guitar and the hybrid *laouto-kitharo*. Three zithers are also encountered in an accompanying role: the plucked *kanonaki* (a descendant of the Byzantine psalterion and Arabic *kanun*), the *santouri* (a trapeziform dulcimer), and its larger cousin the *tsimbalo*.

Urbanization, the relocation of the Greeks of Asia Minor, westernization, and the rise of the mass media have all contributed to the formation of hybrid song repertories in which the regional variations of Hellenic folk music have been rendered progressively meaningless. The instrumentation of popular repertories initially tended to vary markedly by genre (e.g. an Ionian *mantolinata* – mandolin orchestra – for early Athenian song and a bouzouki-led ensemble for *rebetika*). Over the course of the 20th century, however, the spread of western triadic harmonies to nearly all Greek repertories has

displaced many traditional instruments. After World War II such syncretism became fully conscious in Greek popular music, the composers of which deliberately placed bouzoukia alongside western orchestral and modern electronic instruments.

Ioannina

City in Epirus

Located on the western slopes of Mount Pambotis in the centre of Epirus (the northwesternmost district of Greece), the city of Ioannina has over its long history come under the control of a number of different cultural influences. The site on which Ioannina now stands has been invaded by Alexander the Great, by Byzantines, Romans, Normans, Venetians, Serbs, Turks, Albanians, and, finally, in 1913, by Greeks, who joined Epirus to the modern Greek state in the course of the Balkan Wars. Despite these many external influences, Ioannina has throughout its history been known as a centre of Hellenism.

Much about the city's origins is hotly debated – even its name is of uncertain provenance. Numerous historians (Leake, Hatzedakes, Aravantinos) argue that the name "Ioannina" is taken from the monastery of John the Baptist; others claim that the city was first named after an unidentified Slav called Ioannes; others still that Ioannina was the name of the daughter of one of Justinian I's most valued soldiers.

While it is unclear exactly when the site was established as a city, the historical record indicates that the area has had a sizeable population since the time of Alexander the Great (d. 323 BC). The province of Epirus, of which Ioannina is now capital, was under Roman rule from 168 BC to AD 375. The settlement's growth and establishment as a city of significant proportions was effected under Byzantine rule, which began in AD 375 and continued (with interruptions) until 1430.

Ecclesiastical documents show that Ioannina by the 7th century was important enough to be established as bishopric of the Byzantine Church; this was effected under the metropolitan of Naupactus in AD 674. As Rae Dalven has noted (p. 3), "The presence of a bishop of Ioannina indicates that Ioannina already had a fortress and a permanent population." The Second Council of Nicaea (787) made reference to Ioannina as a city. Such references suggest that already by the 6th century it is appropriate to refer to Ioannina as an area of significant urban concentration.

In 1082 Ioannina was taken from the Byzantines by the Norman Bohemund, but Norman possession of the city was short-lived, and by 1083 Ioannina was back in Byzantine hands. In 1185 the Normans again captured Ioannina, this time virtually destroying it in the process. Ioannina's next period of growth came after the sack of Constantinople during the Fourth Crusade (1204), following which Epirus became a Venetian territory. When in 1210 the Venetians turned Epirus over to the control of Michael Komnenos Doukas, a Venetian vassal, the result was the creation of the so-called "despotate of Epirus", which, Venetian connections notwithstanding, was functionally an independent Greek principality. At the end of the 13th century the despotate of Epirus was once again joined to the Byzantine imperium. It remained under Byzantine control for the next century and a half, until 9 October 1430, when the people of Ioannina peaceably surrendered to the Ottomans.

The period of Ottoman rule of Ioannina was, from a political standpoint, less turbulent than preceding eras in the city's history. Whereas early eras saw numerous invasions, Turkish possession of Ioannina continued uninterrupted for almost 500

Ioannina: view of the city from the island in the lake. The minaret belongs to the mosque of Aslan Pasha which is now a museum of folk art

years. The arrival of Ottoman control did not translate as a diminution of Hellenic cultural norms in Ioannina. If anything, the reverse was the case. If in Anatolia the Ottoman presence led to the gradual dilution of the late-medieval markers of Hellenism (Orthodox Christianity, Greek literary tradition, etc.), in the case of Ioannina the political elite to some extent gradually became assimilated to the dominant Greek cultural forms. Whereas in Anatolia many Greeks converted to Islam and came increasingly to use the Turkish rather than the Greek language, in Ioannina Greek was not just the official language of the Orthodox Church, but it came to be the language of the ruling elite too.

This adoption of Greek for official purposes had a powerful effect on the development of the modern Greek language. Ali Pasha, the Ottoman-appointed Albanian who governed Ioannina during the late 18th and early 19th centuries, used demotic Greek as his official courtly language, and knew very little Ottoman Turkish. The Greek language in Ioannina was thus propagated not just by the Church establishment (which during the Tourkokratia was in most areas the single most important transmitter of the Hellenic linguistic heritage), but also by the state itself.

During the period of Turkish rule Ioannina came to be one of the most important cultural and economic centres of the Greek world. On the trade route linking the port of Salaora (Arta's port) in the west to Thessalonica in the east, Ioannina was the staging post for the exportation of an array of goods. It also had a sizeable trading community of its own, the vast majority of which was made up of Greeks and Hellenized Vlachs. During the 18th and 19th centuries these Greek traders established far-flung links to the Greek diaspora, particularly in the Italian city states, northern Europe, and Russia. As a result of these trade ties, Ioannina was during the later centuries of the Turkish period a very cosmopolitan and wealthy city. The wealth was reflected in a range of arenas, first and foremost of which was Ioannina's renowned educational establishment, which came increasingly to serve as the training ground for the Ottoman pashas' courtiers.

Finally, Ioannina holds a significant place in the history of a very important, although often neglected, strand of Hellenism. Ioannina, until the time of World War II, was a major centre of Greek Judaism. Whereas the sizeable Jewish populations of other Ottoman Greek cultural centres (Thessalonica, for example, or Constantinople) were largely the result of the resettlement of the Sephardim following the persecutions of Spanish and Sicilian Jews at the end of the 15th century, scholars believe that a Romaniote Jewish community had been established in Ioannina as early as the 9th century AD.

Ioannina was an important Jewish as well as Orthodox educational centre during the Tourkokratia. Unlike the

Orthodox community, however, the Jews experienced an increased level of persecution following the Greek War of Independence, and the 19th-century record tells of outbursts of lethal anti-Semitic violence in 1851, 1869, and 1872.

In the early 19th century Ioannina was a centre for Zionism, and with the establishment in the city of the Alliance Israelite Universelle (1904) and the Amale Zion ("Working for Zion", 1905), the city's Jewish community began actively to cultivate economic, intellectual, and religious contacts with the outside world. Virtually half the city's Jewish population emigrated during the next decade, most to the United States. By the mid-1940s some 2000 Jews still lived in Ioannina. Fewer than 200 survived the war – a handful by hiding in the mountains. Only 100 survived Birkenau and Auschwitz. With the destruction of Ioannina's long-flourishing Jewish community, a vital component of Hellenism was effectively extinguished.

Summary

Now the capital of the province of Epirus, Ioannina has been occupied at least since the 4th century BC. It largely followed the political fortunes of Epirus, with a long period of stability and prosperity beginning with the onset of Ottoman rule in 1430, but has always been an important centre of Hellenism. It also had a flourishing Jewish community until World War II.

Ionian Islands

Islands off the west coast of mainland Greece

The seven Ionian islands, Corfu, Cephalonia, Zakynthos, Leucas, Ithaca, Cythera, and Paxos, are often referred to as Heptanesus ("seven islands"). They do not, however, form a geographical unit. Even the epithet "Ionian" is of obscure origin, probably stemming from Ionian settlers in ancient times. The political unity of the seven islands is, by contrast, comparatively recent, dating from the establishment of the Septinsular Republic (1800–07).

The first attempt to merge the islands into one political unit was made in the 9th century, when they were formed into a distinct province, the Thema Cephallenia. Although the Ionian islands formed part of the eastern Roman empire ever since its formation, Byzantium's sovereignty over them was frequently challenged. Their exposed offshore geostrategic position made them vulnerable to repeated invasions and conquests. The Normans, led by Robert Guiscard, captured Corfu and Cephalonia in 1081; and the islands were again engulfed by war during the prolonged struggle between Byzantium and western Crusaders in the 12th century. With the establishment of the Latin empire in 1204, the Venetians took possession of Corfu and established their largely uninterrupted predominance in the region. To expedite the process of colonization Venetian aristocratic families were granted fiefdoms on the island. Soon Venice conquered Cephalonia, Zakynthos, and Leucas, and they became tributary to the Venetian republic. The rule of La Serenissima was challenged by corsairs and by Greek and Neapolitan claimants at intervals throughout the later 13th century. By 1386 Corfu had voluntarily submitted to Venetian rule, a move which reflected Venice's rise to the position of leading maritime power in the Mediterranean. In 1485 Venice purchased Zakynthos from the Ottomans, and captured the depopulated island of Cephalonia from them in 1499. Leucas was frequently occupied by Venice but was not finally taken until 1684. Cythera was brought under the republic's control as late as 1717.

The Ionian islands' Venetian period was marked by the payment of heavy tributes which the new rulers exacted from the islanders. Venetian rule rested mainly on the loyalty to the republic of the principal native Ionian families, their adherence being rewarded by the ample bestowal of titles, privileges, and appointments. Venetian political control was cemented by the cultural predominance of this maritime power. The Italian and Greek elements of the population were largely assimilated by intermarriage; the Catholic Church was established; and Greek ceased to be the predominant language, though it was still spoken by the rural population, which also continued to adhere to the Orthodox Church.

With the fall of the Venetian republic in 1797, Venetian rule over the islands came to an end. By the Treaty of Campo Formio, Austria acquired Venice proper, and the Ionian islands were occupied by France, though by the end of the following year, 1798–79, a joint Russo-Turkish expeditionary force had evicted the French occupying troops. By the Russo-Turkish treaty of 1800 the islands became the independent Septinsular Republic. Seven turbulent years followed. There was no internal political stability, and chaos and anarchy prevailed.

In 1807 Russia abrogated its barely concealed protectorate over the islands and, in a secret clause of the Treaty of Tilsit of that year, the islands were ceded to France and recognized as an integral part of the French empire. Now part of the province of Illyria, the Ionian islands remained French territory until the collapse of Napoleonic rule in 1814, though Zakynthos, Cephalonia, Cythera, and Leucas were taken by British forces under General Oswald in 1809–10. Corfu was surrendered to the British in 1814 following the abdication of Napoleon Bonaparte.

In the Treaty of Paris of 1815 the Concert of Europe placed the "United States of the Ionian Islands" under British protection, with Austria enjoying equal commercial rights, an arrangement that had been strongly approved by the Russian foreign minister, the Corfiot Count Ioannis Kapodistria. Although the Treaty of Paris had decreed the Ionian islands to be a "sole free and independent state", its stipulations were not devoid of ambiguities and were certainly open to different interpretations. The islands' constitution of 1817 placed their administration in the hands of a six-man senate controlled by a legislative assembly of 40 members. Real power, however, lay

with the British High Commissioner. The first Lord High Commissioner of the Ionian islands, a former governor of Malta, Sir Thomas ("King Tom") Maitland (1815–23), purposefully exploited the ambiguous phrasing of the treaty's stipulations to extend British authority over the islands. British rule was a form of benign authoritarianism. Maitland and his successors used their all-powerful position to effect lasting improvements in the condition of the islands: a major road-construction scheme was carried out, direct taxation was abolished, an impartial justice system established, agricultural reform implemented, and educational institutions created. But public security and material prosperity failed to secure the goodwill of the Ionian population. Already resentful of authoritarian British rule, the administration's preference for Corfu over the other islands and the neglect of the interests of the local peasantry further alienated the Ionian islanders. At the root of this growing disaffection, however, was Greek nationalism, which was steadily gaining strength. Existing opposition was further fomented by Maitland's decision to prevent the islanders from lending assistance to the mainland Greeks in the War of Independence of 1821. Maitland's successors continued his policies, often in a high-handed manner. Sir Howard Douglas (1835–41) was continually faced with intrigues, most prominently led by Andreas Mustoxidi.

The firm policy of Maitland and his successors was replaced by a more lenient approach to the administration of the islands in the 1840s. The European revolutions of 1848–49 provided the spark for local risings against the protectorate and for union with Greece on Cephalonia and elsewhere. The High Commissioner Lord Seaton (1843–49) and his successor Sir Henry Ward (1849–58) tried to appease the unionist movement by offering concessions. It was hoped that a general amnesty of 1 August 1849 would bring an end to the troubles. But renewed violence and an agrarian revolt on Cephalonia at the end of that month dashed such hopes, and the rising was ruthlessly suppressed by military force.

On the restoration of order Ward continued to initiate a series of reforms. A new constitution, granted in November 1849, extended the franchise to all adult males, and offered a wider scope for the activities of the general assembly. In effect, the new constitution marked the end of the ascendancy of the old Venetian one and strengthened Hellenic elements hostile to the British protectorate. The reforms did not prevent the further spread of the Greek nationalist movement on the islands, with the legislative assembly repeatedly using its constitutional liberties of speech and comment to pass resolutions in favour of immediate union with Greece.

Britain's foreign secretary, Lord Palmerston, had always firmly held that continued possession of the Ionian islands, and especially of Corfu, was crucial to the maintenance of Britain's naval position in the Mediterranean. By the late 1850s, however, the islands in this respect had sunk to a position of secondary importance behind Malta. Thus, while the islanders' opposition to British control remained unabated, Britain became decreasingly interested in the continuance of the status quo.

The hopes of the Greek nationalists were raised in 1858 when Palmerston, by now prime minister, found himself in a minority in parliament and resigned. The incoming Conservative administration appointed William Ewart Gladstone as Lord High Commissioner Extraordinary to the Ionian islands. Such a mission by a statesman of Gladstone's stature – a figure well known, moreover, for his Philhellene inclinations – could not but excite unionist hopes. Gladstone, however, was not appointed to bring to a close the protectorate, but to investigate the condition of the islands and to examine their relations with Britain. His brief mission was hampered from the outset by press speculations in London and by a vote of the Ionian assembly declaring union with Greece to be the *thelesis* (absolute and unanimous will) of the islanders. Not surprisingly, Gladstone's mission failed to produce tangible results. The constitutional reform projects with which he had busied himself were buried in a series of reports which were never published. Whatever hopes the Greek nationalist movement may have had of Gladstone's short tenure as High Commissioner were dashed when, after his tour of inspection, he concluded that the majority of the islanders did not wish for the abolition of the British protectorate. Under Gladstone's successor, Sir Henry Storks, who took up his position in February 1859, the contest between the legislative assembly and the protecting power continued. Unionist sentiments remained strong but the British government was slow to realize its precarious position. Indeed, Gladstone himself, by now Chancellor of the Exchequer in Lord Palmerston's last cabinet, declared in 1861 that the cession of the islands to Greece would constitute "a crime against the safety of Europe"; and Storks's reports ignored the discontent of the native population.

While the British government had long realized that the cession of the islands to Greece was not inimical to British interests, it was reluctant to act upon this realization for general strategic reasons. The Greek court under the (Bavarian) King Otho leaned heavily towards Austria's power in the northern Adriatic. Cession of the islands to Greece might therefore conceivably have led to a significant increase in Austrian naval power in the Adriatic and the approaches to the eastern Mediterranean. Barring a complete change in mainland Greek affairs, there was little prospect of any British government consenting to the union of the islands with Greece.

Change, however, did come in October 1862 with the outbreak of the Greek revolution, in the course of which King Otho was forced to abdicate. The Ionian assembly once more reiterated its unionist demands. Now the British government was quick to seize the opportunity of testifying its sympathy with Greek nationalist sentiments and of ridding itself of the Ionian burden in a manner that was not adverse to British interests. The provisional government in Athens was informed that if the Greeks elected to their vacant throne a candidate approved of by queen Victoria, Britain would surrender the islands to the kingdom. The election of the Danish prince Waldemar George of Glücksburg, the brother-in-law of the prince of Wales, as king George I of the Hellenes fulfilled the conditions required by Britain. On 7 October 1863 the Ionian assembly was specifically convened for the purpose and signified its assent to the transfer. On 14 November a protocol was signed by the five great powers of Europe for the formal transfer of the islands to Greece. The final treaty was signed in London on 29 March 1864, declaring Greece, including the Ionian islands, to be a monarchical, independent, and constitutional state under the rule of king George and under the

guarantee of Britain, France, and Russia. By treaty stipulation, the fortifications on Corfu and Paxos were demolished, and the two islands, though part of the Hellenic kingdom, were declared perpetually neutral. The British protectorate over the islands had thus come to an end, although they retained their existing system of private law, taxes, and duties.

The final act of British rule came on 28 May 1864, when the last Lord High Commissioner, Sir Henry Storks, delivered the islands to the Greek commissioner. Storks left Corfu on 31 May 1864; in the following month King George received the homage of his new subjects; and in July the Ionian deputies took their seats in the national assembly at Athens. From now on the Ionian islands remained part of Greece, although they were occupied during World War II by Axis forces.

Summary

The seven so-called Ionian islands – Corfu, Cephalonia, Zakynthos, Leucas, Ithaca, Cythera, and Paxos – do not form a geographical unit. All had been ruled by Venice, but they did not form a political unit until 1800–07 as the "Septinsular Republic". Ceded to France in 1807, the islands became a British protectorate in 1815. They were united with Greece in 1864.

Ionians

Ancient Greek ethnic group

The term "Ionian" was employed in two senses in antiquity. In the first place it designated the Greek populations settled in the coastal cities of central Asia Minor and occasionally, by extension, the neighbouring populations in the Troad area in northwest Asia Minor (more properly Aeolians) and in southwest Asia Minor (more properly Dorians). This designation may possibly have originated as a general external appellation for Greeks, who were known throughout the east as Yawani (cf. Old Persian *Yauna*; Old Hebrew *Javan*). However, the term could also be used in a broader sense: in the historical period Athens, Euboea, the Cycladic islands, parts of Sicily (Naxos, Leontini, Catana, Zancle, Rhegium), Italy (Cumae, Siris) and the western Mediterranean (Massalia, Emporion) as well as the central coastal strip of Asia Minor all claimed a common Ionian identity on the basis of perceived similarities in dialect, rituals, customs, and shared origins. It is entirely possible that the second definition was a historically later extension of the first.

Recent archaeological excavations at Ephesus claim archaeological continuity from the Mycenaean age into the Geometric period. By contrast, although the Homeric epics list "Ionians with their flowing tunics" among the Greek contingents at Troy (*Iliad*, 13. 685), there is no mention of Ionians established on the coast of Asia Minor. Indeed, the earliest extant literary references stress that the Ionian cities of Asia Minor considered themselves to be relatively recent foundations from mainland Greece: the 7th-century elegiac poet Mimnermus (fr. 9) describes how Colophon was founded by Pylos, while 5th-century sources attribute the foundation of Priene to settlers from Thebes (Hellanicus, frag. 101), of Miletus to Neleus, son of the Athenian king Codrus (Herodotus, 9. 97) – dated to 1077 BC by the Parian Marble – and of Ephesus to another son of Codrus named Androclus (Pherecydes, frag. 155). Yet another tradition told how the Ionians had originally occupied the northern part of the Peloponnese but had been expelled by Achaeans fleeing the Dorian onslaught and sought refuge in Athens, from where they had set out to colonize Asia Minor (Herodotus, 1. 145, 7. 94; Pausanias, 7. 1. 2–4). It is no doubt the diversity of these foundation accounts as much as prejudice that caused Herodotus to question the ethnic homogeneity of the Ionians, attributing their origins to an admixture of Abantes from Euboea, Minyans from Boeotian Orchomenus, Cadmeans, Dryopes, Phocians, Molossians, Arcadian Pelasgians, and Dorians from Epidaurus.

Although Athens often plays a central role in many of these 5th-century foundation accounts, there is no explicit testimony that it subscribed to a shared Ionian identity before the early 6th century BC when the Athenian statesman Solon (frag. 4) referred to Attica as "the oldest land of Ionia". The Homeric *Hymn to Apollo* implies that Delos hosted a pan-Ionian festival, possibly by the middle of the 7th century BC, while the Panionium to which Herodotus refers (1. 141–142, 148) was a league of 12 cities (Miletus, Myus, Priene, Ephesus, Colophon, Lebedus, Teus, Clazomenae, Phocaea, Samos, Chios, and Erythrae), centred on the sanctuary of Poseidon Heliconius at Cape Mycale, which was certainly functioning by *c.*600 BC and possibly even earlier.

At the level of dialect, cult, and institutions, Ionian cities shared some undoubted commonalities, though these were not always exclusive or universal. The dialects of the cities of Asia Minor and the Cyclades are the closest and are related to the dialects of Attica and Euboea, but the Ionic dialect also seems to have been spoken in the Dorian city of Halicarnassus by the 5th century BC. A number of festivals (Anthesteria, Apaturia, Boedromia, Lenaea, Plynteria, Pyanopsia, and Thargelia) appear to be characteristic of Athenian and Ionian calendars, although Herodotus (1. 147. 2) says that the Ephesians and Colophonians do not celebrate the Apaturia. Similarly, the

citizen bodies of many, though not all, Ionian cities were distributed among the four Ionian "tribes" of the Hopletes, the Aigikoreis, the Geleontes, and the Argadeis.

From the end of the 7th century BC the Ionian cities of Asia Minor were subject to periodic attacks from the neighbouring Lydians, culminating in their conquest by Croesus of Lydia in the mid-6th century and then their incorporation into the Persian empire following Croesus' defeat at the hands of Cyrus the Great *c.*546 BC. Whether as a result of crippling taxation demands and autocratic abuse or simply the personal ambitions of Greek puppet-tyrants, many of the Ionian cities revolted from Persian rule in 499 BC under the leadership of Aristagoras of Miletus. With the assistance of Athens and Eretria as well as of Carians, Cypriots, and Hellespontines, the Ionians scored some early successes—including the sack of the Lydian capital Sardis—but the revolt was ultimately a failure; following a naval defeat at Lade in 494 BC where the Ionian contingent faced a Phoenician navy almost twice its size, Miletus was sacked and its inhabitants killed or enslaved. The Ionian cities passed back to Persian suzerainty until after the Persian Wars of 480–479 BC.

It may be as a consequence of the Ionians' perceived readiness to endure the rule of barbarians that Athens began to downplay its own Ionian associations: according to Herodotus (1. 143. 3), the Athenians and Euboeans avoided calling themselves Ionians because they were ashamed of the name (since *c.*506 BC much of Euboea had passed under direct or indirect Athenian control). This new attitude becomes particularly apparent after the Persian Wars when Athens began to stress its own autochthonous origins over its traditional Ionian ties, though this is perhaps prefigured as early as 508 BC when the Athenian statesman Cleisthenes replaced the old four Ionian tribes with ten new tribes named after Attic heroes. It was not, however, politically expedient for Athens to sever all ties with the Ionian cities of the Cyclades and Asia Minor—not least because Ionians constituted a majority of the cities of the Delian League who from 478/77 BC were required to pay tribute to Athens to secure protection against further Persian aggression. The solution that Athens adopted was to make slight but subtle modifications to the vocabulary of its relationship with its tributaries by which the Ionians were no longer placed on an equal footing of kinship but regarded as colonists owing their Athenian metropolis certain obligations. The dependency of this relationship was asserted at the quadrennial Great Panathenaea at which the cities of Ionia were instructed to provide a cow and a panoply to be displayed during the festival. At the same time, Athens sought to bolster a sense of common identity among its Ionian allies by promoting cults to Athena, Ion, and the four eponymous Ionian heroes on Samos and by reorganizing the pan-Ionian festival on Delos (Thucydides, 3. 104. 2). This exploitation of Ionian identity for political purposes became even more marked in the course of the Peloponnesian War, partly in opposition to the claims to shared Dorian origins that Sparta and its allies were proclaiming. Thucydides (3. 86. 3, 6. 6. 1) notes that early Athenian intervention in Sicily in 427 BC and again on the occasion of the later, disastrous Sicilian expedition of 415–413 BC was justified on the specious pretext of shared Ionian kinship.

Appeals to a common Ionian identity began to subside following the Peloponnesian War. Athens was now confident in its autochthonous origins, the Ionian cities of Sicily had begun subscribing to a broader "Siceliot" identity, and the Ionian cities of Asia Minor were effectively distanced from their Ionian kinsmen to the west by their reincorporation within the Persian empire – ratified officially under the terms of the King's Peace of 387/86 BC. The Panionium itself continued to function – at some point in the early years of the Peloponnesian War it had been transferred to Ephesus on the grounds of safety but then restored in the early 4th century to Cape Mycale where it is still attested in the Roman imperial period (Strabo, 14. 20. 1)—and throughout the Hellenistic and Roman periods Panionia festivals were celebrated in many of the cities in Asia Minor.

Summary

In antiquity two groups of people called themselves Ionians: the Greek populations in the coastal cities of central Asia Minor, and the inhabitants of Athens, Euboea, the Cyclades, parts of Sicily, Italy, and the western Mediterranean as well. The second group may simply represent a later extension of the first. Appeals to a common Ionian identity were frequent until the end of the 5th century BC.

Irenaeus *c.*AD 130–*c.*202

Bishop of Lyons and theologian

The birthdate of Irenaeus is unknown, but as bishop of Lyons he wrote to Victor, bishop of Rome, requesting that the Asiatic Christians in that city be allowed to celebrate Easter by their own calendar (Eusebius, *Historia Ecclesiastica*, 5. 24). Here and elsewhere, he appealed to the custom of his friend Polycarp, bishop of Smyrna, who suffered a famous martyrdom in the mid-2nd century. The inference that he himself was an emigrant from Asia is corroborated by his strong adherence to episcopal government at a time when it was not yet fully established in the west. His native tongue was Greek, as was that of his community, to judge by the letter in which they informed the Asiatic churches of the bloody persecution of 177. For all that, his major work *Against the Heresies* is preserved only in Latin, his *Demonstration of the Apostolic Teaching* was unknown before the recovery of an Armenian text in 1904, and his treatise against the heresy of Marcion is still lost.

Irenaeus' main objective in his five books *Against the Heresies* (*c.*180) was to demonstrate that the followers of the Egyptian Valentinus were not Christians. The esoteric doctrine that he professes to be exposing taught that the world was the creation of a harsh and ignorant (if well-meaning) Demiurge, who was himself the offspring of a temporary estrangement between the Father and his Wisdom or Sophia. The matter of this world, having been produced by Wisdom's error, was an evil to be escaped from; and therefore God could never have become incarnate, suffered the pain of martyrdom, or prefigured the resurrection of the body. In his first book Irenaeus rehearses the positions of Valentinus and his followers, comparing them with more notorious heretics such as the Gnostics, Basilides, and Simon Magus. In the next he refutes the Valentinian myth of a division in the Godhead, developing incidentally the first orthodox conception of a consubstantial and coeternal Trinity. In the third he summons the fourfold Gospel and the consensus of the bishops to testify that creation and redemption are the work of a single being, who truly took flesh and died upon the cross. In the fourth he explains that sin originates not with God but with the disobedience of the first human beings, who went astray while still too young to receive the divine perfection. In the fifth he adumbrates the joys of heaven, which cannot be complete without the regenerated flesh.

The *Demonstration* appears to be a later work (*c.*190) and certainly a lesser one. Apologetic rather than polemical, it informs an otherwise unknown Marcianus that the tradition of the Church upholds the divinity of Father, Son and Spirit, and after a brief account of the fall and redemption of humankind, proceeds to demonstrate the majesty of the Son from the theophanies of the Old Testament. It adds little to our understanding of the theology of the treatise *Against the Heresies*. The survival of the latter work in a Latin text of unknown date can be explained by the fact that it appeared to advance a doctrine of papal primacy, at least in the opinion of the translator (*Against the Heresies*, 3. 2). In the absence of the Greek, it is more prudent to construe the passage as saying that the metropolitan see is a perfect mirror to the consensus of the "faithful everywhere", without according any exceptional status to the Roman bishop by virtue of his office. Another misconception, fostered by the liberal revolt against Augustine, is that, since he holds that humans were created free and fallible, he ascribes to them a continuing and unlimited capacity for moral amelioration. It is true that Irenaeus could not accept, as Augustine does, that anyone is condemned for the sin of Adam, but he plainly believes that each of us inherits a liability to sin that would inevitably result in our damnation were it not for the work of Christ. This can be represented in his own words as an atoning sacrifice (5. 17), but his more characteristic doctrine is that Christ defeated Satan by an obedient life that "recapitulated" the disobedient life of Adam. Where Adam was born of virgin earth, Christ was born of Mary; where Adam fell to Satan's wiles in Eden, Christ withstood the temptation in the wilderness; where Adam was condemned to die, thus losing immortality, Christ died of his own free will to live again (*Against the Heresies*, 3. 21–22 etc.). His death unlocked the Spirit, the bond of love among the churches, and it is through the material sacraments of those churches that the faithful can become members of his resurrected body.

Orthodox theologians often trace to Irenaeus a distinction between the image of God, which all possess by nature, and the likeness that remains to be perfected in the Spirit through our individual virtues. While a single passage seems to teach this (5. 6), there are others that imply that both the image and the likeness were conferred at the beginning (5. 1), and others again that intimate that both lie in the future (4. 38. 4). Since the body pertains to both the image and the likeness (5. 6. 1), the image is not equated with our rational capacity, as in Origen and the Cappadocian Fathers. Since the incarnate Christ is the consummation of both the image and the likeness, it seems to be this gratuitous and peculiar act of God, not our inherent properties as a species, that enables us to speak of an affinity between creature and Creator. Orthodox theologians, after some centuries, retrieved Irenaeus' teaching on the sanctity of the body, but the Christocentric and evangelical principles of his thought have often seemed to be more congenial to the reformed tradition of western Christendom.

MARK EDWARDS

Biography

Irenaeus was born in Asia Minor *c.*130 where he was a friend of Polycarp, bishop of Smyrna, but he spent most of his life in Gaul and became bishop of Lyons *c.*178. His native tongue was Greek but his principal work, *Against the Heresies*, survives only in Latin and another work only in Armenian. He died *c.*202.

Irene *c.*752–803

Byzantine empress

The empress Irene is best known today for summoning the seventh ecumenical council, of Nicaea II (787), which restored the icons at the end of the first half of the iconoclast controversy (726 or 730–84). She is also notorious for having had her son, the emperor Constantine VI, blinded in 797. These two retrospectively fundamental events of her reign, however, mask a more complex and intriguing character who played an important role during a crucial period of Byzantine history. Irene's place in the history of the Greek mainland is also of some importance. Indeed, she appears to have been the first native Greek of either sex to have ruled the Roman empire in her own right and was the first woman to rule by herself – styling herself *basileus* (emperor) rather than its female equivalent, *basilissa*.

In 768 Constantine V chose Irene as a wife for his son and heir, Leo the Khazar (later Leo IV, 775–80). She was crowned during the wedding ceremony, and her name even appears in the regnal dating of one of her father-in-law's edicts. That Irene came from a notable Athenian family may indicate that the Isaurian dynasty's interest in restoring order in the Greek mainland predates her own initiatives as empress.

Irene's activities between her marriage and the death of her husband are unattested. Later stories about her secret iconophile sympathies prior to 780 are probably apocryphal. Initially she appears loyally to have accepted the prevailing iconoclasm, whatever her private feelings may have been. On the death of her husband in 780, she acted as regent for her young son, Constantine VI (780–97), and quickly secured the throne for him by excluding her husband's brothers, the so-called "Caesars", who were exiled to Athens after an unsuccessful revolt in their favour.

Irene originally relied heavily on loyal members of the court and military, including an ambitious general and minister, the eunuch Stavrakios. In 782/83 the latter led a campaign into northern Greece to subdue the Slavs and restore Byzantine administration in the region, thus paving the way for the gradual restoration of Byzantine rule in mainland Greece in the 9th century. Irene and her son took part in a triumphal procession in Thrace in 784 where, accompanied by loyal troops, she refounded the city of Berroia as Irenoupolis (now Stara Zagora) and improved defences in Philipoppolis (now Plovdiv) while generally strengthening Byzantine power in the region. The present church of Hagia Sophia in Thessalonica may date from this time and the iconoclast mosaic cross decoration therein includes medallions bearing the imperial monograms. Macedonia now appears as a *thema*, or province.

Irene: portrait of the empress on a gold coin, *c.*800

In 783/84 there is no indication that Irene was not adhering to the official iconoclast line. Byzantine historians inform us that she began to change her mind after the deathbed repentance of the iconoclast patriarch Paul IV in 784. After having supported or engineered the accession of the noted scholar and administrator Tarasios to the patriarchal throne in 784, Irene announced the convention of a council to restore the icons and unite the Church. Historians have long seen her efforts in this direction as a calculated game played from 780 at the latest, but there is no evidence to back this assertion. It would seem that Irene was genuinely "converted" or at least pushed into open action by the events of 784.

The council finally met in Nicaea in 787 after an attempt to begin proceedings in Constantinople in 786 had been disrupted by troops and a few bishops loyal to the memory of the iconoclast Constantine V. The council proclaimed itself ecumenical (Nicaea II) and acted as a reference point for the final restoration of the icons in 843. Irene regarded Nicaea II as a chance to unite the Church and suppress discord, a goal she seems to have considered more important even than the restoration of the icons itself. She showed her intentions in this respect again during the simoniac controversy of 789/90, when she alienated erstwhile monastic support by insisting that repenting simoniac bishops (those who had given or received money for consecration) should be restored to their sees.

The monks soon forgave her, however, especially those of the Sakkoudion monastery on Mount Olympus in Bithynia, who in 797 were given the dilapidated Stoudios monastery of St John the Forerunner in Constantinople to restore and maintain. Under St Theodore the Stoudite (died 826) this became the most famous of the empire's monasteries, and was to remain so for centuries. Irene's name was, as a consequence, long associated with imperial piety and munificence. It would be wrong, however, to see in her a slave of monastic interests since there was no united monastic front and Irene knew how to play one faction off against the other. Nor was the empress willing to abandon her imperial prerogatives when it came to

concessions (or "economies") made on her behalf by the Church. The elevation of Tarasios to the patriarchal throne in 784 and the simoniac controversy are cases in point. However, her generosity to charitable institutions and abolition of the municipal tax and of the customs' duties on the Dardanelles (800/01), although economically unsound by today's standards, were definitely sound by the political standards of a time when popular dissatisfaction could cause problems for an increasingly unstable regime.

Irene's undoing came in her rivalry with her son Constantine VI, who in 790 claimed the throne as his legitimate inheritance. Irene was forced into seclusion that year after the military intervened against her, but was recalled in 792 after Constantine had shown himself singularly incompetent. In 795 she helped to inflame the so-called Moechian controversy (over Constantine's divorce of his wife and "adulterous" marriage to his courtesan). Having undermined her son's position she engineered Constantine's downfall and had him blinded in the purple chamber of the palace in 797.

Irene subsequently ruled alone, styling herself on formal documents as *basileus* (two of these still survive – Dölger *Regesten*, nos. 358, 359 – and involve third marriages and oaths). In 802 she was deposed in a palace coup led by her minister of finance, the *logothete* Nikephoros, ostensibly because the palace eunuch Aetios had become far too powerful and dangerous an independent paragon at court. The empress was exiled to a monastery of hers on Lesbos, where she died a nun the following year. Her remains were, later on in the 9th century, translated to the imperial burial vaults of the church of the Holy Apostles in Constantinople.

Irene has not had a good press in modern histories. Her inability to stem the successes of the Arabs under the caliph Harun al-Rashid, to whom she had to pay tribute on at least two occasions, was criticized even in her own day. During her personal rule the Frankish king Charlemagne was crowned "emperor" in Rome by the pope and the Latins claimed that the imperial throne was vacant in Constantinople because Irene was a woman. But setbacks at the hands of two of the greatest leaders of all time can hardly be blamed on Irene alone. Indeed, her plans to unite the East and West by suggesting that her son marry Charlemagne's daughter, Rotrud (787), showed a shrewd insight that characterized her relations both with the papacy and the Franks. (Charlemagne even offered to marry Irene herself in 801/02, a prospect that alarmed many at court and may have hastened her fall.) Nevertheless, the severe problems faced by iconophile sovereigns between 780 and 813 were held, in 814/15, to justify the restoration of iconoclasm by Leo V. Irene was, perhaps unjustly, seen as initiating this decline.

Her failings have often been attributed – both in her own day and even in modern times – to her sex and the company she "naturally" kept as a woman: monks and eunuchs. In the modern consciousness the blinding of her son remains a notorious event that encapsulates the biased Enlightenment verdict of a Gibbon or Voltaire on Byzantium: it was the epitome of an entire civilization. Both conclusions need substantial qualification if Irene's remarkable reign and powerful character are to be fully appreciated.

Biography

Irene was born in Athens *c.*752. In 768 she was chosen by Constantine V as wife for his son, the future Leo IV. On Leo's death in 780 she acted as regent for her young son, Constantine VI, and reigned as co-empress from 780 to 790. Deposed from 790 to 792, she was restored as co-empress in 792, and reigned as sole empress from 797 to 802. She died on Lesbos in 803.

Iron

Iron differs from other metals used in antiquity in almost every way. The ores are widespread and abundant, but smelting requires much higher temperatures than other metals. Most smelted iron is inferior to bronze, but steel, an alloy of iron and carbon, has properties far in advance of other metals used in antiquity. However, the qualities of steel can only be brought about under carefully controlled conditions of temperature and chemical environment. For these reasons iron replaced bronze very gradually: although the first smelted iron dates from the 3rd millennium BC, iron only came into general use in the Aegean region around 1200 BC. A contributing factor may have been a shortage of tin for making bronze.

Iron is a common element in the earth and rich ores were readily available in antiquity. There were four principal types – metallic iron in meteorites, primary ore in rocks, iron-rich sands, and iron-rich fossil soils (laterites).

Natural metallic iron only occurs in meteorites and very rare terrestrial rocks not found in the Aegean. Meteorites were certainly known in the ancient Greek world: Anaxagoras of Clazomenae examined a meteorite and concluded that heavenly bodies were made of the same material as the earth. They were also venerated at Pessinus (Asia Minor) and possibly elsewhere, but no authenticated meteorites survive from this period. It has been suggested that some early iron objects were made of meteoritic iron on the basis of their chemical composition, primarily their high nickel content. However, such analyses may be suspect as it is only the oxidized surface that is commonly analysed, which is enriched in nickel. In addition, some iron deposits contain substantial quantities of nickel that were sometimes incorporated into the final metal. Finally, most meteoritic iron is difficult to work, unsuitable for making tools, and only available in small quantities.

Many of the primary ores exploited in Greece were precipitated where hot watery fluids released during the crystallization of granite reacted with limestone or marble. Such fluids

also carried other metals that were deposited under different conditions. Seriphos was the main source of such ores – the amount of slag from smelting indicates that seven million tonnes of iron were mined here from antiquity onwards. Two different ores were extracted: those at Playa near the centre of the island were deposited at high temperatures (500° to 600°C) and are rich in magnetite. The limonite iron deposits of Mega Livadi were formed at lower temperatures away from the granite. Similar deposits were exploited near Neapolis in the Peloponnese.

One of the largest underground palaeolithic mines in Europe was on Thasos. These deposits were initially exploited for ochre, a red pigment used for cult purposes. From the 9th century BC onwards extraction of iron ore for the production of metal became important from these and other deposits on the island. Sources were limonite/haematite ores associated with silver and gold ores formed in dolomite. Beach sands rich in magnetite and ilmenite (iron-titanium oxide) were also exploited here, and probably elsewhere in the Aegean.

Laterites are ancient "soils" rich in the iron mineral haematite that were formed during Early Cretaceous time (about 90 million years ago) when a tropical climate prevailed in Greece. Intense weathering of the serpentinite bedrock removed most of the chemical elements in solution, leaving behind a layer on the surface up to 10 m thick enriched in iron and nickel. In some areas the laterite was eroded and the sediments transported by rivers to be redeposited on top of Jurassic limestones. At the end of the Cretaceous period the sea invaded the area and limestone was deposited on top of both types of laterite.

Laterites were exploited for iron in Boeotia and Euboea. Pliny mentions an occurrence of iron ore near Hyettos, about 8 km north of Lake Copais. The deposits occur in the mountains northeast of Chalcis, near the Aegean coast (the range that includes Mount Dirphys), and on the adjacent mainland, in northeast Boeotia, between Lake Copais and the north Euboean Gulf. They can be seen as long, thin, meandering lines of dark-red rock between paler limestones or greenish serpentinites. Some of the same deposits have been exploited recently for nickel. Iron produced from these deposits under certain conditions of smelting contained some nickel.

In antiquity iron was used for statues, tools, utensils, and various decorative purposes. It was usually smelted and worked in the solid state, without melting. Iron ore and charcoal were packed into small cylindrical furnaces and fired to over 1000°C. Towards the base of the furnace some of the iron ore was reduced to tiny flakes of metallic iron by the charcoal. Further up in the furnace some of the iron ore combined with silica in the ore or parts of the furnace to form a molten slag dominated by iron silicates that prevented the metallic iron beneath from reoxidizing. The mass of metallic iron thus formed is called a bloom and is very pure. At the end of the firing the bloom was lifted out and the processes started again. The bloom contained much slag that had to be removed by hammering at orange heat (smithing) before the metal could be used. Some slag was always left in the finished product but this did not diminish its properties significantly and enabled pieces to be welded by hammering. Iron produced by this process was a soft metal that needed to be converted to steel by the addition of carbon before the metal could realize its full potential. To make steel suitable for weapons, smithed iron was packed in charcoal dust and sealed in clay containers to prevent oxidation. It was then heated to red heat for several hours to days. This mass of raw steel was worked to form the desired object. The final step necessary to develop the full strength of the steel was tempering. In this process the finished object was reheated to a special temperature and cooled at a controlled rate. With the precision necessary for all these steps it is no wonder that successful early smiths were so highly regarded.

Isaac the Syrian, St

Monastic author of the 7th century

Thanks to an early translation into Greek, Isaac the Syrian (Isaac of Nineveh) is the best known, and most influential, of all the monastic writers of the Church of the East. He was born and educated in the region of Qatar in the early 7th century, at a time when this area had a strong Christian presence. Some time in the late 670s he was appointed bishop of Nineveh (modern Mosul), but shortly after he retired to live as a hermit in the mountains of Khuzistan. His writings show him to be a man of considerable education and learning, and he draws on many different earlier Syriac and Greek writers; among the latter (which he read in Syriac translation) are the desert fathers, Gregory the Theologian, Evagrius, the Makarian Homilies, Theodore of Mopsuestia, Mark the Monk, Abba Isaiah, the Dionysian Corpus, and even the non-Christian *Life* of Secundus the Silent Philosopher.

His works have come down to us in their Syriac original in two parts, consisting of 82 and 41 chapters. Of these, the latter has been recovered only recently, while the former has long

been most accessible in the Greek translation made by the monks Abramios and Patrikios in the Palestinian monastery of Mar Saba, probably in the late 8th century. The translators must have worked from a Syriac manuscript which, on the one hand, omitted a number of chapters of the full Syriac text (19–21, 23–24, 26, 29, 31, 49, 54, 56, 71, 75, 76), but on the other hand included five texts that are not by Isaac. The first four of these extra texts (chapters 2, 7, 43, and 80 in the printed Greek edition) turn out to be translations of homilies by another monastic writer of the Church of the East, John the Elder, who flourished in the 8th century, while the final letter, addressed to an Abba Symeon, is an abbreviated translation of the letter to Patrikios by the Syrian Orthodox writer Philoxenos of Mabbug (died 523). Since the Symeon in question was for a long time identified as St Symeon the Younger, the 6th-century stylite who lived near Antioch, Isaac of Nineveh was dated to the same century, and it was only when a Syriac biographical notice was published in 1896, which mentioned his consecration as bishop of Nineveh by George, the Catholicos of the Church of the East (*c.*661–80), that Isaac's true date became apparent.

The Greek translation made at the monastery of Mar Saba has proved extremely influential: not only do a very large number of manuscripts containing it survive, but it also gave rise to many further translations into other languages. The earliest manuscript (fragmentary) belongs to the 9th century (gr. 693 in the Bibliothèque Nationale, Paris), and it must have been in the 9th century that the earliest translations of the Greek text were made into Arabic and Georgian: an Arabic manuscript written in Mar Saba monastery in 885/86 (Strasbourg, Ar. 4226) already contains excerpts, and the same applies to a Georgian manuscript dated 906 (Sinai, Geor. 35), also written in Mar Saba monastery. (Mar Saba remained a centre of great translation activity in the 9th and 10th centuries, well after the sack of the monastery in 813 and the departure of the brothers Graptoi, and other monks, to Constantinople at about that time.) A second, and fuller, Georgian translation was made in the late 10th century on Mount Athos by St Evthymios (died 1028), an indefatigable translator of Greek patristic texts into Georgian.

Excerpts from St Isaac feature in a number of medieval monastic florilegia. Thus, for example, he is well represented in the *Synagoge*, or *Evergetinos*, of Paul (died 1054) of the monastery of the Theotokos Evergetis. Excerpts can also be found in the still unpublished *Eclogae Asceticae* of John V (IV) Oxites, patriarch of Antioch (*c.*1089–1100), and in the Pandects of Nikon of the Black Mountain (near Antioch), of much the same date. Surprisingly, however, Isaac does not feature in the more famous 18th-century anthology published by Makarios of Corinth and Nikodimos of the Holy Mountain in 1782 under the title *Philokalia*. (Passages from St Isaac, however, were subsequently to be incorporated into the Russian (1884) and Romanian (1981) editions of the *Philokalia*; thus St Isaac features in E. Kadloubovsky's and G. E. H. Palmer's *Early Fathers from the Philokalia* (London, 1954), translated from Russian, but not in the complete English translation of the *Philokalia*, made from Greek.)

In the course of the Middle Ages further translations were made from the Greek text of Isaac into Arabic (and thence, Ethiopic), Slavonic, and Latin. The Slavonic translation belongs to the 14th century, and was probably made in Bulgaria, perhaps by a disciple of St Gregory of Sinai (*c.*1275–*c.*1346). The Latin translation (first printed in Venice in 1506) may be the work of Angelo Clareno, the translator of St John of Sinai's *The Ladder*, who died in 1337. It was not until 1770 that the Greek text itself appeared in print, published in Leipzig. The edition was prepared by Nikiphoros Theotokis, at the request of Ephraim, the patriarch of Jerusalem. Unfortunately Theotokis used late manuscripts as the basis for his edition, and at the same time reordered the chapters in order to provide what seemed to him a more logical sequence. As a result, the numeration of chapters differs markedly between the printed Syriac and Greek editions, and thus in all modern translations derived from these (convenient tables can be found, for example, in the English translation of the Greek published by the Holy Transfiguration Monastery, Boston). The current editions of the Greek text reproduce the re-edition by Ioakim Spetsieris (1895) which retained the chapter order (but not the pagination) of the 1770 edition. There is a pressing need for a new edition of the Greek text, based on the several early manuscripts available. A modern Greek translation, by Fr Kallinikos of the Pantocrator monastery on Mount Athos, was first published in 1871, while a demotic Greek rendering of chapters 15, 18, 24, 26, 31, 35, 62, 65, 66, and 68 (of the Greek edition) was made by Photis Kondoglou in his *O Mystikos Kipos* (The Mystical Garden: Athens, 1944; reprinted 1975). In recent times the Greek text has served as the basis for a French translation by J. Touraille (Paris, 1981), and an English translation by Dana Miller (Holy Transfiguration Monastery, Boston, 1984).

From this survey it can be seen that the initial Greek translation made in Palestine by Abramios and Patrikios has proved immensely influential over the centuries, far more so than has been the case with the Syriac original. Often this influence has been through secondary translations made from the Greek. St Isaac's writings today remain widely read, and this is by no means confined to monastic circles, where of course they are particularly appreciated. He described the path to salvation as passing through three stages: repentance, purification, and perfection. The key to his continued popularity over the centuries certainly lies in the profundity of his teaching on the spiritual life in which the mystery of God's unlimited love for creation as a whole and humanity in particular serves as his fundamental starting point.

SEBASTIAN BROCK

Biography

Born near Qatar on the Persian Gulf in the early 7th century, Isaac became a monk of the Church of the East, and in the late 670s bishop of Nineveh. But he soon resigned from his see and went to live as a hermit in southwest Iran. He wrote in Syriac on ascetic and mystical topics but many of his writings were translated into Greek by the monks of Mar Saba and have been most influential.

Isocrates *c.*436–338 BC

Orator

Isocrates was an enormously influential Athenian rhetorician. Much is to be gained in understanding his views if it is noted that his life stretched from the time of Pericles to the victory of Philip of Macedon over the free Greeks at Chaeronea; he was first and foremost an ardent patriot of his city, yet he was willing to imagine his polis working as an ally with the newly emerging strongmen of the Greek world. Conservative in outlook, he was also a powerful spokesman for Panhellenism – however, a Panhellenism that always put his native city first. His work, chiefly long epideictic or "display" orations that were not in fact orally delivered (he did not possess a strong voice), was read and cited well into the Byzantine period; his style of writing, itself reflecting the influence of his teacher, the Sophist Gorgias, was widely admired and imitated as a model of Attic prose. He was also an important teacher of composition for orators and historians: many of his "students" were themselves to be significant figures in the field of letters.

His earliest extant works are six speeches that he wrote for others to deliver in courts of law: like his slightly older contemporary Lysias, he was a *logopoios* in his early years, after his family's wealth had been destroyed in the Peloponnesian War. He soon gave up this career, and turned to producing large-scale public orations and other essays. He wrote two encomiastic treatises, the *Helen* and the *Busiris*, much in the tradition of his teacher Gorgias. His *Evagoras*, an oration addressed to that Cypriot king's son and successor Nicocles, is one of the earliest pieces of biography in Greek literature, alongside Xenophon's *Agesilaus*. In a similar vein, he also wrote a number of open letters, primarily to kings in the Greek world.

Isocrates' main achievement, however, lay in his long and elaborate epideictic speeches. The *Panegyricus* (*c.*380 BC) is a Panhellenic speech advocating an all-Greek expedition against Persia, and at the same time defending Athens' imperial past and attacking Sparta. The *De Pace* (On the Peace, 355 BC) represents something of a change in views: it urges Athens to make peace with its rebellious allies of the Second Athenian Confederation (founded 378 BC) and recommends that the Athenians "make lasting peace with all the world", including Persia. A return to the views of the *Panegyricus* is represented by the *Philippus* (346 BC), although now the standard of Panhellenism is to be held by Philip of Macedon, working together with the Athenians at the head of an all-Greek coalition.

Some of his other great orations tell us more about Isocrates' life, political views, and influence. The *Areopagiticus*, written at about the same time as the *De Pace*, is a criticism of moral decay at Athens and a plea for a return to the limited democracy of Solon and Cleisthenes. In *Against the Sophists*, written early in his career (*c.*390 BC), Isocrates tried to differentiate himself from other teachers of rhetoric. The *Panathenaicus* (339 BC) is the last work he wrote and is a summation and defence of his career. Perhaps the most important statement of his views on rhetoric is contained in his *Antidosis*, written in 354/53 BC. It has many points in common with his earlier *Against the Sophists*; further, it contains extracts from his own earlier speeches, and may even allude at points to the famous defence of Socrates. It is in this speech that Isocrates states quite plainly that people can become better and more worthy if they become desirous of speaking well. Isocrates is reputed to have taught the orators Isaeus and Hyperides, and the historians Androtion, Ephorus, and Theopompus, though many today would want to modify this claim, emphasizing Isocrates' influence on others, rather than any actual instruction he may have given.

Isocrates' belief that rhetoric is crucial in the education of leaders became a central tenet of antiquity. For Cicero he was "the father of eloquence" and the "teacher of all orators" (*De Oratore*, 2. 10. 94). It is hardly surprising, then, that his work was influential throughout the Byzantine period. Isocrates was an important model for the Church fathers Basil and Gregory of Nazianzus. Further, he was a central figure for Byzantine educational canons, widely regarded as a model of Attic prose style and a source of moral *dicta*. The *Suda* relies heavily on his work; Manuel II Palaiologos mines him for *sententiae*. Further, his work helped to define the Byzantine ideal of Athens: it is significant that John Malalas groups him (*Chronicle* 214) with Pericles and Thucydides, as opposed to 4th-century BC figures. Despite the lack of interest in the first printed edition of his work (Aldus Manutius, Venice, 1493), he became a central figure in the modern period for defining the educational methods of cultural humanism: Werner Jaeger (*Paideia*, 3. 46) has noted that he is rightfully called the "father of humanistic culture".

JOHN DILLERY

See also Rhetoric

Biography

Born *c.*436 BC in Athens, Isocrates studied under the sophists Prodicus and Gorgias. In the 390s he wrote speeches for others to deliver in court. But soon he changed to producing large-scale orations and teaching rhetoric to others. His pupils are said to have included the general Timotheus, the orators Isaeus and Hyperides, and the historians Androtion, Ephorus, and Theopompus. His writings were much admired for their purity of style. He starved himself to death in 338 BC.

Italos, John

Philosopher of the 11th century

John Italos came to Constantinople in 1049 from south Italy with his father, a Norman, as part of a detachment of westerners who were asked to assist the emperor Constantine IX Monomachos (1042–55) in his campaign against the Pechenegs. His mother was probably a Hellenophone from Sicily or Calabria. He cannot have been very old at the time, although we do not know when he died or at what age so it is impossible to be sure. Of his education, we know only that he eventually became a student and protégé of Michael Psellos and was in time granted the title *hypatos* ("first philosopher"). Italos became most famous as a champion of the dialectic taught by "the ancients", chiefly Aristotle, as is obvious from his extant works. If Anna Komnene is to be believed, he was enormously successful in his role as *hypatos*: "When he took up the chair", she writes (*Alexiad*, 5. 8. 9), "all the young flocked to him, for he opened up to them the teachings [*dogmata*] of Plato ... and Porphyry ... and especially the arts of Aristotle." Anna's portrait of Italos is not wholly favourable, however. She condemns him (5. 8. 5) as a near-traitor for carrying out a diplomatic mission to the court of Robert Guiscard; notes that he was twice accused of promoting dangerous theological doctrines and was "convicted" the second time, in 1082 (5. 9. 7); and criticizes his style as "rude" and "labyrinthine" (5. 8. 6). However skilful he was at dialectic, "his command of grammar was awkward, and he had not imbibed the nectar of rhetoric" (5. 8. 6).

In 1076/77 Italos was accused anonymously (and evidently without justification) of teachings contrary to Orthodox doctrine and tradition. On this occasion, apparently, the emperor Michael VII Doukas (1071–78) intervened, and Italos was able to retain his position as *hypatos*. It may have been in the period after his first "trial" that Italos composed his *Aporiai*, given confidence, perhaps, by the knowledge that he was under imperial protection. In 1082/83, however, he was not so lucky. Michael had by then abdicated the throne and retired to a monastery. Italos, accordingly, was condemned – on charges that most scholars now think were without foundation – and forced into a monastery.

Among the better-known students of John Italos are Eustratios (who himself was condemned in 1117 for holding that Christ reasoned in an Aristotelian fashion) and Joannes Petric'i (who returned to his native Georgia and produced Georgian versions of Aristotle's *Topica* and *De Interpretatione*). It is not clear whether Theodore of Smyrna, his successor as *hypatos*, was one of his students.

Italos produced several short elementary texts when he was tutor to Andronikos Doukas, Michael's younger brother, including: "To His Royal Highness Andronikos, on His Questions About Dialectic"; a "Synopsis" of the art of rhetoric (wrongly thought by some to have been a synopsis of Aristotle's *Rhetoric*); and a short treatise explicating the dream in *Odyssey*, 19. 560ff. The recently published "Synopsis of the Isagoge from the Lectures of John the Philosopher" (see Further Reading: Romano) might also have been meant for Andronikos.

THOMAS M. CONLEY

Biography

Born in southern Italy *c.*1025, John Italos moved to Constantinople around 1049 and became a pupil of Michael Psellos. In time he replaced Psellos as *hypatos ton philosophon* ("first of the philosophers"). He became the champion of Aristotelian dialectic but fell foul of the emperor Alexios I Komnenos and in 1082 was banished to a monastery. His date of death is unknown.

Italy

The Italian peninsula in southern Europe in which the Roman empire later emerged has been exposed to interaction with Greek civilization throughout its recorded history. Many tribes made up the population of the Italian peninsula, which is one of the reasons why the unification under Rome was considered to be a great achievement. Evidence of Minoan and Mycenaean trade has been found in many places, particularly in the southern part of the peninsula and Sicily. There is a history of political, cultural, and religious relations, and intricate reciprocity of influence from one side to the other. Relations with the Greek world were first established by the Etruscans, located mainly in northern Italy. To give one simple example, the Latin alphabet is believed to have been borrowed by the Romans from the Etruscans, who in their turn had taken it from the Greeks *c.*700 BC. Etruscan art, particularly sculpture and painting, as well as architecture, largely followed the development of Greek art, although it was significantly different. Etruscan culture influenced early Rome in its political organization and religious cults. Whether originating from the East (according to Herodotus, who believed that they came from Lydia), or indigenous Italian (as Dionysius of Halicarnassus thought them to be), their expansion depended much on trade. Through trade they came into contact with many people. Contact with the Greeks was intensified after Greek colonization.

In the period from 800 BC to 500 BC, traders from Greece reached south Italy and Sicily. Mostly for reasons of overpopulation and unfair distribution of land, as well as the need for expansion of trade, Greeks began to colonize places abroad that could offer rich agricultural production and defensible harbours. The use of the terms "colonization" and "colony" for this new kind of settlement is extremely misleading since many of the modern connotations attached to them are not applicable. With the exception of Athens and Thebes, most Greek city states seized every opportunity to expand, particularly in south Italy and Sicily where the climate and agricultural possibilities are very similar to those in mainland Greece. The first Greek settlement (*c.*750 BC) was at Cyme, mostly known by its Latin name Cumae, founded by the cities of Chalcis, Eretria, and Cyme in Asia Minor. Sparta founded only one colony, Taras, in south Italy in 706. Corinth established Syracuse in Sicily in 733 BC. Naxos founded Naxos in Sicily, Chalcis founded Leontini and Catane, Megara founded Megara Hyblaea. Chalcis later founded Rhegion (modern Reggio) in Calabria. By the 5th century BC, south Italy (but not Sicily) was referred to as "Magna Graecia". Many of the cities that were founded in Archaic and Classical times still bear traces of their Greek past, such as Taras (Latin Tarentum), Syracuse, Poseidonia (Latin Paestum), Tauromenium (Latin Taormina), Acragas (Latin Agrigentum), or Gela. A colony was a separate polis. Although it was independent of the home state, it maintained real links with the mother city. The mother city was often asked to protect the colony when in danger, and the Sicilian expedition in the Peloponnesian War is an example of the kind of relations and tensions that prevailed between mother city and colonies.

The Greeks often came into contention with the people of the Italian peninsula. The Etruscans were defeated by the Greeks at Cumae in 474 BC. Meanwhile, until the 3rd century BC Rome was expanding rapidly in the Italian peninsula. The Latin tribes, the Oscans, and the Samnites soon came under Roman control. There remained only the Greek city states of the south. In the 3rd century the Greeks of Taras, alarmed by Roman expansion, asked for help from Pyrrhus, king of Epirus. He defeated the Romans at Heraclea and Asculum (280 BC and 279 BC) but lost the battle at Beneventum in 275. After that the Romans were kept busy in their wars against the Carthaginians from 264 to 146 BC. They were, however, also drawn into the turbulent affairs of the Hellenistic world – in the Aegean against King Philip V (221–187), and further east against King Antiochus III (223–187). In a series of Macedonian wars enmities among the various Greek city states and leagues also played a significant role. In 197 BC Philip V was defeated and Greece was declared free after the battle of Cynoscephalae. There was now a precedent for Roman intervention in Greek and Hellenistic affairs. King Perseus, the son of Philip V, was no more effective than his father against the Romans. Thus in 146 BC Greece became a Roman province; and in 133 BC Pergamum was bequeathed to Rome by King Eumenes III and also became a province.

Besides action at the military and political levels, it was with the Roman conquest of the Hellenistic world that Hellenic, or rather Hellenistic, culture permeated many aspects of Roman life. An attempt was slowly made to create a Roman literary culture according to the Greek ideal. Already from the time of the Carthaginian wars attempts had been made by Livius Andronicus to translate Homeric epic poetry into Latin. Plautus wrote comedies in the style of Menander. Accius and Pacuvius also wrote comedies and tragedies. Besides the adaptation of many literary genres that had flourished in the Greek world the Romans tried to explore unique Roman ideals in literature and philosophy, that would be canonized later in the Golden Age of Augustus. Cato the Elder reproached the Romans for imitating the Greek way of life. In the realm of religion many cults of the Greek city states entered the Roman pantheon, particularly that of Dionysus. Greek deities had already acquired their position in the Roman pantheon and been given a Latin name. In art and architecture, the meeting of the Greeks and Romans became even more obvious. Many models were copied. Greek educational principles were also transmitted to Rome. Later, both in the republic and in the empire, many Romans went to Athens to pursue their studies, especially in philosophy and rhetoric. In the philosophical works of Cicero it became obvious how Hellenistic philosophy acquired a Roman setting and terminology. Earlier poets, like Lucretius or Catullus, as well as the poets of the Augustan age, drew context and forms from the early Greek literary productions as well as from Hellenistic culture, transforming them into completely new material. Prose writers such as Livy also inherited some elements from their Greek predecessors. On the other hand, there were Greek authors, such as Dionysius of Halicarnassus, Diodorus Siculus, and Polybius, who wrote in Greek about Roman matters. After the unification of Italy under the Roman empire, the meaning and identity of the word Roman was established. But there were still Romans who wrote in Greek, such as the emperor Marcus Aurelius in the 2nd century AD. Many scholars have seen in this period a decline of the Classical ideal, whereas in fact it bears witness to

the emergence of new, well-defined tendencies in literature, philosophy, religion, and art.

The spread of Christianity soon reshaped the tensions in the Mediterranean world. The interaction between Greek and Italian was acquiring a new dimension as the Christian religion grew stronger. At first, the new debate of Christian versus pagan appeared in contemporary literary and rhetorical writings, whereas later, once Christianity was established, the debate centred on the Greek versus the Latin rite in ecclesiastical matters. With the establishment of Constantinople as the "new Rome" the polarity between East and West entered a new phase.

In the 8th and 9th centuries, the period of iconoclasm, many educated men sought refuge in peripheral regions of the Byzantine world. Many migrated to south Italy, bringing with them their literary and artistic traditions. The wave of migrations to Italy included many monks and priests. Undoubtedly iconoclasm played an important part in the severing of relations between Byzantium and Italy. Politically, by the 9th century, the republic of Venice had become independent of Byzantine control. In the south, Byzantine influence increased as the emperor Nikephoros Phokas was successful against the Arabs. The number of Greek monasteries and churches also grew. When by the 11th century southern Italy was relatively safe from Arab attacks, the Norman conquests gave a new shape to the history of this region. The Normans steadily advanced into Byzantine Italy. The 12th century marked a "renaissance" in Byzantine literature and art. Due to commercial relations that existed between Italy and Byzantium, many Italian scholars, particularly Venetians and Pisans, who resided in substantial numbers in Constantinople, transmitted Greek learning to the West.

Strained relations developed between Byzantium and Italy in the 12th and 13th centuries and the role of the Crusaders made the issue more complex. Byzantine trade was constantly losing ground to the Italian republics, particularly Venice, Genoa, and Pisa. The schism that divided the Eastern and Western Churches in 1054, for dogmatic reasons, had explosive political repercussions. The Crusades, especially the fourth in 1204, dealt a devastating blow to Byzantium. Despite the tension in political relations in the 13th and 14th centuries, the reciprocal influences in literature and art present one of the most interesting phenomena. Many Greek texts were preserved in Italian libraries such as those of the Vatican, Florence, Venice, and Naples. Around the time of the fall of Constantinople in 1453, many intellectuals fled permanently to Italy. Eminent scholars like Chrysoloras, Janus Laskaris, Argyropoulos, Bessarion, Chalkondyles, Musouros, and others worked extensively in Italy and spread their learning and culture in the West. Venice in particular, and also Florence, became important centres for the study of Greek literature. When typography was invented, the first editions of Greek books were often made by Italian humanists.

In tracing the roots of modern Greek literature to the 10th century AD, relations with Italy and Italian culture can be detected in many places. It was not only Greek texts that survived in manuscripts belonging to Italian libraries, but some entire works have a version in both languages. The *Chronicle of Morea* is preserved in an Italian version as well as in Greek (also in French and Aragonese). Relations with north Italy were more visible in Crete, which remained under Venetian rule from 1204 until 1669, when it became part of the Ottoman empire. Although there was significant political opposition to the Venetians in the beginning, the Cretan renaissance was soon in progress, activated especially by Byzantine scholars who fled to Crete. Authors of the Cretan renaissance like Georgios Chortatsis (*fl.* 1590–1600) or Vitsentzos Kornaros (1553–1613/14) were in close contact with the parallel movement in literature, particularly theatre, in Italy. At approximately the same time, a kind of lyric poetry was developed in Cyprus with evident Italian influence, particularly from Petrarch. They are mostly love poems in Italian hendecasyllables.

The meeting between Greece and Italy becomes more evident in the 17th and 18th centuries in the Ionian islands. They never formed part of the Ottoman empire, and during this period literature flourished there. Dionysios Solomos (1798–1857) became a representative and a "national" poet for Greece. He was educated in Italy and was nourished on Italian literature. It was only natural then that his first writings were in Italian. Although later he reached his full glory with themes deriving from the situation in Greece, he brought a new shape to poetry through his thorough knowledge of Italian forms. Andreas Kalvos (1792–1869), another poet of the Heptanesian school, was also educated in Italy. The poetry of Ugo Foscolo (1778–1827) and other classical Italian poets of the Heptanesian school influenced the direction that Greek literature took. Although scholars, poets, and writers in the late 19th and early 20th centuries absorbed French, German, and English influences, there remained many contacts between Greece and Italy. There are still some areas in south Italy where a Graeco-Italian language is spoken to this day. Its origins (ancient Greek or Byzantine) are hotly disputed.

The two World Wars completely transformed political relations between Greece and Italy but at an intellectual level the traditional affinity continued. The Italian Archaeological School has exerted tremendous influence in archaeology. Nowadays, especially through the European Union, the two countries are in a constant intellectual dialogue that has proved to be effective in all areas of human knowledge, particularly science, literature, and art.

Ivory

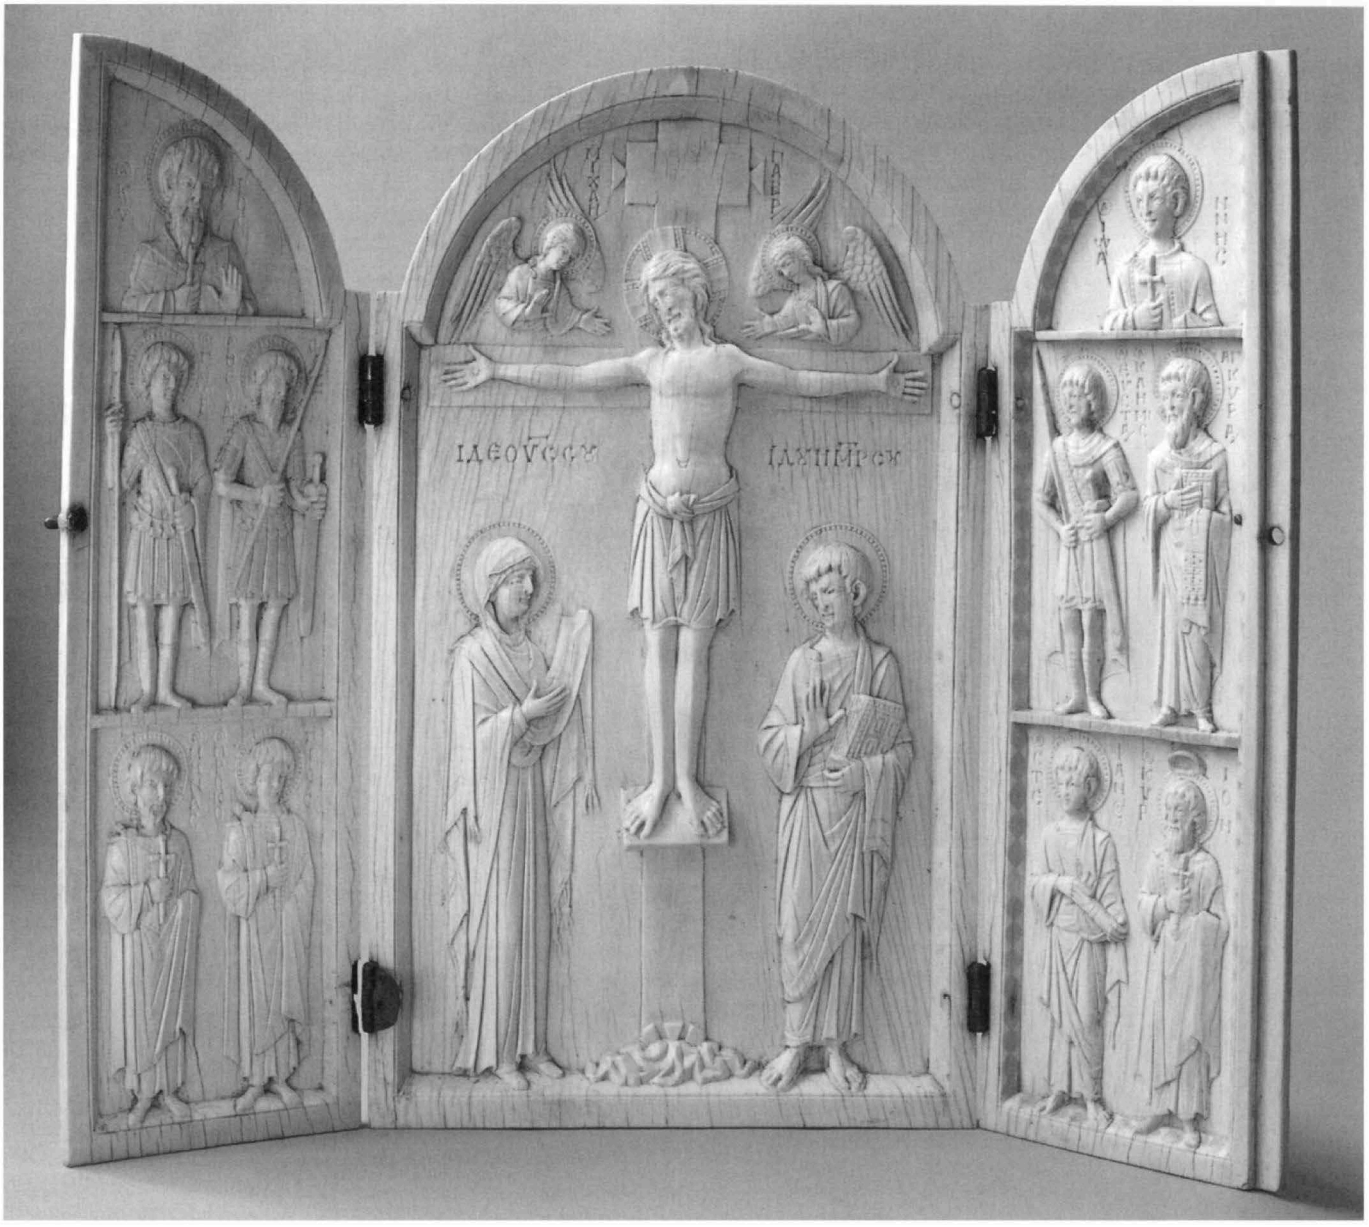
Ivory (*elephas*), properly speaking, is the dentine of elephant tusks, and it is from this material that the animal takes its name. The term also commonly denotes material obtained from hippopotamus, sperm whale, and walrus tusks, which, like all tusks, are teeth of continuous growth. There is no evidence that the last two animals supplied any of the ivory employed in the eastern Mediterranean, but elephant and hippopotamus ivory was imported to Greece, directly or indirectly, from the natural habitats of those creatures, i.e. Africa, the Levant, and India. Mammoth ivory, while available to Greeks in small quantities locally as well as from abroad, appears to have been rarely, if ever, used for carving, although a few chance finds may have served as trophies in antiquity, for example, the tusks of the legendary Caledonian boar. Actual boars' tusks adorned the helmets of elite warriors in the Mycenaean period and are mentioned in the Homeric epics.

Whatever its source, ivory was highly prized, serving as a symbol of wealth, status, and prestige from the Bronze Age, through the Classical and Byzantine periods, into the modern era on account of its exotic origins, aesthetic qualities, and reputed magical properties (as in the myths of Pelops and Pygmalion). Its smooth, creamy-white surface, warm lustre, density, and flexibility add to its appeal, and its physical characteristics allow it to be worked by a variety of techniques: it can be carved in the round or relief, cut into veneers or inlays, turned on a lathe, and even moulded. Most ivories were ultimately polished, painted, and gilded. A multipurpose commodity, ivory was employed in all periods in the manufacture of statues, reliefs, furniture components, appliqués, pyxides, handle attachments, pinheads, brooches, bracelets, combs and other toilet articles, seals, game pieces, and amulets.

The beauty and value of ivory are recognized in the earliest Greek texts, as in the Old Testament and earlier Near Eastern documents. The Mycenaean Linear B tablets inventory ivory weapons, chariots, and furniture, and similar objects mentioned in the *Iliad* and *Odyssey* symbolize royal affluence. That ivory-carving flourished in Minoan and Mycenaean society is also evidenced by numerous physical survivals from Bronze Age sites, including raw ivory from Zakros and the Ulu Burun shipwreck, and workshop debris from Knossos, Mycenae, Pylos, and Thebes. Reliefs intended for appliqué are the most common finds, but excavators have also recovered numerous other objects, among the finest of which are the fragments of a 50-cm-tall composite figure of a standing youth excavated at Palaikastro in eastern Crete (Siteia Museum). The exquisite carving of anatomical details of the Palaikastro youth far surpasses that of similar figures in all other media, underscoring not only the superior qualities of dense, fine-grained ivory as a material for sculpture, but also the fact that precious imported tusks were regularly entrusted to the most experienced craftsmen, who, presumably, had been trained in woodcarving, an art now largely lost. Blackened by fire, broken, and much restored, the Palaikastro statuette, like other unequivocally genuine Minoan ivory statuettes excavated at Knossos (Herakleion Museum), originally consisted of numerous individually carved components joined by complex systems of dowels and mortises. The Palaikastro figure also had rock-crystal eyes, stone hair, wooden nipples, and a golden loin cloth and sandals. This statue appears to have been painted, as were ivories in the Classical and Byzantine periods, although such ornamentation is often lost. (Technical, stylistic, and iconographic anomalies indicate that a number of "Minoan" ivory statuettes in collections outside Greece, inevitably said to be from Knossos, are modern forgeries.)

Ivory production in Greece naturally declined sharply during the so-called Dark Age of the late 2nd to early 1st millennium BC, but the material reappears in the Geometric and Orientalizing periods along with motifs and perhaps even craftsmen from the Levant; for 8th-, 7th-, and 6th-century carved ivories recovered from Crete, Athens, Ephesus, Samos, Laconia, Delphi, Perachora, and elsewhere, though sometimes exhibiting local stylistic features, closely parallel items that have been excavated in great quantity in the ancient Near East, particularly at Nimrud.

Like their Bronze Age ancestors, wealthy Greeks of the Archaic, Classical, and Hellenistic periods employed ivory, often combining it with other materials, to furnish their homes and gain the favour of the gods. Luxury furniture is best known from depictions on painted pottery and stone reliefs, but ancient texts, especially the inventories of the temples on the Athenian Acropolis and Delos, fill out the picture. Tombs have yielded fragments of ivory furnishings, but more have been recovered from sanctuaries. Indeed, many surviving ivory statuettes that are often presented as free-standing figures preserve cuttings in their heads or backs that indicate their original function as components of furniture, toilet articles, or even musical instruments. Most renowned in antiquity, however, were free-standing chryselephantine statues, composite works of gold and ivory. Produced at a variety of scales, these were assembled from individually carved ivory faces, hands, and feet attached to wooden armatures that were subsequently sheathed in gold. The hair of such figures, too, was rendered in gold, and these statues, gleaming and glittering in the half-light of temples or treasury buildings, presented stunning images of the gods. Most such works are lost and known only from later literary sources. Pausanias, for example, saw a number of early figures ascribed to pupils of the legendary craftsman Daedalus, as well as the gold, ivory, and cedarwood chest of Cypselus collected in the Heraion at Olympia. These objects do not survive, but a cache of votives from Delphi of the 6th century BC illustrates the technique and provides a notion of the appearance of such images, though they were burned in antiquity and are now much restored.



Ivory: 10th-century ivory triptych. The central panels show the crucifixion with the Archangels Gabriel and Michael, the Virgin, and St John the Evangelist, British Museum, London

Ancient authors explicitly state that the expense of ivory, along with its warm and lustrous colour, so closely approximating unblemished flesh, made it fitting for representations of divinities, and in the Classical period a combination of political and technological developments contributed to the unprecedented use of ivory in colossal statuary. The Athenian decision to erect a monumental statue of Athena (447–438 BC) inside the Parthenon was the result of competitive emulation. Monumental statues had long been erected in stone and bronze, but Phidias combined techniques of furniture-veneering, bronze-casting, and ship-building to create a gigantic composite work in gold and ivory approximately 12.75 m tall. Literary and physical evidence suggests that the Athenian sculptor adapted techniques of unscrolling tusks into thin sheets of ivory that were subsequently softened in acidic baths and then moulded in (or over) clay or wooden forms. This ivory skin, like the hammered gold that formed the drapery (weighing approximately 1137 kg in the case of the *Athena Parthenos*), was then affixed to a massive armature built around a wooden beam, the cutting for which survives in the floor of the temple. The resultant image of the ivory-skinned *Athena Parthenos* robed in golden garments ignited a trend throughout Greece as various city states commissioned similar statues of their own patron deities to demonstrate their piety, wealth, and power. Phidias' second essay in the genre, the *Zeus* at Olympia, came to be ranked among the seven wonders of the ancient world. Praised by numerous ancient authors, it was considered to have added something to traditional religion, and Phidias himself was thought to have travelled to Olympus, so accurately did he capture the essence of the god. This statue, like the *Parthenos*, is lost, known only from ancient descriptions and representations in other media. The workshop in

which it was produced, however, was identified by Pausanias, and has been excavated: ivory wasters, bone chisels, terracotta moulds for glass inlays, and even a cup inscribed with Phidias' name are among the finds displayed in the Olympia Museum.

Phidias reputedly made additional chryselephantine statues (and pseudo-chryselephantine ones consisting of marble and gilded wood) at Elis, Plataea, and Pellene, and ancient sources report that similar works were produced at Argos, Megara, Elis, Athens, Calydon, Delos, and Epidaurus in the late 5th and 4th centuries BC by Polyclitus, Theocosmos, Colotes, Alcamenes, Menaechmus and Soidas, and Thrasymedes. Previously reserved for representations of the gods, ivory statues eventually came to be employed by mortal rulers seeking their own glorification, beginning with Philip of Macedon and his son Alexander, who erected a chryselephantine family group by Leochares in the Philippeion at Olympia, not far from Phidias' *Zeus*. Later ivory portraits are also mentioned by ancient authors. Special provisions were made for the maintenance of the largest statues: at Athens and Olympia reflecting pools of water and oil, respectively, were considered beneficial to the ivory, and special "polishers" (or "descendants of Phidias") looked after Phidias' statues.

Meanwhile, ivory continued to be employed for the adornment of the many sumptuous objects mentioned above, as well as for the decoration of the doors and ceilings of temples, and even the panelled rooms of the luxury barges of Hellenistic kings. Best preserved are the composite figurines that decorated couches recovered from Macedonian tombs (Thessalonica Museum). The monetary value of ivory, which was worth approximately one quarter its weight in silver in the 4th century BC according to building inscriptions at Delphi, naturally fluctuated according to its availability. The eastern conquests of Alexander increased supply, and the vast accumulations of the material by his successors are demonstrated by the thousands of tusks recorded to have been displayed in later Roman triumphs. Some Greek ivory statues were eventually carried off to Rome, and the chryselephantine technique continued to be practised under Roman rule: at Athens the emperor Hadrian commissioned another colossal *Zeus* for the Olympieion, and Herodes Atticus dedicated a *Tyche* in that city as well a *Poseidon-Amphitrite* group at Isthmia.

The fate of most of the great Classical ivory statues remains uncertain. Ancient sources record almost 200 such works in Italy, Greece, and the eastern Mediterranean. Not one of these survives, but components of dozens of others have been recovered. Many, depicting pagan gods, were no doubt destroyed by Christian iconoclasts. Phidias' *Zeus Olympios* is said to have been carried off to Constantinople, where it appeared in a Christianizing allegorical programme in the Palace of Lausos, providing a model for the bearded image of Christ Pantokrator before being destroyed by fire in the late 5th century AD. On a considerably smaller scale, ivory continued to be a popular medium for works in diverse genres in the Byzantine period. That its price had fallen considerably from Classical times is clear from the Edict of Diocletian, which lists it at one-fortieth the value of silver.

From the 4th to the 6th centuries statuettes, caskets, plaques, furniture, and other items decorated in classicizing styles with motifs from pagan mythology as well as Christian iconography were produced in Egypt, presumably at Alexandria, as well as Constantinople. Although scholars debate the precise origins of many late Antique and Byzantine ivories, an edict of AD 337 lists ivory workers among artisans exempted from civil obligations so that they might improve their craft and instruct their children, indicating how techniques were transmitted. A slightly later edict restricts all but ordinary consuls from distributing ivory diptychs, suggesting the widespread manufacture of these ceremonial gifts, distributed to celebrate the donor's attainment of the highest magistracy. Many of these socially and politically significant objects survive, having later entered church treasuries on account of their valuable material and the high quality of craftsmanship.

Ivory supplies were apparently disrupted in the late 6th and 7th centuries, and when production resumed after iconoclasm the material was used in the manufacture of fewer types of objects, most bearing religious and/or imperial imagery (such as icons, diptychs and triptychs, reliquaries, and bookcovers), many of which were exported to the west. In the 10th and 11th centuries Constantinople appears to have been the thriving centre for the production of ivory icons, reliquaries, pyxides, and reliefs with Christian as well as pagan imagery, but, as before, the precise origins of many carved ivories of this period cannot be determined. After the fall of the capital in 1453, the Byzantine style continued to be employed in the old provinces for several centuries in the monastic centres of Greece, the Near East, Russia, and even Ethiopia in wood and bone as well as ivory. Following independence, Greece became a consumer of ivory goods along European lines more than a producer, importing billiard balls, handles, bangles, etc. The Treasury of Panayia Evangelistria on Tinos contains raw elephant tusks and others carved in African styles, apparently the dedications of a Greek trader of the 19th century. Since 1990 transport of elephant ivory across international borders has been banned by the Convention on International Trade in Endangered Species (CITES).

Janissaries

Elite corps of the Ottoman army

The *yeni ceri*, or "new force", commonly known as the janissaries, were an infantry organized under the rule of Murad I (1360–89), who established Ottoman control in Europe by conquering Bulgaria, Macedonia, Serbia, and Thrace – leaving the Byzantine capital of Constantinople surrounded by a sea of Ottoman-held territory. Over the course of this expansion, Murad became increasingly interested in having a military force which would be under his direct control (the permanent Ottoman army was at the time divided into cavalry and infantry – *musellem* and *yaya* – who were paid largely by fiefs, and who were under the control of their commanders).

To this end, Murad moved to organize a new slave military force, whose members were to be culled in the form of human booty taken from his conquered enemies. The selected individuals, Orthodox Christian boys from the newly taken Balkan territories, were sent to Bursa where they were educated in Turkish, Arabic, and Persian; converted to Islam; given an elite military training, and, if upon the completion of their education they were deemed fit, placed either in the janissary corps or the cavalry (the *sipahis*). This period thus marked a time of transition during which the old Ottoman military elites found themselves subordinated to this new group of fighters who answered directly to the sultan. Thus the new military elite of the Ottoman state had its origins in Balkan Orthodox Christianity.

The process whereby these Orthodox boys were selected for training for the janissary corps came to be known as the *devshirme* (lit.: gathering up, collection). Originally the term referred specifically to the one-fifth portion of the booty allowed as a ruler's right during conquest, a portion which Murad I had taken in the form not of money but rather of young prisoners. The *devshirme* came over time, however, to be a periodic tax levied against Christian subject populations. Again, payment was taken in the form of young men. As part of the tax system, the *devshirme* was instituted by Murad I's successor, Bayezid I (1389–1402), and was most dominant during the 15th century. The *devshirme* was ultimately abandoned in the 17th century. Agents responsible for gathering the *devshirme* tax travelled periodically throughout the Ottoman provinces, gathering up the most promising-looking childen on a per-capita basis, and gave the children over to a "driver" (*surucu*) who escorted them to Istanbul or Bursa for their training.

In Greek tradition, the *devshirme* is known as the *paidomazoma* (lit.: gathering of children), and has from the revolutionary period on been widely regarded as having been emblematic of Ottoman cruelty, anti-Christian activity, and exploitation of subject populations. In reality, however, earlier attitudes towards the *devshirme* seem to have been more nuanced. For the undeniable reality is that, for rural boys of the Balkan peasant classes, the *devshirme* was the only available means of upward mobility, and a very dramatic and effective one at that.

The janissary corps, as the elite personal corps of the sultan, was the pinnacle of the Ottoman military hierarchy, and its membership was attainable only to those taken through the *devshirme*. Children of Muslim families were not eligible, nor those of the urban middle classes. This paradox was in part the result of Murad I's desire to have a militia the loyalty of which could be guaranteed. Had the janissary corps' membership been drawn from the ranks of the Ottoman elites, who were theoretically in competition with the sultan's own power, this loyalty could potentially have been undermined. By relying instead on the most peripheral members of society for its membership, the sultan was able to make the janissary corps as free from external influence and interference as possible. So while Greek and Balkan Orthodox folk tradition memorialize the *devshirme* with the vocabulary of mourning and oppression, it must be kept in mind that in reality rural Balkan Orthodox families would have had good reason also to hope that their sons might be selected, in the recognition that the *devshirme*, brutal as it was in psychological terms, might provide their children with an education and wealth undreamed of in the provinces.

The janissary corps and the *sipahis* provided the core foundation of the Ottoman army throughout much of the Tourkokratia. They came also, however, despite the intentions of their original founder, to be in many instances a significant source of opposition to the sultanate. They played an important role, for example, in the deposing of Mustafa I in 1623, and sultans from the late 16th century on were threatened by rival leaders who would attempt to drum up janissary support against the ruler. For this reason the institution was the target

of Ottoman-sponsored abolition movements starting in the first half of the 17th century.

It is as yet unclear what percentage of the janissary corps as established and promulgated by Murad and his successors was actually of Greek origin. Ottoman archival documentation suggests that very few Greek children were taken in the *devshirme*, and that the overwhelming majority were of Serbian and Bosnian origin. Some scholars, in fact, argue that the *devshirme* was never undertaken in Greek lands. Nevertheless, the *paidomazoma* and the janissary corps are well-known features of the Greek national cultural/historical imagination right down to the modern era. During the Greek Civil War (1946–49), for instance, when the communists in the north began a programme of evacuating children out of the war zone and into neighbouring communist countries, the Athens government called the programme a "new *paidomazoma*", and argued that the children were being formed into new "janissaries". Thus the cultural significance of such terms is still great, even if the historical reality of the *paidomazoma* and the janissaries has, in the Greek context, perhaps been overstated.

Summary

The Janissaries (literally "new force") were an elite cadre of infantry first organized by the Ottomans in the 14th century. Made up of selected Orthodox Christian boys from the newly conquered Balkan territories, the Janissaries and their cavalry counterpart (the Sipahis) were trained to provide the fighting heart of the Ottoman army for much of the period of Tourkokratia.

Jeremias II Tranos *c.*1530–1595

Patriarch of Constantinople in the late 16th century

Born around 1530 on the coast of the Black Sea at Anchialos (near modern Burgas, Bulgaria), some 200 km northwest of Constantinople, Jeremias was very well educated by leading intellectuals of the day, such as Hierotheos of Monemvasia and Damaskinos the Stoudite, and perhaps at the Patriarchal Academy in the capital. He was elected bishop of Larissa (in Thessaly) in 1565, and, seven years later, through popular demand, ecumenical patriarch. This office he held three times: from 5 May 1572 to 29 November 1579; from August 1580 to late February or early March 1584; and from mid-1587 (officially only from 4 July 1589) to late 1595, when he died. Always retaining the support of his people, he owed his dethronements to jealousies of the Holy Synod dominated by the Phanariots and desire for the *peshkesh* (bribe) payable to the sultan for ratification of each appointment.

During his nearly 20 years as patriarch he proved himself, through competent and energetic administration, possibly the most able figure to hold that position during the Tourkokratia. He was a persistent opponent of simony and was particularly effective in attracting capable figures, most notably perhaps the theologian, poet, and translator Maximos Margounios, as friends or associates. His interest in education never wavered, and through a synod in 1593 he both encouraged metropolitans to establish academies in their cities and gave a new constitution to the Patriarchal Academy, in accordance with which departments of sciences such as chemistry and physiology were established in addition to the recently added philosophy and the traditional theology and literature, each department being overseen by a scholarch appointed by the patriarch. The best known of Jeremias's activities, however, are his correspondence with the Lutherans and his journey to Moscow and the Polish-Lithuanian Commonwealth.

Despite previous failures by the Lutherans (following a similar move by the Hussites as early as 1451) to form a united front with the Orthodox Church against Roman Catholic autocracy and its innovations, a further attempt was initiated in 1574. With the encouragement of the German ambassador in Constantinople, baron David Ungnad von Sonnegk, a group of theologians at the University of Tübingen led by the chancellor Jacob Andreae and the classicist Martin Crusius (Kraus) entered into communication with Jeremias. Copies were sent to Constantinople of a Greek translation of the Confession of Augsburg (Philip Melanchthon's statement of Lutheran views presented to the Diet summoned by the emperor Charles V in 1530), which contained 21 articles of faith followed by a list of "abuses" such as clerical celibacy, monastic vows, and compulsory confession.

Aided by the father and son Ioannes and Theodosios Zygomalas and other researchers, and after consultations with the German ambassadorial chaplain Stephen Gerlach (who had been summoned from Tübingen expressly for this purpose), Jeremias replied in 1576. His courteous but firm response methodically goes through the Confession, and, while accepting all the many points on which the two Churches can agree, it is chiefly a presentation of theological differences, including those of emphasis, and a defence of the Orthodox

position which is supported by numerous patristic quotations. The main stumbling blocks he found to any Orthodox rapprochement with the Lutherans were their acceptance of the Roman addition of the *filioque* (the procession of the Holy Ghost from the Son) to the Nicene creed; baptismal practices; the exact meaning of original sin; justification by faith alone without good works, and consequent near-acceptance of predestination; the number of the sacraments; the doctrine of the elements of the Eucharist and the use of unleavened bread; slighting of tradition; denial of spiritual value to many ecclesiastical ceremonies, fasting, monasticism, and celibacy of regular (as opposed to secular) clergy; and denial of the validity of invocations for mediation to the saints.

Replies from Tübingen elicited a more forceful presentation of the Orthodox position from an increasingly reluctant Jeremias in 1579 and, finally, a recapitulation in 1581 in which he begged for a cessation of the fruitless discussion. It is notable, however, that friendly correspondence with Crusius, who greatly admired Jeremias, persisted. This was in spite of a Polish Jesuit, Stanislaus Sokołowski, publishing in 1582 a Latin translation of the patriarch's first response with his own commentary (*Censura Orientalis Ecclesiae, de Praecipuis nostri Saeculi Haereticorum Dogmatibus*) as part of the Roman Church's attack on Lutheranism, which in turn instigated in defence Crusius's publication (1584, in Greek and Latin) of the whole correspondence between the Tübingen theologians and the patriarch. For the Greeks, however, Jeremias's three letters became an important statement of Orthodox belief and were endorsed as authoritative at the Synod of Jerusalem in 1672.

Since the Church in Russia, the only truly independent Orthodox state in the 16th century and, moreover, one considering itself the "Third Rome" and the protector of the true faith, was only a metropolitanate, it had made several demands for promotion to a patriarchate, thus replacing that of the heretical Rome in the pentarchy. In response to a further request, and in order to collect funds for his own beleaguered Church, Jeremias journeyed to Moscow in 1588–89. It appears that Boris Godunov, the chief minister of the feeble-minded tsar Feodor I Ivanovitch, proposed that Jeremias should stay in Russia with a see in Vladimir or in Moscow as ecumenical patriarch or patriarch of Moscow and All Russia. Whatever the exact proposal, Jeremias, with some reluctance since his restoration to the Constantinopolitan throne had not yet been ratified by the Ottomans, rejected it and instead presided over the elevation of the Muscovite metropolitan Job to patriarch on 26 January of the following year. His apparent compliance with Moscow's demand for its ranking immediately after Constantinople and Alexandria in the pentarchy had, however, to await confirmation at a synod in Constantinople attended by the other patriarchs, at which the new patriarchate was placed last after Antioch and Jerusalem. The interpreter on Jeremias's staff in Moscow, Arsenios, archbishop of Elassona (in Thessaly), stayed behind to spend the rest of his life in Russia where he became an influential figure in its spiritual life and wrote a detailed poem on the patriarchal visit.

Having thus, despite his dubious status, cemented a friendship with a powerful protector of Orthodox interests, Jeremias returned to the Polish-Lithuanian Commonwealth, through which he had passed on his way to Moscow and where he had held preliminary talks. Now, with the authorization of Sigismund III to take what action he liked in religious affairs, he deposed and replaced Onesifor Dziewoczka, the incompetent and lax metropolitan of Kiev and chief Ruthenian ecclesiastic. At a subsequent synod at Brest, however, on 6 August 1589, in addition to initiating reforms aimed at raising the moral standard of the clergy, he weakened the powers of the new metropolitan, Michael Rahoza, both by freeing from ecclesiatical jurisdiction and making answerable to himself the influential and largely lay Orthodox Brotherhoods of Vilnius and Lvóv and also by appointing as exarch the bishop of Łuck, Cyril Terlecki (Terletskyi), who thus became his personal representative. This attempt at more direct Constantinopolitan control over the Ruthenians was, however, nullified soon after Jeremias's return to Constantinople, when Terlecki himself was involved in discussions with the Catholics which led to the creation at, ironically, the Synod of Brest in 1596 of a uniate Ruthenian Church.

Halecki's cautiously proposed theory that Jeremias was probably at least cognizant of and not opposed to a Roman–Ruthenian rapprochement has been enthusiastically promoted by Tsirpanlis, who asserts that Jeremias was secretly negotiating with the Catholics in order to gain practical Western aid against the Turks even to the extent of initiating a new crusade (as Byzantine emperors such as Michael VIII Palaiologos had done openly). Thus, he claims, Jeremias dismissed Lutheran overtures even at the risk of displeasing the Ottomans (who made mercantile and military alliances with Protestant powers in their struggle against the Habsburgs and the papacy), and was also fully aware of and even encouraged Terlecki's intentions; while any overt opposition by Jeremias to the Catholics was dictated by the necessary prudence of a leader subject to their bitter foes.

Rome unquestionably did make advances to Jeremias: the popes sent ambassadors to Constantinople and in 1583 Gregory XIII personally praised the anti-Protestant stance of his replies to the Tübingen theologians, and after his deposition the following year even contemplated rescuing him from his Turkish prison in Rhodes and, in furtherance of religious reunion, installing him in Russia or, when the Polish king Stefan Batory expressed strong scepticism about the success of such a move, among the Ruthenian Orthodox in the Polish-Lithuanian Commonwealth. It is also beyond question that Jeremias did not rebuff all Roman Catholic approaches, even going so far as to express pleasure at the Greek College (established in Rome in 1577), despite the fact that it sought to convert Orthodox Greeks; and he was himself deposed in 1584 in part on the charge of pro-Roman sympathies, as was his predecessor (and successor) Metrophanes III, and even for being in secret agreement with the pope, although the percipient and sagacious papal envoy Antonio Possevino confessed himself unable to fathom the patriarch's intentions around that time. Jeremias was always conscious of the fact that through the Ottoman *millet* (community) system he was not only spiritual leader but also ethnarch of the Greeks, yet there is no instance of his compromising any article of Orthodox faith for mundane purposes; moreover, he opposed the establishment of the Society of Jesus in Constantinople and even rejected, after some genuine or perhaps politic hesitation, Gregory's repeated request for acceptance of his reformed calendar. Jeremias was

a truly ecumenical Ecumenical Patriarch, a highly intelligent and shrewd diplomat courteously polite to Protestants, Catholics, and Turks, but above all a shepherd ever devoted to the best interests of his Orthodox flock, for which he was willing to seek aid from whatever source he could.

Biography

Born *c.*1530 at Anchialos on the Black Sea coast of modern Bulgaria, Jeremias received a good education, possibly at the Patriarchal Academy in Constantinople. He was elected bishop of Larissa (Thessaly) in 1565, and ecumenical patriarch three times between 1572 and his death in 1595. He is remembered for his attempts to promote education, his correspondence with the Lutherans, and his journey to Moscow and the Polish-Lithuanian Commonwealth.

Jerusalem

The importance of Jerusalem for the Greeks stems first and foremost from its centrality within the Christian tradition. The Greek Orthodox comprise the earliest surviving Christian community in the city, and have always been the largest and most influential Christian community there. All Greek activity in Jerusalem throughout Christian history has been linked to the Greek Orthodox Church, and this is still the case in the present day. This linkage is evidenced in the dramatic change in the status of the city of Jerusalem following the Christianization of the Roman empire during the 4th century AD. A relatively unimportant city before the Christianization of Rome, after the empire's formal adoption of Christianity as a state religion Jerusalem rapidly emerged as a pivotal Christian centre. From AD 324 to 638 Christianity was the dominant cultural feature of the city, and Jerusalem a major religious centre for all Christians.

After his accession in 312, Constantine ordered that the Holy Sepulchre should be uncovered and a church built on the site. From that time on, Jerusalem rapidly began to take on the physical appearance of a Christian city, and came heavily under Greek cultural influences. Dominant among these influences was the Greek language, which was the tongue of the liturgy, and most of the clergy, monks, and nuns were of Greek origin and used the Greek language. This Greek dominance continued to prevail even after other Christian Churches had established bases in the city.

The Greek community was part of the Byzantine imperial Church and adopted the terms of the Council of Chalcedon (451). For the following two centuries the Byzantine imperial authorities made repeated efforts to establish the Church of Jerusalem as a bulwark againsr competing forms of Christianity within Palestine and Byzantium. These efforts greatly intensified the Greek religious and cultural tone of the city.

Jerusalem played a crucial role in the quarrels between the two important branches of the Eastern Church – the patriarchates of Constantinople and Alexandria – regarding the question of Jesus' nature (Christology). So strong was the city's importance as a centre of Orthodoxy that its last Byzantine patriarch, Sophronios (634–38), severed Jerusalem's relations with the patriarchates of Constantinople and Alexandria at various points when he felt that they had strayed from the doctrines of true Orthodoxy. The patriarchate of Jerusalem had complete control over the Church hierarchy in the region of Palestine, and the bishop of Jerusalem was its highest-ranking ecclesiast.

After the Muslim occupation of the city in 638 the Jerusalem patriarchate lost its control over the other Palestinian churches, but it remained by and large loyal to the leadership in Constantinople. Still under Islam, during the early 10th century, it became once again the head of the (greatly weakened) Christian community throughout Palestine, which was now administered as one diocese. From that time on, the patriarch of Jerusalem became the leader of all Orthodox Christians within the territory. The fact that there was a hazy line between Church and state organization in the Byzantine empire was a perennial source of political problems, stemming from questions regarding the loyalty of the patriarch of Jerusalem to the patriarchate in Constantinople.

Up to the 1970s, most of the higher ranks in the Jerusalem patriarchate were peopled with Greek-born Greeks, and its cultural character has always been Greek. Moreover, the upper stratum of the lay Greek Orthodox population has historically been Greek-speaking. After the Muslim occupation, much of the laity emigrated, or converted to Islam, or became Arabized. From the 8th century on, Greek texts were translated into Arabic, and Arabic emerged as the third language of the Greek Orthodox Church in Jerusalem (after Greek and Syriac). For this reason there has been a longstanding and constant tension between the higher-ranking Greek-speaking clergy and the lower-ranking, native Palestinian and Arabic-speaking clergy during Ottoman, British, Jordanian, and now Israeli rule of

Jerusalem. Nor was there much love lost between the Greek Christians and the Latin crusaders who ruled over the kingdom of Jerusalem from 1100 to 1187.

Because of the historically close connection between Jerusalem and Greece, a connection fostered by the strong Greek Orthodox presence in the city, political events concerning the Greeks in the west have also been felt in Jerusalem. Most notably, when the Greek War of Independence broke out in 1821, all Muslims were ordered to arm themselves in preparation for an anticipated revolt on the part of Jerusalem's Christians. The rumour spread throughout the city that all its Christians were in collusion with the Greeks, and only through the intervention of Muslim officials was the Christian population protected from attack.

With the decline of Ottoman power, the influence of the Greek community in Jerusalem contracted. This contraction was directly tied to the diminution of the formal privileges granted to the Greek Orthodox Church by the Ottomans through the so-called *millet* ("community") system, and was parallel to the similar decline in privilege of the Orthodox Church in Greece following the establishment of the Greek state. Greek presence in Jerusalem, however, continues to be felt. The possessions of the Greek Orthodox patriarchate in Jerusalem include many of the most important sites in Christendom. There are in addition a number of Greek monasteries in Jerusalem and the vicinity. The Greek Church also owns lands outside the walls of the old city of Jerusalem, where it established the colony of Nikophoria, known today as the "Greek Colony". Many of the Greek Church's holdings, however, have in the modern period been sold to Zionist organizations and to the Israeli government.

K.E. FLEMING

See also Crusades

Summary

Previously an unimportant city in the Roman empire, Jerusalem was propelled into international prominence by the Christianization of the empire in the 4th century AD. The Greek Orthodox have always been the largest and most influential of the city's Christian communities, but the number of Christians living in the city today is very small.

Jewellery

The art of jewellery making in Greece has a very long and continuous history that provides insight into everyday social and religious life and bears witness to the ingenuity and skill of Greek craftsmen throughout time. The earliest evidence in Greece for jewellery consists of a few small shells pierced with suspension holes that survive from the Palaeolithic period. By the Neolithic period (*c.*6800–3000 BC), however, jewellery making had begun in earnest. Consisting of valuable objects of personal adornment that may have originally served as protective amulets, jewellery during this early time indicated the wealth and social status of its owners. Common materials for jewellery in the Neolithic period included animal bone, shell, clay, stone, bronze, and gold. Precious stones were virtually unknown at this time, and silver was rare as well. Typical forms included highly stylized anthropomorphic pendants, beads for necklaces, simple finger rings, bracelets, pins, and mouthpieces. The gold and bronze jewellery from the Neolithic period is invariably hammered and cut into sheets. The discovery of precious gold and bronze jewellery in Neolithic cemeteries throughout Greece suggests the early emergence of a stratified society in this region.

During the Bronze Age in Greece the art of jewellery-making flourished under influence from the Near East and from Egypt, while also reflecting the unique ideas and inspiration of local craftsmen. Most pieces from this period were discovered in wealthy tombs, where they symbolized authority and prestige. From the Early Bronze Age (*c.*3200–2000 BC) several fine examples of bronze and silver jewellery survive from the Cyclades, including an outstanding silver diadem from Amorgos, with the top cut in a zigzag pattern, which is now on display in the National Archaeological Museum in Athens. Pendants and necklaces of bone, shell, and semi-precious or ordinary stone were common in the Cyclades. Some gold and silver diadems, earrings, pendants, and pins are also known from a few sites on the Greek mainland during the Early Bronze Age. Also important is a rich collection of jewellery, known as the "Thyreatis Treasure", in the Staatliche Museen in Berlin, which dates from *c.*2200 BC and includes an elaborate gold necklace with wedge-shaped pendants. It is thought to come from the Thyreatis in the Peloponnese. The best-known collections of gold jewellery of the Early Bronze Age, however, come from the northeast Aegean, especially from the site of Poliochni on Lemnos and from Troy. The hair spirals, necklaces, pins, and bracelets from these sites are especially impressive for their more advanced techniques, imported from Anatolia, which include filigree and granulation. Spectacular gold jewellery was also being made on Crete in this early period. The most famous examples from the Early Minoan tombs at Mochlos, now on display in the Herakleion Museum, include diadems made of gold sheet with repoussé decoration and fine chains of gold wire, as well as pins, pendants, beads, and bracelets.

During the Middle Bronze Age (*c.*2000–1600 BC) important advances in the technique of goldsmithing took place on Minoan Crete and resulted in jewellery of great artistic skill and sensitivity. One remarkable example that uses the filigree and granulation techniques with great effect is the famous gold pendant of two conjoined bees or wasps with a honeycomb

Jewellery: gold necklace with miniature pomegranates and amphorae, 4th century BC, Ashmolean Museum, Oxford

(dated *c.*1700 BC) that was discovered in the Khrysolakkos cemetery at Mallia and is now on display in the Herakleion Museum. Other equally elaborate pendants of gold combined with semiprecious stones belong to the well-known "Aegina Treasure", discovered in the form of tomb robbers' loot and now in the British Museum in London. This impressive treasure, dated to the 17th century BC, also includes beads, finger rings, earrings, and diadems of gold as well as gold cutouts in the form of discs with dotted rosettes, which would have been sewn on to garments.

The most remarkable jewellery of the Late Bronze Age (*c.*1600–1100 BC) comes from the royal shaft graves in the two grave circles at Mycenae, a citadel rightly described by Homer as "rich in gold". Dating mainly from the 16th century BC, the abundant gold objects from these tombs betray the powerful influence of the Minoan artistic tradition. Indeed, some of them are pure Minoan imports, while others may have been designed by Minoan craftsmen specifically for the Mycenaean market or by Mycenaean craftsmen working from Minoan models. This incredible jewellery, proudly displayed today in the National Archaeological Museum in Athens, includes fine gold diadems (for both sexes) with repoussé decoration; gold cutouts and roundels with repoussé octopuses, butterflies, spirals, and other natural and curvilinear motifs used to adorn luxurious clothing; as well as elaborate pins, earrings, bracelets, armlets, belts, signet-rings, and necklaces of gold, amber, and semiprecious stones.

During the zenith of the Mycenaean civilization (15th–13th centuries BC) the type of jewellery produced throughout Greece (with the exception of Crete) is different in many important respects from its forerunners in the shaft graves and elsewhere. For example, certain types of jewellery, including diadems, pins, and earrings, were no longer popular. Instead, necklaces with relief beads and pendants are very frequent. These beads and pendants are often in the form of stylized floral and marine motifs known from traditional Minoan iconography. The gold beads and pendants were made from gold sheet hammered into stone moulds, filled with magnetite sand, and often decorated with granulation, enamel (introduced *c.*1425 BC), grooves, and ribs. Moulded glass paste and faience beads were also used with increasing frequency as well as beads of semiprecious stones in a variety of shapes.

After the collapse of the Mycenaean world around 1100 BC, very little jewellery seems to have been produced in Greece for about 200 years. What little has been discovered from this period is of the simplest form, mainly hair spirals, as well as basic rings, bracelets, and pins, generally made of bronze, occasionally of iron, and rarely of gold that was probably

acquired by melting down precious metal hoards amassed from Bronze Age tombs. Between 900 and 600 BC, however, Greek contacts with the more prosperous Near East were renewed and the art of jewellery making was revived, initially in Athens, Lefkandi in Euboea, Corinth, and Knossos, and later throughout the entire Greek world. This early Iron Age jewellery exhibits the reintroduction of sophisticated techniques (e.g. repoussé, filigree, granulation, engraving, and inlaying with stone, glass, and amber), as well as the introduction of newer techniques such as the making of chains and the casting of gold. Forms and motifs of Minoan-Mycenaean jewellery were also reintroduced, though the occasional rediscovered object demonstrates the influence of the arts of Phoenicia and Asia Minor. New Eastern motifs appeared as well, including lions, sphinxes, griffins, and the "Mistress of the Animals", who later became identified with the Greek goddess Artemis. Among the most outstanding objects from this period is a pair of elaborate gold earrings with pendant pomegranates (*c.*850 BC) that were found in a rich woman's grave on the northwest slope of the Areopagus in Athens and are now on display in the Agora Museum. These earrings were probably made by an immigrant Phoenician artisan who set up a workshop in Athens and passed on his skill to local craftsmen.

Very little jewellery of the Archaic period survives from Greece proper, perhaps because of a shortage of gold that led to jewellery making in less durable materials such as bronze and silver. Spectacular gold jewellery does survive, however, from Cyprus, south Russia, and south Italy, suggesting that Greek goldsmiths were working for foreign customers. After the Persian Wars gold was more common in Greece, and although much of this was reserved for religious uses (e.g. chryselephantine statues), impressive jewellery was also produced. Greek jewellery of the Classical period continues Archaic types and decoration but the orientalizing figures and creatures are generally replaced with floral and geometric motifs (e.g. acorn- and vase-shaped pendants), while mythological themes and figures, such as Aphrodite and Eros, also become more popular. Rich decorative techniques such as granulation and filigree begin to decline and the simple sculptural forms of the gold are increasingly emphasized. What results is jewellery that is characterized by a more typically Hellenic sense of balance and restraint. Popular forms include diadems, earrings, necklaces, bracelets, and finger rings. Most impressive, however, are the new gold wreaths, with the leaves and fruit of oak, myrtle, olive, and laurel trees, which were received as prizes; worn in religious ceremonies, processions, and banquets; dedicated in sanctuaries; and buried in private tombs as signs of prestige and victory. Two such golden wreaths, one of oak, the other of myrtle, were found in royal Tomb II at Vergina, which dates from the late 4th century BC.

The Hellenistic period is arguably the greatest age of Greek jewellery. There is much surviving material because, for the first time since the Bronze Age, gold was very plentiful in Greece and Macedonia as a result of Philip II's annexation of the gold mines in the area around Mount Pangaeum in Thrace and the dissemination of captured Persian treasures following the eastern campaigns of Alexander the Great. The popular forms of jewellery in this period remained essentially the same with the addition of animal- or human-headed hoop earrings, necklaces with chains terminating in lion heads, necklaces formed of straps with pendant buds or spearheads, necklaces with linked rather than threaded beads, and medallions from the tops of ornamental hairnets that are decorated with high-relief heads of various Greek deities. Most remarkable, however, are the elaborate gold diadems discovered in wealthy tombs throughout the Greek world, which are most often decorated with the new central motif of the Heracles knot (a reef or square knot). This motif had an amuletic purpose as well as a decorative one, was associated with marriage and rites of passage in general, and, more specifically, was a symbol of Alexander the Great that evoked the idea of his kinship with the gods. One of the most elaborate examples of this type of diadem, dating from the 2nd century BC, was found in Thessaly and can be seen today in the Benaki Museum in Athens. The centre of this piece is a richly decorated Heracles knot inlaid with garnets. This decorative use of semiprecious stones as well as coloured glass and enamel was also an important innovation of the Hellenistic period that introduced polychromy into the design of Greek jewellery, thereby transforming its appearance.

During the Roman imperial period the main types of Greek jewellery were continued while their often complex designs incorporating naturalistic elements were gradually replaced with simpler compositions, including semiprecious and precious stones as well as stylized, curvilinear motifs. In the early Byzantine period this more abstract style developed into something quite delicate and refined, reflecting the well-attested Byzantine taste for expensive and elaborate jewels. The Byzantines were also well supplied, through domestic sources and trade, with gold, ivory, precious stones, and pearls, which were especially popular. Jewellery, meant to convey wealth and status, was produced for all members of the hierarchical Byzantine society. However, gold jewellery with precious stones was generally restricted to the court and to the Church, while poorer members of society might adorn themselves with plain, undecorated finger rings, bracelets, earrings, and buckles made of bronze, glass, brass, or silver. Rich court officials had beautiful signet rings characteristically decorated with complex monograms as well as elaborately worked sashes of office studded with precious stones.

The most impressive jewellery of the Byzantine period, however, was that which adorned the ears, necks, wrists, fingers, and waists of wealthy Byzantine ladies. In much of this jewellery ancient Graeco-Roman techniques and motifs persisted and were joined by newer techniques such as embossing, engraving highlighted by niello, and cloisonné enamel as well as by new Christian iconography. Popular forms included finger rings in gold, silver, bronze, and glass, which often had bezels adorned with imperial coins, inscriptions, or Christian motifs such as the common scene of Christ uniting the hands of a bride and a groom. Earrings were also very popular during this period and they come in a variety of forms including open-work radiate roses with pendant beads, decorated hemispherical or crescent-shaped discs, and hoops with pendant rods and beads of precious stone. Bracelets of many types are also among the finest jewellery of the Byzantine period. One especially impressive example from the 11th century, which demonstrates the persistence of naturalistic and orientalizing motifs in Greek jewellery, consists of two hinged pieces of gold with a broad band of impressed lions, griffins, and birds high-

lighted by niello. It can be seen today in the Kanellopoulos Museum in Athens. Also important were the necklaces with protective pendants in the form of pagan amulets, such as coins with the head of Alexander the Great, Christian crosses, and *constantinata*, popular coins with the head of Constantine.

During the difficult times after the fall of Constantinople and the Turkish conquest of Greece the Byzantine practice of wearing coins persisted as a means of transporting and protecting personal wealth, and pendant coins became one of the most common elements of the traditional Greek jewellery of the post-Byzantine era. This traditional jewellery, unlike that of earlier periods in Greek history, was usually made from silver for ordinary people to wear at weddings and other ceremonial events. Wealthy people occasionally did order gold jewellery in a traditional style, but more frequently imported jewellery from Europe as a sign of status. Imported western jewellery or imitations of it were also popular on the Greek islands during this time. But on the mainland traditional jewellery featured a sophisticated combination of metalworking techniques, such as hammering, perforating, casting, filigree, and granulation, as well as enamel working and, to achieve a polychromatic effect, the use of humbler materials including pieces of coloured glass, carnelians, agates, turquoise, rock crystal, and coral beads. Head ornamentation was an important aspect of this traditional jewellery which included elaborate diadems, often decorated with coins, and gold wire caps (*tepelikia*). Long earrings accompanied these headdresses and were often suspended from them. Large pectoral pieces and intricate necklaces (*yiordania*) were also an important feature of traditional jewellery. An impressive silver-gilt example in the Museum of Greek Folk Art in Athens featuring layers of hanging rosettes inlaid with coloured glass, stone, and cameos is typical of Attica, but the specific designs vary by region. Massive belt buckles, however, are the commonest type of traditional jewellery because they formed part of everyday as well as ceremonial dress. Aprons of coins, amulets, bracelets, and rings are also very common. But perhaps the most remarkable feature of traditional Greek jewellery is its continuity with past tradition, evident especially in the decorative motifs, an inexhaustible series of recreations and stylizations from the natural world, as well as in the apotropaic or magical motifs, such as pomegranates, two-headed eagles, crosses, and other Christian imagery.

The development of Greek jewellery in the modern period can be divided into two phases. The first phase begins with the liberation of Greece in 1827 and the abandonment of traditional costumes and their accompanying jewellery. European-style jewellery was widely imported during this time, leading to a decline in the age-old techniques and styles of Hellenic jewellery. In the 1940s and 1950s, however, foreign visitors to Greece began to demand Greek jewellery as souvenirs, leading craftsmen such as Agapitos Poulkouras and Joseph Rousanidis to begin producing silver jewellery featuring the monuments of ancient Greece and copies of ancient coins, which they sold in small shops around the Acropolis. During the 1960s there was remarkable growth in Greek jewellery as the result of increasing and more sophisticated international demand. In this context Efthymios Zolotas, Ilias Lalaounis, and others were instrumental in reviving ancient techniques and breathing new life into the traditional forms of Minoan, Mycenaean, Classical, and Byzantine jewellery. The success of these pioneers, the continued international demand, and the growth of Athens as a tourist centre, led the Greek Handicraft Organization to promote the entry of artists into the jewellery-making sector, thereby broadening its horizons. Like the traditional craftsmen of the past centuries, these artists, including the self-taught Sophia Thanopoulou "Maroulina", continue to draw on the incredibly rich diachronic heritage of Greek jewellery as well as on the forms and motifs of the natural world. As a result, even in its most contemporary, avant-garde creations, Greek jewellery maintains its unique tradition and is a remarkably eloquent expression of Greek cultural identity.

Jews

The Jewish encounter with Hellenic culture has been a continuing phenomenon for the past three millennia. This essay is meant to stimulate new approaches to this encounter from the perspective of Jewish influence on Hellenism. It is with the intellectual fusion of these two unique cultures during the Hellenistic period that the foundations for modern society were firmly laid. This essay will note the main points of the Hellenic–Judaic helix through two major periods (Hellenistic and Byzantine), and residual influence in the modern period. There will be a brief discussion of the origins of the

Hebrew–Hellenic encounter during the biblical period from about 1300 to 300 BC.

The contest between the Aegean migration following the Trojan War and the Israelite survivors of Egyptian bondage lasted throughout the 1st millennium BC: from the period of the Judges (12th–11th centuries) through to the Maccabean period (2nd–1st centuries). During this millennium the fusion had already begun: King David married an Aegean – Ma'akhah (perhaps Maxe/a), the daughter of Talmi (Ptolemaeos), tyrant (*seren*) of Geshur, and perhaps Eglah (better Aigle/a), and his mercenary corps was drawn from Philistines and Cretans. Thus the beginning of mutual influence dates to the first encounters between Hebrew and Hellene in Israel. Compare too the legends in the Book of Judges (compiled late 8th century BC: specifically the parallels between Jephthah's daughter and Iphigeneia, Samson and Heracles, etc.). Greek mythology recalls the Palestinian milieu while archaeology has uncovered the continuity of the Aegean diaspora in Israel throughout the late Judaean monarchy and the period of the Persian empire. The brief expansion of Hellenism in Israel under the influence of the Ptolemaic and Seleucid kingdoms was reversed by the upsurge of Maccabean nationalism and transmuted later by Hellenized Hasmoneans. It was only with the establishment of the Roman hegemony that the Hellenic polytheists reasserted their identity; at the same time the way was prepared for their later adoption of Christianity. The ability of the Aegean diaspora to survive the monotheistic revolution of the Israelites during the 1st millennium BC provided one conduit through which the Hellenic culture of Athens was able to penetrate Israelite society.

The historical and cultural background of the Hellenization of the Jews is fundamental to understanding the necessity for the appearance of the Septuagint. In turn, the Septuagint affected Hellenism and the Hellenes through Egyptian–Jewish polemic (e.g. Manetho) long before its appropriation by the Christians. Post-biblical Jewish influence on Hellenism during the period from the 6th century BC to the 6th century AD, which followed post-biblical influence of Hellenic culture on Jews and Judaism, set the pattern for the subsequent 1500 years of western civilization through the autonomous developments within Latin, Greek, and Slavic Christianity, as well as Islamic and Judaic civilizations, the last dispersed among all the former. It was based on a discussion of man(kind) in social, ethical, psychological (i.e. study of the soul), philosophical (i.e. study of wisdom), rational, scientific, and mystical contexts. Here the Jewish concept developed through the techniques of Greek philosophy and rhetoric to produce an intellectual framework and created the means to "adjust" Hellenism into a monotheistic world view that has sustained western civilization until the present day.

The contacts and mutual influence between the two independent cultures underwent serious change after the conquests of Alexander the Great. The incorporation of the land of Israel and its scattered colonies (henceforth "diaspora") into a Greek-dominated *oikoumene* (world) necessitated a fusion of Hellenic and Israelite culture if the latter was to survive in the newly defined diaspora which offered to anyone the opportunity to *hellenizein* (i.e. to become a Hellene by learning the language and customs of the conquerors). While the autonomous temple-based culture of Jerusalem and the proto-synagogue Aramaized culture of Babylonia were slow to Hellenize, the Jewish communities of Egypt quickly adapted to the new situation. Widely scattered as part of the administrative and military structure of Persian Egypt, they adjusted to the Macedonian conquest and flocked to the new city of Alexandria. Only fragmentary information is available on the early stages of a parallel process among the Jewish military colonies in Anatolia or the Jewish merchant colonies (metics) in Greece and Macedonia. The widespread Jewish diaspora can be later traced in the Greek translation of Ezekiel (2nd century BC), Philo's report of his embassy to Gaius (1st century AD), and the peregrinations of Paul of Tarsus (1st century AD).

The Jews acculturated rapidly to the new system, in particular through the adoption of the Greek language which replaced the Persian and Aramaic they had used under the previous empire. Within a generation after the establishment of the Ptolemaic kingdom they were Hellenophone, which caused a problem with respect to their sacred scriptures. Since the middle of the 5th century BC Ezra, a priest and royal scribe at the Persian court, had declared that the five books of Moses comprised their Torah, their God-given teaching (Josephus' *nomos*). Earlier prophets, such as Jeremiah, had emphasized the teachings of Moses with a stress on ethical standards and the command to remember their God and Zion. In Ptolemy's Egypt the Jews spoke Greek and so their Torah had become incomprehensible without the mediation of priests and preachers. Hence it was necessary to "interpret" a Greek version for these Jewish Hellenes.

The Septuagint, i.e. the translation of the "Seventy" as retold in the legend of the "Letter of Aristeas" (1st century BC), is one of the seminal phenomena of western civilization. It brought the Torah of Moses and the mythical-legal traditions of the Jews to the wider Greek-speaking world where it became part of the discussion between Hellenes and Jews, both polemically and apologetically, and also provided a means for syncretism as well as fusion of both Hellenic and Hebrew traditions. The Septuagint then was the Jewish claim to the ultimate historical and ethical truth in the Hellenic (i.e. Greek-speaking) *oikoumene*. Since it challenged Hellenic mythical-poetic traditions and philosophic posturings as did no other representation from the conquered peoples, it provided the intellectuals with a challenge to their own systems. Indeed, the first verse of the Septuagint, which allowed for a future doctrine of *creatio ex nihilo* somewhat different from the original Hebrew, would be at the centre of Christianity's polemic against polytheism and its critique of philosophy and science until the 20th century.

The impact of the Septuagint (the Pentateuch was translated in the 280s BC and the remainder by the end of the 1st century) was threefold. The Egyptian priest Manetho wrote an Egyptian history to show the Hellenes the antiquity of Egyptian civilization and its cult. He also denigrated the Jews in response to the Septuagint's rendering of the Exodus story. To his claim that the Jews were lepers banished to Jerusalem by the Pharaohs, later Hellenic rhetoricians from Alexandria and other schools added negative comments and misinterpretations about the Jews and their cult in Jerusalem. These were all gathered and refuted by a Jewish priest, Joseph ben Matityahu (Josephus Flavius), in his classic apologia *Contra Apionem*, written at the end of the 1st century AD. Yet the Septuagint and translations

of the former and latter prophets (Joshua to Kings and the classical literary prophets) as well as other scriptures (both those later accepted into the biblical canon and a host of others) added a wealth of historical and ethical material to support the Jewish world view. In the extant Hellenic literature of the Hellenistic and Roman periods there are as many pro-Jewish as anti-Jewish sentiments, attesting to a perceived powerful and magical secret wisdom among the Jews. And there is the phenomenon of Hellenes converting to Judaism or adopting Jewish ethical teachings, even as the evolving Judaism contributed to the multiplicity of syncretic religions and sectarianism that characterized the period.

Three seminal Jewish figures participated in this process, all three of whom were to become virtual if not actual saints in the Greek Orthodox version of Christianity that became the dominant religion of medieval Hellenism: Philo of Alexandria, Paul of Tarsus, and Josephus Flavius. Philo produced an intellectual synthesis of Mosaic teaching and middle Platonic philosophy that successfully allegorized ancient Hebrew legends and laws into the philosophic language of Hellenistic Alexandria. His extensive corpus of commentaries provided the later Church with the tools and materials that would enable it to Christianize this material for its missionary and didactic missions. Paul provided a different synthesis. He successfully reinterpreted the northern Mediterranean fertility myths through the language of Pharisaic Judaism into an expanded conception of the Jewish messiah, the annointed one (*o christos*) who would bring salvation to his followers. So Saul of Tarsus, a former Pharisee (biblical interpreter), used his training in the oral commentary to the Torah, which had been further developed through the adoption and adaptation of Hellenistic rhetorical devices, and became Paul, the teacher to the non-Jewish Hellenes of the new chapter in human salvation initiated by the career of a Palestinian Pharisee who had been crucified by the Romans and later resurrected by the God who made heaven and earth (*cf.* Septuagint, Genesis 1: 1ff). These two near contemporaries, Philo and Paul, thus provided the methodology and ideology for a new synthesis of Hellenistic society and its salvation that was to dominate Hellenism until the present day. Josephus, the third figure, was a priest in Jerusalem who became one of the military leaders in the revolt against Rome (66–73 AD). After his surrender to the Romans, he became tutor to Titus and later a client of the Flavians in Rome where he undertook to write the official story of the Jewish war with Rome (*Jewish War*, 7 books) and to retell the history of the Jews (*Jewish Antiquities*, 20 books). The works of Josephus Flavius were later accepted as a secular (if not divinely inspired) commentary to biblical history by the Christian Church. As such, these works entered the church canon and provided factual and stylistic influence on subsequent theological and historical works among all linguistic varieties of Christianity, in particular Greek Orthodoxy. Indeed, Eusebius of Caesarea is acknowledged by modern scholars to he responsible for the adjustment of Josephus' mention of Jesus of Nazareth into a Jewish acknowledgement of the latter's legitimacy as the Christ, the true Messiah; this was, no doubt, a serious contribution to the "canonization" of Josephus.

Much of the Jewish literature of the Hellenistic and Roman periods was adopted, with appropriate Christianized interpolation, into the library of the new religion. This literature was excerpted by Eusebius of Caesarea and its fragments survive primarily in his massive two-volume apology against polytheism (*Praeparatio Evangelica*) and polemic against Judaism (*Demonstratio Evangelica*). Other works were incorporated into the canon of the Christian Bible in the 4th century AD which comprised works that, with the exception of the Gospel of St Luke and several letters, were written by practising and believing Jews who had accepted Jesus of Nazareth as the expected Messiah. Even more Jewish material survived as Christian apocrypha. Much of this literature contributed to the Hellenic Church's missionary and didactic policies. Martyrdom, for example, which derived from the Books of the Maccabees, became central to Christianity before Constantine the Great, and later became the ideology for the militant among Christians and Muslims to the present day. The survival of non-canonized material also contributed to the growth of heresy and to the ongoing questions of the nature and arrival of the promised redemption. It also contributed to the prevalence of magic and mysticism within Christian and Jewish Hellenic society during the medieval period.

Jewish influence on Hellenism during the Byzantine period affected the areas of proselytism, diplomacy, and intellectual exchange. Proselytism was one of the primary agents in the expansion of medieval Hellenism's power: it was a formal part of Byzantium's political and diplomatic mission on the one hand to save souls, and on the other, to protect and enhance the empire. Here the Jews served as a foil in the argument against polytheism (particularly among the Slavs whom the Byzantines wished to "Hellenize"); Jews too were subject to more aggressive missionizing, including forced baptism, which became part of Byzantine policy under Herakleios, Leo III, Basil I, Romanos Lekapenos, and John III Vatatzes. During the 10th-century persecutions Hasdai ibn Shaprut, vizier to Abdulrahman III, caliph of Islamic Spain, apparently interceded directly and indirectly with Basil's son Leo and Constantine Porphyrogennetos, the former by letter, the latter by negotiation with the kingdom of the Judaized Khazars to which Byzantine Jewish refugees had fled. The Jewish "mission" to the Turkic tribes, though not planned, was part of the competition between Latins and Greeks for the Volga Turks who moved south of the Danube (eventually these Slavicized Bulgars entered the orbit of Byzantium). The 9th-century apostles to the Slavs, Sts Cyril and Methodios, were from Thessalonica; it was perhaps there that they learned the Hebrew letters which they were to add to the Greek alphabet to form the basis for the Cyrillic alphabet still in use among the Slavic Orthodox peoples. Direct and indirect Jewish influence through translated texts and personal contact is pertinent to the understanding of medieval Slavic and Russian Orthodoxy.

Jews continued to be educated through their own traditions (despite Justinian I's prohibition on teaching the *deuterosis*, the "Jewish tradition") based on a growing body of commentary in Hebrew. This commentary was no less than an encyclopaedia of ancient and contemporary wisdom translated into Hebrew and organized around appropriate verses in the Bible or melded into a running commentary on the Mishnah, a 2nd-century code of Jewish law. Thus ancient and medieval physics were discussed within the context of creation in Genesis, etc. Christian scholars came to study with those scholars who were

able to explain the original Hebrew as well as ancient and contemporary scholarship which was continually being rendered from Greek and Arabic into Hebrew throughout the Middle Ages (and in Sicily and Spain into Latin). Jerome, for example, had conferred with Palestinian rabbis for his Vulgate translation of the Bible, while in the 14th century Simon Atumano, Archbishop of Thebes, produced a polyglot Bible which included a Hebrew version of the Old Testament with contemporary Jewish comments. Greek scholars discussed astronomy and astrology with their contemporaries, and Jews learned from them as well as teaching each other, e.g. the polymath Shabbetai Donnolo of 10th-century Oria (Byzantine Calabria).

The widespread Jewish diaspora in 12th-century Byzantium can be traced in the unique itinerary of Benjamin of Tudela. There he lists communal leaders and population figures for Jews in some 25 Byzantine communities – e.g. Patras, Thebes (2500), Thessalonica (where he apparently mentions only those in the silk industry), Constantinople; his numbers add up to about 9000 which modern scholars differently extrapolate to a total Jewish population between 12,000 and 100,000: perhaps 75,000 is most useful. Jews were widely settled throughout the empire, mainly along the important commercial routes and the major islands where settlements had existed since Hellenistic times as well as in centres such as Mistra, Andravida, Ioannina, Adrianople, Nicaea, Ephesus, and Philadelphia. Heretics, of course, went to the Jews to learn non-Orthodox readings of ancient literature. Scholars such as George Gemistos Plethon (late 14th–15th century) studied with Jewish scholars (in his case, in Ottoman Edirne/Adrianopolis), as did others who followed in his footsteps in Constantinople shortly after the Ottoman conquest. After the rise of Kabbalah (literally "reception", referring to the new stage in Jewish mysticism) after 1200 as the preferred approach to Jewish mysticism, Jewish scholars used this Judaized Neoplatonic system to explore creation in ways beyond the limited inherited approaches of Plato and Aristotle. Indeed, when combined with traditional Jewish speculation, it was apparent that Greek scholars could in no way compete with them, as Shemarya Ikriti (late 13th–14th century) argued. His comment had a long tradition, for as early as the 2nd century AD Numenius the Pythagorean was often quoted for his remark: "For what is Plato, but Moses speaking in Attic?", i.e. whatever wisdom may be found among the Hellenes was already anticipated by the Jews. This apologetic proposition had been argued more fantastically by Artapanus and other Hellenistic Jewish authors since the 2nd century BC.

In addition to scripture, Hellenic Christianity is indebted to Judaism for the architecture of the church, the structure and content of the liturgy, its music and the hymnal, as well as its calendar. The Hellenistic synagogue, a variation on the Greek model, provided the symbols and architectural structure for the churches, at least those not appropriated directly from the polytheists through the sanctification of their temples by 4th-century monks. The iconostasis was originally set up as a protective barrier for the king and high priest Alexander Yannai who was pelted during Sukkoth (Tabernacles) by the followers of the Pharisees on the grounds of his not being of Davidic descent. The tradition of illustrating Bible scenes in fresco and mosaic is also taken partly from early synagogue tradition (e.g. Dura Europus). The liturgy is based, like that of the synagogue, on the ritual of the Temple in Jerusalem with the substitution of Christ for the traditional sacrifice. The Orthodox hymnal is replete with the *kantika* of Romanos the hymnographer who, it has been argued, was a convert from Judaism and brought the hymnal traditions of Nisibis to the Hellenic world to produce some of its most stirring prayers. In turn, the Palestinian Jews, during the persecutions of Justinian, developed the *piyyut* (from *poiesis*), that rendered the oral tradition into poeticized liturgical prayer and thus helped preserve Judaism until the Muslim conquest three generations later. The tradition of Temple music, as investigated by Eric Werner and others, fertilized the medieval synagogue and permeates both Western and Eastern church liturgical music. In the adopted biblical calendar, the Orthodox Easter (Pascha) is the most important holy day; it is the Christian reinterpretation of the Hebrew Pesach (Passover) and occurs on the Sunday following the Hebrew dating of that holiday. Indeed, Justinian tried unsuccessfully to sever by law this dependence which appeared to him as a denigration of Christian dominance over Judaism.

Hellenism moved beyond the Hellenic world during the medieval period into the language cultures of Arabic and Latin, both monotheistic offshoots of Hellenistic culture. While Syriac Christians facilitated the translations from Greek via Syriac to Arabic, Jews proficient in Aramaic and Arabic were able to transfer this newly available knowledge to Hebrew and Latin for the edification of the West. Greek-speaking Jews participated in the project of Frederick II Hohenstaufen, king of Sicily (1198–1250), to translate treatises directly from Greek to Latin. It was in Spain that Neoplatonism was Judaized, partially through the splendid poetry of Solomon ibn Gabirol, and was wedded to the language of the Wisdom of Solomon in the Books of Kings and Chronicles to produce the first stages of Kabbalah. Thirteenth-century developments show interesting parallels to the rise of hesychasm, particularly through the career of Abraham Abulafia. The writings of Maimonides (12th century), in particular his *Guide for the Perplexed*, harnessed Aristotle's logical system for monotheism. From Arabic it was translated first to Hebrew and then to Latin where it became the foundation for Thomas Aquinas to build his great *Summa Theologica*. The latter in turn stimulated an Aristotelian rationalist movement in late Byzantine philosophy.

In the modern period the (re)secularization of Hellenism as the foundation for modern physical and social sciences attracted Jewish scholars such as Baruch Spinoza, Karl Marx, Sigmund Freud, Albert Einstein, and Jacques Derrida. These later developments, however, remove us from the world of the Greek-speaking Hellenists where Greek- and Spanish-speaking Jews continued to live scattered in the towns and villages of the Balkans alongside a polyglot society of Hellenic Christians; just as the Hellenic Orthodox world was overshadowed by the Ottoman conquest, so too the Greek-speaking Romaniote Jews sank to a level of survival during the three centuries prior to 1821. Indeed, the structure and content of the Greek Orthodox diaspora under the Ottomans parallels the vicissitudes of the Jewish diaspora under the Christian Romans (4th to 5th centuries). In the 19th century both Christian and Jewish Hellenes awoke to the French clarion of nationalism which

stimulated ancestral resonances and led to the rebirth of independent Hellenic and Jewish states. At the same time, the regional diasporas of Hellenes and Jews began to collapse, with the survivors withdrawing to the homeland, under Nazi, communist, and Islamic pressures. Their respective diasporas are today further afield, divorced physically from the Mediterranean and surviving, indeed flourishing, under the auspices of the Hellenistic Jewish idea of a monotheistic socioreligious culture.

John I Tzimiskes *c.*925–976

Emperor

John I Tzimiskes (969–76) was one of the more successful military men who seized the throne and continued the territorial expansion of the Byzantine empire during the 10th century. He was born in Chozana, Armenia, and his name is an Armenian rendering of the Greek word *Mouzakites*, meaning "shorty". John enjoyed some notable military successes during the reigns of Constantine VII Porphyrogennetos (913–59) and Romanos II (959–63). In 958, when he was the *strategos* (supreme commander) of Mesopotamia, he captured the cities of Dara and Samosata, as well as inflicting two defeats on the talented Hamdanid general Sayf al-Dawlah, sending the captives to be paraded through Constantinople. In 962 he commanded a wing of the army led by Nikephoros Phokas into Cilicia. Later he assisted in the capture of Aleppo. After the death of Romanos II (963) John, who was then *strategos* of the Anatolika and the empire's second most famous general, decided to support Nikephoros Phokas in his bid for power. As a reward for his support, Nikephoros made John *domestikos* (commander) of the east. Subsequently John defeated the Arabs near Adana in 964. Later, in 969, Nikephoros would earn John's resentment by transferring the control of eastern operations to Peter the Stratopedarch. John had important dynastic connections of his own: his mother was the sister of Nikephoros Phokas and his first wife Maria was the sister of Bardas Skleros. He was also a grandson of Bardas Phokas and related to John Kourkouas. He eventually came to power as a result of a military coup against the emperor with the cooperation of Nikephoros's wife Theophano, who was also John's lover. Theophano was the former wife of Romanos II and mother and regent of the future emperors Basil II (976–1025) and Constantine VIII (1025–28). Nikephoros was assassinated in 969 while sleeping on the floor of his bedroom in front of his icons. The patriarch Polyeuktos refused to sanction John's coronation unless he did penance for the murder. Among the patriarch's preconditions was that John should send Theophano away. He complied and later married Theodora, the daughter of Constantine VII and aunt of the legitimate emperors Basil II and Constantine VIII.

John waged war successfully on multiple fronts. He won a spectacular victory over Svjatoslav, the Russian prince of Kiev, in Bulgaria. After repulsing Svjatoslav's initial assault, he captured the Bulgarian capital of Preslav, which he renamed Joannopolis after himself, and freed the imprisoned Bulgarian emperor Boris. He later surrounded the main Russian army at Dristra and, after a three-month siege, forced it to capitulate. He renamed the town Theodoropolis after St Theodore Stratelates, who purportedly assisted the Byzantines during the siege. Later he forced Boris to abdicate and annexed most of Bulgaria, organizing it into six new themes. In addition, he demoted the Bulgarian patriarchate to an archbishopric and placed it under the control of Constantinople. John also made

an alliance with the German emperor, Otto I, by agreeing to marry his niece Theophano to Otto's son, the future Otto II, in 972. With the conclusion of these arrangements in the west, John was able to focus his attention on extending the eastern frontiers of the empire. In 972 he captured and destroyed Nisibis. In 974 he returned to the east, imposing tributary status upon the emir of Mosul. In 975 John led his forces against the Fatimid Caliphate by campaigning in Syria. He was successful in forcing Damascus to pay tribute and later captured Beirut. He reportedly planned to continue campaigning in the east, hoping eventually to recapture Tripoli and Jerusalem.

In addition to his military achievements, John also passed some legislation concerning the alienation of soldiers' land to the control of the *dynatoi* (notables) and the monasteries. He was pressured to repeal Nikephoros Phokas's legislation, which had not only forbidden future donations of land to the monasteries but also banned the establishment of new ones. John had a standing policy that required local theme officials to investigate the estates of local magnates and monasteries. Any peasants found on these estates who were previously under obligation to the state were to be returned to state control. Like previous emperors, John recognized the need for maintaining the pool of smallholders who formed the basis for military recruiting; however, he also allowed some peasants to remain under the control of the monasteries. In 976 a rumour arose that John was planning to investigate the estates owned by the grand chamberlain Basil Lekapenos in Cilicia, whose property was made up of lands previously belonging to the state. Basil supposedly had the emperor poisoned to prevent this. John died in Constantinople on 10 January 976, most likely a victim of typhoid.

JOHN F. SHEAN

Biography

Born *c.*925 at Chozana in Armenia, John was a most successful general. After the death of Romanos II in 963 he supported Nikephoros Phokas as emperor and in return was made *domestikos* of the east. But in 969 Nikephoros transferred the command and John took his revenge by murdering the emperor. Seizing the throne for himself, John continued to expand the territory of the empire. He died in Constantinople in 976.

John II Komnenos 1087–1143

Emperor

John Komnenos (1118–43) was the eldest son of Alexios I Komnenos (1081–1118). Because of the prejudices of our few extant written sources we know virtually nothing of his activities before 1118, and only slightly more thereafter. He became heir to the throne in 1092 when Alexios's victory over the Pechenegs – a fierce nomadic people who had settled within the northern Balkans – allowed him to disinherit the *porphyrogennetos* ("born to the purple") Constantine Doukas. Doukas had been betrothed to John's sister, Anna Komnene, who had therefore expected to succeed to the throne. John's promotion provoked a bitter rivalry between the siblings, and ultimately led to an attempt by Anna to prevent her brother's accession in 1118. Her coup, in which her mother Irene Doukaina was also involved, failed, and Anna was banished to a nunnery, where she later wrote her *Alexiad*, the history of her father's reign. John is systematically eliminated from her text: Anna mentions her brother only five times, each time with disdain or hostility. Finally she opines: "We enjoyed peace until the end of [Alexios's] life, but with him all the benefits disappeared and his efforts came to nothing through the stupidity of those who inherited the throne."

A fuller, although far from complete, picture of John's reign is painted by the two principal historians of the 12th century, John Kinnamos and Niketas Choniates. From these we learn that John entrusted military commands to relatives, the *sevastoi*, but put civil affairs into the hands of more obscure men, such as John of Poutze, who centralized the administration of the army and navy, commuting service for cash payments in maritime districts. John took personal command of the imperial forces, and campaigned extensively in Anatolia and lands further east, capitalizing on his father's successes. He fought wars against the Danishmendids and captured the strongholds of Kastamon and Gangra after 1134. He restored Byzantine authority in Cilicia in 1137, and in the following year accepted the homage of Raymond of Poitiers, the ruler of Antioch. His subsequent drive into Syria ended with an unsuccessful assault on Aleppo. In the west John was more circumspect, campaigning against northern nomads (probably Cumans) in 1122, and twice against the Hungarians between 1127 and 1129. For most of the 1130s John was allied with the German rulers Lothar III (1125–37) and Conrad III (1138–52). In 1136 Byzantine troops took part in Lothar's campaign, which pressed into Norman-occupied southern Italy as far as Bari. Relations with Conrad were even better, and from 1140 were destined to be cemented by the marriage of John's fourth son, Manuel, to Conrad's sister-in-law, Bertha of Sulzbach. Thus, John was free to concentrate his attention and resources on his eastern campaigns, and it was in Cilicia in 1143 that he was killed in a hunting accident. By then two of his two eldest sons, Alexios and Andronikos, had also died, and the succession was disputed by the two younger sons: Isaac, who had returned to Constantinople, and Manuel, who had been with his father and thus in command of the imperial army. Manuel succeeded.

Although we can extract reliable facts for John's reign from the histories of Kinnamos and Choniates, both authors were more concerned with subsequent events. Both treat John's reign as a mirror that reflects the deeds of his son and heir Manuel I Komnenos, and both have clear and clearly opposed agendas. Kinnamos, Manuel's personal secretary, invites his audience to compare Manuel's actions, his personal valour and achievements, with those of his father; they are expected to recognize the author's innuendo, and conclude with him that the son is greater than the father. Choniates, writing after

John II Komnenos: mosaic (*c.*1118) in Hagia Sophia showing the Virgin and Child standing between the emperor John II Komnenos and his wife, the empress Irene

1204, identifies the roots of the cataclysm in Manuel's reign, highlighting his "Latinophilia", and invites his readers to contrast this with the solid and measured successes achieved by John in the east. Perhaps the best example of the two approaches to John is contained in the contrary accounts of his campaigns against Hungary in the years 1127–29. Although they are fairly insignificant within the context of John's 25-year reign, both authors devote disproportionate space to these exchanges. The reason for this would have been more obvious to contemporaries, who were familiar with Manuel's greatly lauded campaigns against Hungary, than it is to modern readers, who are similarly invited to compare and contrast these with John's limited achievements.

There are a few contemporary accounts of John's activities from which we can glean further information, although they are far from objective: his reign witnessed a flowering of court panegyric, which appears to have complemented the revival of the imperial triumphal procession in 1133. Theodore Prodromos wrote at least 22 verse encomia in honour of John, 11 of which were concerned with the emperor's departure for, or return from, campaign. The glorification of warfare is central to the construction of John's imperial image, and Prodromos celebrates John's qualities as a commander, the spilling of blood and sweat, the vision of the just war of reconquest, and the predicted extension of the emperor's dominion to the ends of the earth. Other striking images of John's imperial style have survived as enduring beacons in the general obscurity. A famous mosaic in Hagia Sophia in Constantinople portrays the emperor with his Hungarian wife, Piroska-Irene (to whom he was married in 1105), flanking the Virgin with infant Christ. To Piroska's left stands the figure of John's eldest son, Alexios, who was to succeed. John and Alexios are also portrayed together in John's illuminated copy of the Gospels, standing beneath the enthroned Christ who bestows their crowns. The faces of the emperor and his son differ from all others in the manuscript, suggesting an attempt by the artist to capture their actual appearance. A third powerful image of John's sovereignty is his roundel, now in the Byzantine collection at Dumbarton Oaks, Washington, D.C. John was buried, with his wife, in the Pantokrator monastery in Constantinople, his own monastic complex, for which the foundation charter (typikon), dated October 1136, survives. The three parallel church buildings stand today, with the Turkish name Zerek Kilise Camii.

John III Vatatzes *c.*1192–1254

Emperor of Nicaea

The emperor John III Doukas Vatatzes (1222–54) consolidated the power of the Byzantine empire in Nicaean exile and laid the groundwork for the reconquest of Constantinople in 1261. He inherited the throne as the son-in-law of the first Laskarid emperor of Nicaea, Theodore I Laskaris (1204–22). John III Vatatzes seized every opportunity to expand the boundaries of the Nicaean state and to tighten the loop around the Latin-held Constantinople. He preferred diplomacy to war, but when necessary he proved to be a talented military commander. In 1224 he defeated the Latins at Poimanenon in Bithynia, depriving them of all their possessions in Asia Minor. His initial advance in the Balkans was impeded by the expansion of the despotate of Epirus. In 1224 the ruler of Epirus, Theodore Komnenos Doukas (*c.*1215–30), seized Thessalonica from the Latins and had himself crowned emperor of the Romans. In the following year he expelled the Nicaean garrison from Adrianople and seemed poised to recapture Constantinople. The ambitions of the Epirot ruler were, however, thwarted by the Bulgarian king Ivan II Asen (1217–41), who defeated him in a pitched battle in 1230 and took him prisoner. Thrace and Macedonia soon fell into Bulgarian hands.

John III Vatatzes managed, however, to benefit from a Nicaean-Bulgarian alliance in 1235 that allowed him to establish a permanent European foothold in southern Thrace. Having stabilized his eastern frontier in the period 1225–31, he launched an attack on Constantinople in 1235/36 together with the Bulgarian forces of Ivan II Asen. The Greek-Bulgarian siege of Constantinople failed, however, since the Bulgarian king withdrew from the alliance at the last moment, realizing that the Nicaean state was a more dangerous enemy that the enfeebled Latin empire. After Ivan II Asen's death, John III Vatatzes took advantage of the preoccupation of Bulgaria with the Mongol threat and conquered Macedonia easily in 1246. In the same year he entered Thessalonica victoriously and put in prison its last ruler Demetrios Komnenos Doukas (1244–46), Theodore Komnenos Doukas's son. He did not manage to subjugate Epirus, which was now under the rule of the energetic despot Michael II (*c.*1237–71), Theodore Komnenos Doukas's nephew. Michael II was forced in 1252 to surrender to John III the cities of Servia in Thessaly and Durazzo in Albania. A marriage alliance between the rulers of Nicaea and Epirus in 1254 failed to cement the unity between the two Greek splinter states. Epirus was to remain an independent principality until 1340, when it reverted briefly to Byzantine control.

John III Vatatzes maintained friendly relations with various western powers in a diplomatic effort to weaken the Latin empire. In 1237 he concluded an alliance with the Holy Roman emperor Frederick II Barbarossa. After the death of his wife Irene Laskaris, he married, around 1244, Frederick's daughter Constance (Anna). When this alliance failed to bring concrete results, he entered in 1248 into negotiations for union with the Roman Church. He went so far in his concessions as to suggest a recognition of the papal primacy should Rome withdraw its support from the Latin empire.

John III Vatatzes was extremely popular among his subjects and after his death he was honoured as a saint in the churches of Magnesia, where he died, and Nymphaion, where he often resided. In the early 14th century, during the reign of Andronikos II (1282–1328), the inhabitants of Magnesia and other neighbouring cities invoked his name to help them against the advancing Turks in Asia Minor. This posthumous reputation seems to be grounded in the emperor's social policies. He supported the small peasant holders against the landed aristocracy and rebuked the nobility for its luxurious expenditure. He himself encouraged the elimination of luxury items from the imperial court. The historian Nikephoros Gregoras relates the story of how John III Vatatzes used the revenue of his private poultry farm to buy a crown for his wife Irene Laskaris adorned with pearls and precious stones; he called it the "egg-crown". John was one of the few late Byzantine emperors to protect local craftsmanship and manufacturing, cloth production in particular. He issued a special law forbidding the purchase of luxury goods and other articles that were imported from the west. This legislation was directed primarily against the Venetians and the Genoese, who obtained no commercial privileges in Nicaea during his reign. When he died on 4 November 1254, he left Nicaea a vigorous and prosperous state with a territory that had doubled in size since the beginning of his rule. The recapture of Constantinople, however, had to wait until 1261.

John Vatatzes' official canonization by the Orthodox Church took place during the second half of the 17th century. His memory is still observed on 4 November and he is known as St John the Almsgiver. In the last quarter of the 14th century the bishop of Pelagonia George wrote a *Life* of him. A 17th-century vernacular version of the saint's life exists as well.

DIMITER G. ANGELOV

Biography

Born *c.*1192, John married Irene, daughter of the emperor Theodore I Laskaris, and in 1222 inherited the throne from his father-in-law. He defeated the Latins at the battle of Poimanenon in 1224, driving them out of Asia Minor, and advanced into the Balkans. He doubled the size of the Nicaean empire and left it poised to recover Constantinople. He died at Magnesia in 1254 and was canonized in the 17th century.

John VI Kantakouzenos *c.*1295–1383

Emperor

Descended from an important family of wealthy warrior-nobles, John Kantakouzenos (1341–54) was born in or around 1295, apparently after his father's early death. He was brought up by his mother Theodora, a woman of great ability and character who had family connections with the reigning house of Palaiologos.

By 1320 John was married to Eirene Asenina, an intelligent and spirited woman of Bulgarian and Palaiologan ancestry, whose energy and decisiveness strongly influenced her husband. By this time, too, he was associated with the restless and ambitious prince Andronikos Palaiologos, grandson of the reigning Andronikos II (1282–1328). He used his position and wealth in support of the younger Andronikos's ambitions during the intermittent civil war (1321–27) that replaced the elder emperor with his grandson as Andronikos III (1325/28–1341).

Holding the title of Grand Domestic (*Megas Domestikos*), Kantakouzenos, an able general, became the chief adviser and right-hand man of the new emperor who, at one point of mortal danger, even proposed that he become co-ruler. When Andronikos III died (15 June 1341), leaving behind as heir a 9-year-old son, John V Palaiologos, by his Latin wife Anna of Savoy, Kantakouzenos again resisted suggestions that he assume the imperial title himself, content to be virtual regent for the legitimate dynastic successor. But his erstwhile allies and colleagues – above all the ruthless Alexios Apokavkos – jealously conspired against him while he was out of the capital. Winning the support of the gullible Anna, they seized the government, arrested members of Kantakouzenos's family, and stripped him of office. Reluctant to respond too drastically, Kantakouzenos finally accepted the advice of his wife and advisers and proclaimed himself emperor (26 October 1341), though he scrupulously recognized the legitimate rights of Anna and her son as taking precedence.

Despite his wealth and the support of many other wealthy nobles, Kantakouzenos's position was initially weak, and social tensions prompted violent populist reactions against him as a symbol of the hated elite, particularly bitter ones developing in Thessalonica. In desperation, Kantakouzenos sought help from Stephan Dushan of Serbia and from Turkish princes – first the emir Umur Beg of Aydin, and then the Ottoman emir Orhan. As a result, Kantakouzenos has been condemned for introducing such dangerously ambitious outsiders into the Byzantine scene. In fact, both sides in the conflict cultivated such alliances, which rendered a weakened Byzantium vastly more vulnerable to its neighbours. Kantakouzenos's progress was furthered by the murder of Apokavkos (11 June 1345), who had maintained control of Constantinople. The usurper eventually felt sufficiently strong to stage a formal coronation at Adrianople (21 May 1346), though still affirming his commitment to John V's rights. The following February, Kantakouzenos secured entry into the capital, and arranged a settlement by which his claim to co-sovereignty was accepted and his daughter Helena was married to John V.

Kantakouzenos further solidified his family's position by sending his second son, Manuel, to rule the Byzantine Morea with the title of despot. He managed to suppress the separatist regime in Thessalonica (1350). Above all, he made every effort to restore the empire's frayed boundaries, to stimulate economic recovery (often paying state expenses out of his own wealth), and to bring peace to the Byzantine Church that was torn over the controversial religious doctrines of hesychasm. But the terrible Black Death (1347–48) debilitated the Byzantine world, while the deepened weakness of Byzantium was displayed when Kantakouzenos was caught between the rival powers of Genoa and Venice during their so-called Galata War (1350–52), fought partly in Byzantine waters, at Byzantine cost.

Mounting internal problems, and an inability to cope with increasing Turkish invasions, served to discredit Kantakouzenos's earnest efforts, at a time when John V, increasingly dissatisfied with his status, became restless and threatened new rounds of civil war. Though still reluctant, Kantakouzenos finally retaliated by allowing the coronation (April 1353) of his own eldest son, Matthew Kantakouzenos, as his new co-emperor – a step he had long tried to avoid. Matters came to a head when John V effected entry into Constantinople (November 1354). A series of agreements aimed at accommodating a continued double sovereignty led to Kantakouzenos's decision to abdicate (10 December 1354).

He remained active over the next few years, arranging terms for the dethroned Matthew and for Manuel's continuance in the Morea. Meanwhile Kantakouzenos – and his wife as well – took monastic orders, assuming the name of Joasaph, but still enjoying the honorary title of emperor. While he devoted much of his time to literary activity in semi-retirement, he was nevertheless still active in public life. His daughter remained as John V's empress, his friends were restored to influence at court, and he himself was retained as a trusted adviser by his weak and shallow son-in-law. He was acknowledged as one of the important people at court: some finding him even more powerful now than when he had been emperor on his own. On a number of occasions he wrote or made official appearances, in effect as acting emperor – as in June 1367 when he presided over a discussion with a papal legate over the possibilities of a reunion of the Churches of Rome and Constantinople. John was recurrently involved with this question, which he took very seriously, though insisting upon the rights and integrity of the Orthodox position.

Kantakouzenos was in Constantinople when his grandson Andronikos IV, the selfish eldest son of John V, imprisoned his father and brothers and attempted a government of his own (1376–79). When this regime collapsed, Andronikos fled to his Genoese allies in Galata, taking his grandfather Kantakouzenos and his mother Helena with him as hostages. Upon their release, the weary ex-emperor decided to withdraw from the capital and settle in the family territories of the Morea at Mistra, joining his son Matthew (who had replaced

the deceased Manuel). There Kantakouzenos died (15 June 1383) at the age of 88.

Even in its decay, Byzantium could still produce able and dedicated leaders, and Kantakouzenos stands out as one of the last two really great ones, together with his true heir, his grandson Manuel II Palaiologos (emperor 1391–1425). Kantakouzenos's talents certainly qualified him for the throne, but his and his realm's tragedy was that he had to compensate for lack of legitimate claim by recourse to usurpation, at the price of a ruinous civil war that invalidated much of the good work he might do. If his ambition may be condemned, his hesitation must be recognized, the provocations he suffered may be acknowledged, and his scruples should be respected.

Both as patron and as contributor, Kantakouzenos played an important role in Byzantium's late intellectual life. Interested in the thought of western Christendom, he supported Demetrios Kydones and other scholars in their exploration of the works of Thomas Aquinas and other Latin theologians, previously unknown in Byzantium. But he parted company with them in remaining staunchly loyal to the traditions of Orthodoxy, whose rights he upheld without compromise against Latin claims. During his monastic years, he himself composed a number of theological treatises, in which he argued against the beliefs of Islam and of Judaism, as well as on behalf of the ideas of his friend and supporter, the brilliant theologian Gregory Palamas. His literary masterpiece is his *History* of his era, a memoir of apologetics for his usurpation, but a serious and unusually lucid work that is one of the finest examples of Byzantine historical writing.

John Kantakouzenos saw his place as clearly in the tradition of "Roman" sovereignty that extended back some 14 centuries, but as inseparably linked with the spiritual dimension of Greek Orthodox faith. It is thus appropriate that, of the surviving portraits we have of him, the two finest by far show him, respectively, as ruling emperor presiding over a church synod (Paris, Bibliotèque Nationale cod. gr. 1242, f.5), and in a double portrait, on one side as reigning emperor and on the other as the aged monk Joasaph (f.123 of the same manuscript).

JOHN W. BARKER

See also Kantakouzenos family

Biography

Born *c.*1295, John Kantakouzenos was the (probably posthumous) son of a Peloponnesian aristocrat. He became the friend and chief adviser of the emperor Andronikos III, after whose death in 1341 Kantakouzenos acted as regent for the legitimate emperor John V Palaiologos, becoming co-emperor with him later that year. Crowned in Adrianople in 1346 and in Constantinople in 1347, Kantakouzenos reigned until 1354 when he abdicated and became a monk, though he remained an adviser at court for another 25 years. He died at Mistra in 1383.

John VIII Palaiologos 1392–1448

Emperor

Born in mid-December (16, 17, or 18) 1392, John was the first of the surviving six sons of the emperor Manuel II Palaiologos (1391–1425) and the Serbian princess Helena Dragaš. He was groomed from the outset as his father's heir, who addressed to him several literary works of regal admonition. Manuel betrothed him to a princess from Moscow (1411), whom John married in 1414 when he was 22 and she was about 11. John served as regent for his father during Manuel's sojourn in the Morea (1415–16), after which John was sent in his own turn (1416–18) to assist his younger brother, despot Theodore II, in expanding Byzantine control in the Peloponnese at Latin expense, and to gain military experience in the process.

When he returned to Constantinople, John found that his child-bride had died, leaving him available for a second diplomatic marriage. This his father arranged with Sophia of Montferrat, member of a Latin family with which the

John VIII Palaiologos, a bronze medal commemorating the emperor's visit to Italy in 1438–39

Palaiologan dynasty had long-standing contacts. This new marriage was a personal failure: John found Sophia repulsive and avoided her. But their wedding (19 January 1421) also served as the occasion for the ageing Manuel to crown his heir as co-emperor.

By then aged 28, John had become restless and he apparently led a court faction that advocated an activist policy more directly hostile to the Turks than Manuel's careful conciliation had been. Manuel yielded initiative to him and, when the benevolent sultan Mehmet I died later that year, John attempted to intervene in the Turkish succession. This brought down the wrath of the actual heir, sultan Murad II, in the form of sharp military reprisals and a formidable siege of Constantinople in the summer of 1422. The siege was soon abandoned, thanks to the diplomatic machinations of Manuel, who resumed leadership, only to suffer a paralysing stroke (1 October). John assumed direction of the government thereafter. Leaving his younger brother Constantine as his regent, he undertook (November 1422–November 1423) his first journey to the West, in hopes of securing aid from Venice and Sigismund of Hungary. The venture was a failure, however, and in his absence Constantine negotiated a disadvantageous but much-needed peace with the Turks.

The old emperor Manuel died on or around 21 July 1425, leaving John full title to the Byzantine crown. The following year his hapless wife, Sophia of Montferrat, managed (or was allowed, or pressured) to flee westward. Securing a welcome annulment of the marriage, John proceeded (September 1427) to take as his third wife the love of his life, the beautiful princess Maria Komnene, daughter of the Greek emperor of Trebizond. Shortly after, he departed to spend about a year (1427–28) in the Peloponnese, joining his brothers in further conflicts with the local Latin regime and beginning an arrangement for their sharing of rule in the Byzantine Morea.

The withered Byzantine empire was now completely dependent upon the Turks. Murad II spent most of his reign (1421–51) rounding out territorial conquests generally in the Balkans. In 1423 the Byzantine government had sanctioned the transfer to the Venetian Republic of the important city of Thessalonica, which the Byzantines could no longer defend, and in 1430 Murad's forces took it by storm. Otherwise, Turkish policy bided its time with regard to Constantinople. This relative repose allowed John to renew efforts to seek western aid in order to save what was left of Byzantium from a final onslaught that would be inevitable sooner or later. His father had sought such aid, offering talk of Church union with Rome even while realizing that such a controversial step would be too dangerous to pursue in earnest. By contrast, John seems genuinely to have believed in the cause of union, partly because he had more confidence than his father in its viability, but also because he shared with other Byzantines of his day at least some sense of shame at the mere idea of schism among good Christians.

Accordingly, while doing his best to keep his unruly brothers in line, John began negotiations with the papacy. John would allow no abject submission of Constantinople to Rome, but insisted upon the holding of a full-dress Church Council that the Orthodox could regard as Ecumenical and authoritative, and where issues of difference could be fully debated. For a while, John also conducted parallel negotiations with the Council of Basel, the reformist gathering then attempting to challenge papal authority. But, eventually, John agreed upon terms with pope Eugenius IV and, in November 1437, set out for Italy with his patriarch and a large retinue of Greek clerics, advisers, and courtiers (among them, the philosopher George Gemistos Plethon). The council opened (January–February 1438) in Ferrara, but was transferred (January 1439) to Florence, where the Greek delegation prompted much excitement among artists and intellectuals. Though plagued by ill health, and often distracted by his passion for hunting, John led the Byzantine delegation responsibly, respecting dissident opinions while working for compromises that would achieve union with minimal Byzantine humiliation. The union formula was finally achieved, and the decree, signed by the Greeks on 5 July 1439, was proclaimed in Florence Cathedral the following day.

Certainly aware of the problems in persuading his people to accept the controversial union, John did not return to Constantinople until the following February, where only his respected mother could dare give him the news that his beloved wife, Maria, had died six weeks earlier. The emotional blow is often taken to explain John's failure to pursue actively the official implementation of union at home. But John also faced bitter opposition from clerical and popular circles that made him temporize. At the same time, he had to deal with more squabbling among his younger brothers, and even an outright attack upon him by one of them, Demetrios (1422), who played upon anti-unionist sentiments. Above all, John's hopes for serious western aid which had been promised to Byzantium as the reward for union, were dashed when a formidable crusade army was crushed by the Turks at Varna (10 November 1444), and a supplemental effort under John

Hunyadi of Hungary was smashed soon after (17 October 1448). Worn out and disillusioned, John died on 31 October 1448, not yet 56. The vindictive clergy denied him proper funerary rites at his interment. Childless, he was followed on the throne by his favourite brother, Constantine, who was left to face Byzantium's terminal disaster at the fall of Constantinople (1453).

Though there are suggestions of early intellectual interests, John was neither brilliant in intellect nor clever in statesmanship. Less noble and sophisticated than his father, he was nevertheless earnest and dutiful, perhaps eventually tragic. At a time when "Hellenic" identity was caught between the faded "Roman" tradition of Byzantium and the beleaguered spiritual integrity of Orthodoxy, he tried dutifully if imprudently to serve each and reconcile both. Of slight stature and eventually somewhat crippled, John was highly sensitive to ceremonial and to the prerogatives of his rank. While not handsome, he bore himself well and made a strong impression, as suggested in surviving artistic representations of him, including Byzantine family portraits and, especially, western characterizations. Like his father during the latter's own European journey, John captured the fascination of western artists, who either portrayed him directly (Pisanello, Filarete) or took him as an idealized model for biblical, Roman, or eastern sovereign types (Benozzo Gozzoli, Piero della Francesca).

JOHN W. BARKER

Biography

Born in 1392 the eldest son of emperor Manuel II, John was crowned co-emperor with his father in 1421. John had some military success in the Peloponnese but in 1423 Thessalonica was transferred to Venice and in 1430 it fell to the Turks. A keen advocate of church union with Rome, John led the Byzanrine delegation to the Council of Ferrara-Florence in 1438–39. The reward for union was to be military aid but the crusading army was defeated by the Turks at Varna in 1444. John died at Constantinople in 1448.

John Chrysostom, St *c.*347–407

Archbishop of Constantinople

John was the most renowned preacher in the history of the Greek Orthodox Church – hence his posthumous epithet, Chrysostom ("golden mouth"). He was also the most prolific writer among the early Church Fathers, filling 18 volumes of Migne's *Patrologia Graeca*. His approach to exegesis, learned under Diodorus of Tarsus, followed the literalist Antiochene school rather than the allegorical interpretations of Origen and the Alexandrian scholars.

His career in the Church – in Antioch until 398, then as archbishop of Constantinople – was honed by a decade of desert asceticism (*c.*370–80). Most of John's extant homilies, more than 700, date from his Antioch period. His sermons include the well-known series *On the Statues*, delivered in 387 to calm the fears of the Antiochenes who had destroyed the statues of emperor Theodosius I and his beloved wife during a riot. During this time he also produced significant treatises: in defence of monasticism, *On Virginity*, and his patristic masterpiece *De Sacerdotio*, on the dignity of the priesthood.

In 398 Chrysostom's oratorical reputation made him the choice to succeed Nectarius as archbishop of Constantinople. One of his first acts was to sell Nectarius' rich furnishings, using the revenues to set up hospitals and charities for the poor. As in Antioch, his sermons made him popular among his congregations. But his episcopacy was tragic. In his desire to reform the morals of the capital, he made an enemy of empress Eudoxia, whose lavish lifestyle he castigated from the pulpit. Again, observing the worldliness and laxity of his own clergy, he began a programme of unwelcome reform. Among other things, they were no longer permitted to reside with lay sisters (*subintroductae*) in spiritual, unmarried, and celibate intimacy.

In 401, during a three-month tour of the churches of Asia Minor, John presided over the election of a new bishop of Ephesus and removed six bishops for simony. His actions, however, were of questionable validity in the eyes of his episcopal victims – now enemies – since Heraclea, not Constantinople, was still the seat of the metropolitan of Asia Minor. The door was open to accusations of impropriety against John himself.

When John returned to Constantinople, his relationship with the empress had changed. A tactless reference in a sermon to Eudoxia as Jezebel had proved his undoing. In 403 an occasion for ruining him presented itself: he had sheltered four Egyptian monks exiled for Origenism, and so now he himself underwent trial for alleged Origenist leanings. Urged on by Eudoxia, bishop Theophilus of Alexandria convened the court at Chalcedon (Synod of the Oak), outside John's jurisdiction. The most serious of the charges was his comparing the empress to Jezebel, which was twisted into a charge of inciting the populace to rebellion. John was deposed and sentenced to lifelong exile. However, intimidated by threats of a popular uprising and frightened by an earthquake in the city, Eudoxia urged her husband Arcadius to revoke his sentence. But his triumphal return was temporary: the friendship of Eudoxia did not last.

Later in 403, a monument to Eudoxia was erected near the old Hagia Sophia cathedral. Its boisterous dedication lasted days and disrupted church services. When John called upon the

St John Chrysostom, whose many surviving works have ensured that he is as highly regarded by the western Church as by the eastern

city prefect to disperse the crowds, Eudoxia took it as a personal affront. On the feast of the beheading of John the Baptist, John is reported to have made yet another rash comparison: "Again Herodias dances; again she seeks the head of John." This time John's enemies had a new weapon: two canons of a council of Antioch (341) stating that a deposed bishop reinstated by a secular government should be permanently unseated.

On Holy Saturday in 404 John defied an imperial order of house arrest to baptize personally some 3,000 catechumens he had instructed that year. During the solemn service imperial troops dragged the half-dressed catechumens from the cathedral, injuring many. The capital was as if in a state of siege during Easter week. John's supporters, the Joannites, were imprisoned and tortured. In June John was carried away by boat to exile in Asia, and soon afterwards Hagia Sophia and the neighbouring buildings were destroyed by fire, inaugurating new persecutions of suspected Joannites. John wrote letters to Arcadius' brother Honorius, who was ruling in Ravenna, and to pope Innocent I, and both wrote futile appeals to Arcadius.

John's place of exile was Cucusus in southeastern Turkey, "the most abandoned spot in the world". We have his own report of the difficult journey in his numerous extant letters, all belonging to his period of exile. Chronic fever often nearly finished him, and bandits were a constant threat. When he finally arrived in Cucusus, he found the bishop willing to serve him. Old friends from Antioch visited him, and he corresponded vigorously with them, with supporters in the capital, and with several bishops. His letters dealt with matters of discipline and addressed Arianism and the practices of Jewish converts to Christianity who were still attending synagogue. Meanwhile, he cared for the poor in the region and, in short, performed nearly all of his former episcopal functions. Among the hundred-or-so recipients of his 240 letters, his intimate friend, the deaconess Olympias, received 17, in which John poured forth his deepest self.

Even after the death of Eudoxia in 406, John's enemies sought to harass him to death. Arcadius ordered him moved by forced march to Pityus on the northeastern shore of the Black Sea. On the way, on 14 September 407, John died; he was only 60. In 438 his body was moved to the church of the Holy Apostles in Constantinople by Theodosius II and his sister Pulcheria. Theodoret is the source that this Theodosius, son of Eudoxia, prayed over the body of John Chrysostom to intercede for the sins of his parents. John's biography had already been written by a contemporary, Palladius, and by historians of the 5th century, who first used the surname Chrysostom and exalted his character and life's work.

John's lasting influence over doctrine is subtle. His homilies took a common-sense literal approach to biblical texts and from them drew lessons for practical life and morality. He believed overly in free will; but, he urged, when man freely chooses the good, God provides the grace to carry his intentions through. The relative lack of interest of the Orthodox Church in the issue of grace may therefore be attributed to John.

He taught that Christ was both divine and human, son of Mary perpetually virgin. He was a powerful advocate of the Real Presence in the Eucharist. In his Homily 24 on 1 Corinthians ("The wise men adored Christ in the manger; we see him not in the manger, but on the altar"), John is often credited as a distant source for the Melismos Eucharistic service in which the celebrant cuts the eucharistic bread through a cloth image of the infant Jesus placed over it, visually identifying the child as changing into the crucified victim. The liturgy associated with his name is still in use in the Greek and Russian Churches. Finally, though he seems not to have acknowledged the primacy of Rome, John Chrysostom stood for the moral authority of altar over throne.

DANIEL C. SCAVONE

Biography

Born in Antioch *c.*347, John was a pupil of Libanius and Diodorus of Tarsus. He became a monk and spent a decade as a desert ascetic. Returning to Antioch in 380, he was ordained a deacon and a priest and gained a reputation as a preacher. Some 700 of his sermons survive. In 398 he was chosen to be archbishop of Constantinople. After differences with the empress he was deposed in 403, briefly recalled, and banished in 404. He died in exile in 407. He is the patron saint of preachers.

John of Damascus, St

Monk and theologian of the 7th/8th centuries

There is no clear evidence for the date of John Damascene's birth: estimates range from 650 to 675. He was born in Damascus, to a family that had retained its commanding role in the fiscal administration of the area throughout the political changes of the 7th century. John seems to have succeeded his father, and served under the Umayyad caliph in Damascus. In preparation for this, he received a good Classical education, as is evident from his writings. At some stage, perhaps in the second decade of the 8th century, he left the administrative service and became a monk in the vicinity of Jerusalem, by tradition (only late-attested) at the monastery of Mar Saba, the "Great Lavra". There he devoted himself to his monastic vocation, attained some fame as a preacher, and composed many literary works, both works of theology and liturgical compositions. He died sometime before 754. John is ranked as one of the four great hymnographers of the Orthodox Church.

His importance for the Hellenic tradition lies in his being the greatest representative of the process in which the Byzantine Christian identity was formed. This is at first sight surprising, for John was never a Byzantine subject, and apparently never set foot on territory ruled by the Byzantine emperor (the account in the late *Life* of his visit to Constantinople is certainly legendary). With the collapse of Byzantine rule in the eastern provinces, including Palestine, in the 7th century before the Arab advance, Christians who had supported the Christian orthodoxy of the emperors and the Councils found themselves in a situation, deprived of political support, where many of their neighbours rejected their interpretation of Christianity, or even Christianity at all. So for most of the 7th century they had to define and defend their understanding of orthodoxy against the heresies of Monophysitism and Nestorianism, popular in the east, against Jews and Samaritans, against what the monks of Palestine in particular regarded as the new imperial heresies of Monenergism and Monothelitism, and eventually against triumphant Islam. This led to a good deal of polemical literature, and attention to matters of logic and the definition of the quite complex terms in which Christological orthodoxy had come to be expressed, as well as to patristic support for their position, for the orthodox had now to convince by the force of their arguments, no longer being able to rely on the secular arm. Hitherto conciliar orthodoxy had had many supporters in Palestine, especially among the monks: it was these whom John joined. John's works thus reflect the fruits of nearly a century of reflection on the nature of orthodoxy, refined in the crucible of political defeat.

John's principal prose work is his *Fount of Knowledge*, which in its final form probably belongs to the last decade of his life, though it is clearly the work of several decades' labour. It is in three parts: *Dialectica*, *On Heresies*, and *On the Orthodox Faith*. The first part is a fruit of the concern for cogent argument, and consists of definitions of logical and metaphysical terms, drawn mostly from 6th-century Alexandrian logical commentaries. The second part, consisting of 100 chapters, reproduces an epitome of Epiphanius of Salamis's *Panarion*, followed by chapters on later heresies drawn from other sources, closing with an account, composed by John himself, on the latest heresy, as he saw it – Islam. The third part, also consisting of 100 chapters, contains brief statements of the fundamental doctrines of the Christian faith (including a long section on the constitution of the human person), drawn almost entirely from the writings of the Fathers. The whole work is, in fact, a huge anthology, compiled by John in accordance with a tradition that can already be traced in the 7th century in, for instance, the works of St Maximos the Confessor. Modern theologians are generally rather rude about John's lack of originality, but John did not, any more than any other Byzantine, seek originality, but truth, a truth he found in the tradition of the Fathers. In his *On the Orthodox Faith* he sought to lay bare the theological synthesis, or theological vision, that his immediate predecessors, not least St Maximos, had discerned in the Fathers. A measure of his success is the popularity of this work from the 9th century onwards: it was translated into Arabic and Old Slavonic by the 10th century, into Georgian by the 11th, into Armenian by the 13th, and into Latin twice in the 12th century, with a revised translation by Robert Grosseteste in the 13th. This Latin translation was Thomas Aquinas's principal recourse for knowledge of the Greek patristic tradition.

A further measure of John's unerring grasp of what the theological vision of Orthodoxy entailed can be seen in his prompt and comprehensive response to the iconoclast policies of the emperor Leo III. By the early 730s he had composed two treatises in defence of the veneration of icons, both flanked by extensive patristic florilegia, and only a little later composed a third, more systematic, treatise, supported by a huge patristic florilegium. These treatises, written with the freedom of one beyond the political reach of the Byzantine emperor, contain perhaps the most broadly based theological defence of the veneration of icons ever written, in which a theology of the image or icon is set out, which reaches from the inner life of the Trinity, through the creation of humans in the image of

God, to the essential role played by the image in human understanding, the critical distinction between worship (*latreia*) and veneration (*proskynesis*), and the fundamental role played by matter in the Christian vision of reality affirmed. For his pains, John was anathematized at the iconoclast council of 754, but acclaimed at the Seventh Ecumenical Council in 787.

It is not clear how much of the considerable amount of liturgical poetry ascribed to John is really his, but his most famous poem, the Easter Canon, is generally acknowledged as genuine, and it is likely that several of the canons that survive under his name for the other great feasts are genuine, too. If this is so, then John would appear to be in himself a complete representative of what Byzantine Orthodoxy inherited from Palestine after the final repudiation of iconoclasm in 843. For it was not simply the theological vision that 9th-century Byzantium received from Palestine, but the whole development of the monastic office as well, which was eventually to replace the cathedral office in the church of Hagia Sophia and wherever Christianity was embraced in its Byzantine form.

John Klimakos, St *c.*575–*c.*649

Theologian

John, who now takes his name from his most famous work (*The Ladder of Divine Ascent*), is one of the most important witnesses of the tradition of the Christian desert ascetics. He lived most of his life at St Catherine's, Sinai, and composed perhaps the most influential work of all eastern monastic literature.

He was born sometime around 575 and at the age of 16, *c.*591, he came to Sinai, from an unknown origin, and attached himself to Abba Martyrius, as his neophyte. Daniel of Raithu, his roughly contemporaneous hagiographer, is somewhat obscure about the precise sequence of events; but Abba Martyrius died when John was about 20 years of age, in 595. At this time John must have made his monastic "profession", that is, emerged from his master's cell, no longer a neophyte. Daniel suggests that at this time John went out from Sinai to practise the solitary life, retiring to the Thola region of the desert. He took a cell about 8 km from the main church and here (apart from some journeys to a monastic complex near Alexandria which he speaks of) he lived for 40 years. It was a place of absolute quietude and awesome withdrawal, still pointed out to visitors to Sinai today.

His writings tell of his progress in the monastic life, through what he describes as "standard" stages: his initial tears, his false elations caused by demonic influence, his hatred and disgust for his cell and a desire to flee from the monastic life, his spiritual confirmation in his vocation through perseverance, his beginning of a ministry to others (monks and laity), and finally his acquisition of the gift of "unceasing prayer", and his converse with angels.

After he had pursued the ascetic struggle for many decades, his fame attracted disciples. As more and more began to seek out his cell for spiritual wisdom, the inevitable grumbling began. Monks began to say that he was too garrulous. He silenced criticism by refusing to speak to anyone at all for an entire year, until the community at Sinai finally complained that they had been unfairly deprived of his instruction. It was probably shortly after his year of silence that he was elected as the new superior of the Sinai community, and would have returned to the cenobitic mother-house around 635.

In his final years at Sinai Higumen John of the neighbouring Raithu monastery asked him to compile the work for which he became famous: *The Ladder of Divine Ascent*. It gives practical guidance on the stages of the monastic life and ascetical progress, and probably represents the synoptic form of the numerous spiritual discourses that John had given over the course of a long life. Many parts, therefore, are highly traditional. John's importance lies not so much in his innovative skills, but in his synthesis of an old tradition — a desert master writing in the twilight time, for Arab invasions would soon change the face of Christian Egypt for ever.

After several years as a teacher and leader, John died around 649, according to one tradition appointing his own blood-brother George to be the next abbot, though prophesying that he would rule less than a year. His feast day in the Christian calendar is 30 March and he is also commemorated in the Eastern Church on the Fourth Sunday of Great Lent.

John's book is arranged in 30 sections, the supposed steps of a ladder. The first 23 explain the vices that are dangerous for ascetics; and sections 24–30 interpret the virtues that ought to define a monk. The collation of traditional materials is loosely organized in the work, and some commentators have tried too hard to discern a tight internal structure. Nevertheless, there is a clear sense of breaking with base passions and of ascending

to the stages where the disciple can enjoy close spiritual union with God. In placing Love as the highest step in the ascent, John of Sinai was intending to correct the highly intellectual tradition of Evagrius which had enjoyed a strong vogue in earlier periods of Christian desert spirituality. John sees the monastic ideal as the arrival at *hesychia*, or inner and outer quietness. The *logismoi*, the teeming thoughts that arise in a human mind and heart, need to be identified and exposed without guile or resistance. This ascesis is the necessary prerequisite for advancing to the desired state of continuous prayer. To enable the monk to recognize the spirits of wickedness clearly and arrive at self-awareness in the quest for God, John sets out numerous aphoristic definitions. These have the character of much-circulated common monastic wisdom.

John's spiritual tradition simplified (thereby making its dissemination widely successful) the spirituality of the Gaza school, that of Barsanuphius, and Dorotheus his disciple, and was to go on to be the root and foundation of Athonite monasticism and influence the Orthodox East to the present day. The work teaches that the simplification of nature (its quieting down into spiritual hesychasm), which the monk required to advance his prayer, would be assisted by the constant repetition of a sentence concentrating the mind (for example on the name of Jesus, and his saving power): so-called monologistic prayer. The great Christian tradition of the Jesus prayer grew out of this.

Of the book's 30 steps, no fewer than 16 are concerned with the highly practical matters of how a monk ought to proceed when struggling with passions. This is a very sober text that is not interested in esoteric mysticism. Its understanding of ascesis is based on faithful prayer, quiet and enduring discipleship. Its genius lies in the synthesis it makes of many disparate earlier traditions, not least the resolution it effects between the potentially tense relation of eremitical and cenobitic monastic lifestyles, which it sees as intimately related, thus setting an important precedent for the whole of later eastern Christian monasticism. The work also clearly emanates from an author who has had long and magisterial personal experience. The style is highly pragmatic. He frequently uses the term: "I have seen". This appeal to experience, especially when he sets it against common a priori expectations among inexperienced monastics, was one of the reasons that made the book so highly prized among active Christian ascetics both in antiquity and today. It is still prescribed reading in the refectories of Orthodox monasteries in the time of Great Lent.

John also wrote an *Address to the Shepherd*, a small work that lays out the duties of a monastic superior. It takes its lead from Gregory of Nazianzus' highly influential treatise on the priesthood (which in turn had influenced John Chrysostom and the *Regula Pastoralis* of Gregory the Great).

JOHN A. MCGUCKIN

Biography

Born *c.*575, John Klimakos (John of the Ladder), also known as Scholastikos or of Sinai, became a monk at the age of 16 on Mount Sinai. For 40 years he lived in the desert as an anchorite and gathered many disciples around him. He returned to the Sinai monastery as abbot *c.*635 where he wrote his best-known work, the *Ladder of Divine Ascent*. He died *c.*649.

Joseph the Hymnographer, St

Poet and hymnographer of the 9th century

One of Byzantium's most prolific authors of liturgical poetry, St Joseph the Hymnographer contributed significantly to the cycles of proper hymnodic texts that dominate the modern Byzantine offices. The earliest account of Joseph's life is the late 9th- or early 10th-century *Life* by the monk Theophanes, from which we learn that he was born in Sicily (probably Palermo) between 812 and 818. In or around the year 830 he fled the Arab invasion of his native island with his family. At the age of 15 Joseph left his family in the Peloponnese to continue his studies in Thessalonica, where he entered the monastery of Latomos (known today as Hosios David, but originally dedicated to Christ). Rapid growth in his knowledge and spirituality was followed by his presentation to the city's archbishop for ordination before the canonical age of 30. In Thessalonica Joseph also came into contact with St Gregory the Decapolite, who obtained the permission of his abbot to bring Joseph to Constantinople.

After settling with his new master in the iconophile community of St Antipas, Joseph was sent in 841 by Gregory on a mission to enlist the aid of Pope Gregory IV against the iconoclasts. Captured on the way by pirates and imprisoned on the island of Crete, he was ransomed after the death of the emperor Theophilos in January 842. Theophanes reports that

Joseph miraculously received foreknowledge of his release from St Nicholas, who showed him a book from which he chanted a prayer for deliverance. Upon returning, possibly by way of Thessalonica, to the community of St Antipas in Constantinople, Joseph found that Gregory had recently died. He therefore resumed the monastic life under the direction of John the Ascetic, another follower of the Decapolite. After the latter's death, located by Stiernon around the year 850, Joseph resided for approximately the next five years near a shrine to St John Chrysostom, where he acquired a number of disciples. He then founded a monastery dedicated to St Bartholomew, to which he also translated the bodies of his teachers Gregory and John.

According to Theophanes, Joseph's career as a hymnographer began only after the foundation of his monastery. The story of St Nicholas's appearance and Joseph's authorship of hymns to Cretan saints, however, have led modern scholars to suggest that he began to write soon after his release from captivity. In any case, his productivity probably declined as his friendship with Patriarch Ignatios increasingly involved him in ecclesiastical politics. The deposition of his patron in 858 resulted in Joseph's exile to Cherson until the restoration of Ignatios by Basil I in 867, whereafter he was named *skevophylax* (sacristan) of Hagia Sophia. The eventual reconciliation of Ignatios with his rival Photios allowed Joseph to establish good relations with the latter, who came to hold him in high regard and recommended him as a spiritual father to his clergy. His continuing closeness to the patriarchate is emphasized by Theophanes, who relates how Joseph made a final visit to the patriarchal palace after foreseeing his own death in 886. He died on 3 April, which is observed as his feast day by the Orthodox Church.

The importance of Joseph's contribution to the corpus of Byzantine hymnography is represented in John the Deacon's expanded 11th-century version of his *Life* by the attribution of more than 1000 canons. A more precise assessment is complicated by the difficulty of distinguishing his works from those of Joseph of Thessalonica, the brother of St Theodore of Stoudios. From the preliminary total of 466 pieces assigned to him by E. Tomadakes, it appears that Joseph wrote a vast number of canons while making only minor additions – e.g. 13 *stichera* and nine short kontakia (psalm refrains) – to other repertories. Because his hymns were set to preexisting melodies, Joseph has been honoured as a hymnographer rather than as a *melodos*, a title reserved for poets such as his contemporary Kassia who composed their own melodies.

The work of earlier Sabaïte and Stoudite poets had not left sets of hymnodic propers for every day of the calendar year, and many of Joseph's canons served to fill these gaps in the liturgical cycles of the Palestinian monastic rite. These hymns include poems for the saints of the Byzantine calendar, the commemorations between the eight Sundays of the resurrectional Octoechos, and the movable seasons of Lent and Easter. Although some remain unpublished, a great number of Joseph's canons were included in the liturgical books of the Orthodox Church. Perhaps the most notable of these is the one he wrote to frame the annual Lenten performance of the beloved anonymous (probably 6th-century) *Akathistos* Hymn to the Mother of God. Consisting of 32 stanzas united by an iambic acrostic announcing his authorship, Joseph's hymn is based metrically and melodically on the second canon for the Dormition of the Mother of God (15 August) by John of Damascus. Seven of the Damascene's eight model stanzas are re-used by Joseph with only cosmetic changes to their texts, while the model stanza for the fourth ode is taken from another canon in the same mode. Yet the main inspiration for his text is the *Akathistos* itself, which Joseph uses as a treasury of images for his own song of praise. More densely packed with specific biblical references than the ancient kontakion, Joseph's canon also includes topical references to the Mother of God's role as protectress of Constantinople.

Canonized shortly after his death, Joseph has remained popular as a poet and intercessor. As noted above, his *Life* was expanded in the 11th century, during which John Mavropous also wrote two canons in his honour. A book of rubrics from the same century listing the order of precedence observed in the event of multiple canons for a single saint places the works of Joseph first, followed in descending order of preference by the hymns of Theophanes Graptos, John of Damascus, and Kosmas of Maïouma. Later praised in writing by such late Byzantine authors as Theodore Pediasimos and Nikephoros Kallistos Xanthopoulos, Joseph was also depicted iconographically in the churches of Lagoudera and St Saviour in Chora.

Josephus, Flavius AD 37–after AD 93

Jewish historian

Flavius Josephus was an important figure in the Jewish community at the time of the disastrous Jewish rebellion of AD 66–67. Captured by the Romans while commanding part of the revolutionary forces, he was released and treated with honour for the rest of his life after correctly prophesying that Vespasian would become emperor. He then wrote, in Aramaic,

a history of the revolt as a warning for Jews in the diaspora. This work, entitled *History of the Jewish War against the Romans*, is lost in the original Aramaic version, but the author later rewrote it in Greek with some help from unnamed Greek assistants, and it became his most influential work and for many centuries the definitive history of the revolt. Josephus then went on to write, this time in Greek, a massive history of Judaism from its origins to his times, entitled *Jewish Antiquities*. This work inevitably covers much of the same ground as the Old Testament, on several versions of which it is largely based, but it also makes use of other traditional Jewish writings and presents the events in a manner influenced by the tradition of Greek historiography. The work also goes substantially beyond the period covered by the Old Testament and in fact overlaps with material covered by the *Jewish War*. In addition, Josephus produced two minor works, an autobiography and a polemic in defence of Judaism known as *Against Apion*.

Josephus' style is not entirely consistent: on the whole his works display a good mastery of the Atticizing Greek used for literary purposes in his day, but occasional semiticisms can also be found. It is unclear how much of Josephus' style is his own and how much is due to the helpers he admits to having employed in rewriting the *Jewish War*, and on whom he may have relied for his other works as well. He tells us that he worked hard to overcome his difficulties with the Greek language and to give himself a solid grounding in Greek literature, but the extent of his acquaintance with the Hellenic tradition has been questioned. The influence of Greek authors such as Thucydides and Polybius can certainly be found in his works, as can a conscious determination to present his story to the educated Greek-speaking world in a manner consistent with, and attractive according to, the rules of the Greek literary tradition. Nevertheless there is reason to believe that the primary influence on Josephus was really the Jewish tradition in which he had been educated.

Despite the occasional infelicity, Josephus' works were praised as stylistic models in the Byzantine period (e.g. by Photios in the 9th century and Theodore Metochites in the 14th century), especially for the vividness and immediacy of his historical narration. They were also imitated by authors such as Niketas Choniates (12th–13th century).

Josephus' main importance for the Greek world, however, is to be found in religious rather than literary history. Thanks to the sanction of Christians such as Origen and Eusebius of Caesarea, in the medieval period Josephus' works became one of the most important historical sources for ancient Palestine. They were copied, epitomized, and excerpted freely and were translated into all the major languages of the medieval Mediterranean. From the 3rd century AD onward Christians saw the *Jewish War* in particular as a sort of continuation of the New Testament, showing the punishment of the Jews for the crucifixion of Christ. Authors such as the chronicler Malalas (6th century), the *Chronicon Paschale* (7th century), and Zonaras (12th century) made use of Josephus, or of works derived from his.

At the end of the Byzantine period Josephus' status as a church historian began to be questioned because of differences between his account of history in the *Jewish Antiquities* and that of the Old Testament, and in the 16th and 17th centuries scholars began to debate the genuineness of a passage known as the "Testimonium Flavianum". This brief section of the *Antiquities* (18. 63–64) mentions Jesus and declares him to have been the Messiah; it seems to have been partly interpolated, perhaps in the 3rd century AD. As this passage was crucial to Josephus' status in the Christian Church (it is probably responsible for the fact that he was the only Jewish historian whose works were entirely preserved by the Byzantines), the debate over its authenticity did considerable damage to his reputation. This debate continued until the 19th century and is to a certain extent still current, though it is no longer crucial to the assessment of Josephus' overall worth as a historian.

For most of the Byzantine period Josephus' works, at least in their Greek form, were essentially the property of the Christian Church and remained basically unknown to the Greek Jewish community. In the 10th century, however, an anonymous historian in southern Italy produced a Hebrew chronicle based primarily on Josephus, and in the 11th century a Judaeo-Arabic version followed. Josephus' works were thus reintroduced to the Jewish community after centuries of use as Christian – and often anti-Semitic – documents.

Josephus remains today an important source of information on Jewish history of the 1st century AD, and his dramatic description of his people's tragic fate is as engrossing to read as ever, but his status as the inspired creator of an almost sacred text has been replaced by that of a fallible and often biased observer. His Greek style is also less highly regarded than it once was, and his current influence on Hellenic culture is minimal.

Judicial Procedure

The earliest written Greek laws were believed to be those of Zaleucus of Italian Locri Epizephyrii (*c.*650 BC). These were noted for their severity, as were the first written laws of Athens, those of Draco (621/20). Solon's laws (594/93)

replaced Draco's in all areas except homicide, and the Athenian lawcode was henceforth known as the laws of Solon, regardless of later additions. Under the democracy laws were made in the assembly, and in 410 a revision of the laws was begun. Their inscription on stone led to a distinction between laws (*nomoi*) and decrees (*psephismata*), and from this time decrees of the assembly could not override the written laws, while the framing of new laws was entrusted to groups of "lawmakers" (*nomothetae*).

Athenian laws were essentially procedural rather than substantive. They specified the form of action to be taken against a transgressor without necessarily defining closely the transgression, and sometimes a choice of action was available to the prosecutor. The main categories were public and private actions. In public actions (*dikai demosiai*, but regularly named after the method of initiating the procedure) the offence was thought to affect the whole community, hence in addition to magistrates and officials it was open to "anyone who wishes" (*ho boulomenos*) to raise an action (i.e. any free adult male, except for those who had been disfranchized, and in some cases excluding non-citizens). The fine or penalty in a public action was paid to the state, but rewards were given to those who successfully prosecuted certain actions, especially *apographe* (deposition) and *phasis* (statement). To deter habitual prosecutors (the original use of the term "sycophant"), in most public actions those who initiated but subsequently dropped a case or failed to win at least one-fifth of the jurors' votes had to pay a fine of 1000 drachmas and were debarred from bringing similar actions in future (sycophancy was also an offence, which was prosecuted by *probole* – presentation of a case to the Assembly). Public actions included *graphe*, the regular public action (its name will derive from the fact that originally it was in this kind of action that a written charge was made; by the 4th century BC this had become the norm); *apagoge*, whereby the prosecutor arrested the accused (usually a thief caught in the act or a person caught exercising rights to which he was not entitled) and handed him over to the magistrates (regularly the Eleven); *endeixis*, a similar process to *apagoge*, but where the prosecutor denounced the accused to the magistrates and might then arrest him; *ephegesis*, whereby the prosecutor led the accused to the magistrates and they carried out the arrest; *apographe*, in which the prosecutor listed property allegedly due to the state and being withheld (three-quarters of the property would be given to the successful prosecutor); *phasis*, in which the prosecutor pointed out illegal goods or property (the reward here was one half of the fine imposed or of the confiscated property); *eisangelia*, a denunciation to the council or assembly, which might try the case or refer it to a jury court; *probole*, a denunciation to the assembly, which held a hearing and could, if the prosecutor wished to proceed, send the case to a jury; and cases arising from an official's preliminary examination (*dokimasia*) or his examination after office (*euthynai*).

In private cases (*dikai idiai*, but usually called simply *dikai*) the offence concerned an individual and could only be prosecuted by the person who alleged he had been wronged. If successful, the private prosecutor would be awarded damages or compensation. In *diadikasia* two or more persons disputed a right (especially to an inheritance) or obligation (such as to perform a liturgy) on equal terms. A special form of case was homicide (*dike phonou*), in which the relatives of the deceased were required to prosecute, but the offence concerned the whole community since killers were polluted. Hence the alleged killer was debarred by a proclamation from sacred and public places, three pre-trial hearings were held instead of the usual one, particularly solemn oaths were sworn, the trial itself was held in the open air in one of the special homicide courts, and the parties were each allowed to make two speeches, again instead of the usual one.

Suits were initiated by the prosecutor submitting his charge to the appropriate magistrate and delivering the summons to the defendant. The eponymous archon presided over cases involving the family and inheritance; the *basileus* (second archon) was in charge of homicide and religious cases; the *polemarchos* (third archon) oversaw cases involving non-citizens; the *thesmothetae* (the six junior archons) managed a wide range of cases in their court, the *eliaia*; the Eleven (police commissioners) were in charge of cases involving theft and similar offences; the generals conducted cases of military offences; and there were some lesser boards of magistrates for specific types of case. In the 4th century most private cases came before the Forty, four judges from each of the ten tribes selected by lot. The magistrate heard statements and evidence at an inquiry (*anakrisis*) and could settle minor cases himself, but otherwise would decide if the case should be sent to trial. In a private suit the accused might object that an incorrect procedure was being employed (*paragraphe*), and this would have to be decided by a separate hearing before the action itself could proceed. A trial in a private case before the Forty might be avoided by resorting to binding arbitration, a procedure that existed from earliest times in many Greek states and became particularly widespread during the Hellenistic period. Private and (in cases involving claims for more than ten drachmas) public arbitrators were used, but their decisions were appellable to the courts.

Trials in the 5th and 4th centuries were conducted in the popular jury courts (*dikasteria*). A panel of 6000 jurors over the age of 30 was selected each year, and Pericles introduced jury pay (two, later three obols per day). The size of the jury varied according to the type of case, but regularly numbered several hundred, and in order to prevent bribery jurors were allocated to the different courts by a lot system which became increasingly complex during the 4th century. The magistrate who had received the charge now presided, but did not act like a modern judge in giving directions or advice. Litigants were expected to represent themselves unless clearly unable to do so, but might call on friends to speak on their behalf (*synegoroi*); women and children were represented by their nearest adult male relative. The prosecutor was followed by the defendant, each making one speech which might have been written for him by a professional speech-writer (*logographos*); in the course of the speech laws and other documents might be read out by the court clerk, when the water-clock which timed the speech was stopped. Witnesses, who tended to act as supporters for the parties rather than as suppliers of information, gave evidence orally until the early 4th century and could only be questioned by the litigant who summoned them, but after this time written evidence was used and witnesses merely acknowledged the text was theirs. The disfranchised, women, and children could not appear as witnesses, and slaves' evidence was

only accepted if extracted under torture and by the agreement of both parties (which in practice rarely if ever happened). The jurors had to cast their votes immediately after the speeches, with no summing-up from the magistrate or time to retire for consideration of their verdict. The original system of putting a pebble into one of two urns (one for guilty, one for not guilty) was replaced during the 4th century by a procedure in which each juror had two bronze votes, one of them with a hole to signify guilty, and the votes were cast one into a bronze, "valid" urn, the other into a wooden, "invalid" urn. The verdict was arrived at by a simple majority, with a tie counting as an acquittal (though by the 4th century odd numbers of jurors were used). There was no right of appeal, but the losing party might win compensation from a witness who was proved to have given false evidence, or occasionally have the case reopened. Penalties were either fixed by the law or decided by the jurors, according to the type of suit; in the latter case the two sides made further speeches proposing alternative penalties which the jurors would vote on. Monetary fines were the most common remedy, and other penalties included death, exile, the stocks, full or partial disfranchisement (*atimia*), and confiscation of property. Unlike in modern penal systems, imprisonment was used sparingly as a punishment.

Athenian law had little or no significance in the development of later legal systems, and reasons for this are not hard to find. The lack of a body of substantive law, in glaring contrast with the extensive Roman system, is the most obvious one, the absence of any doctrine of binding precedent another. But there cannot be precedent when every sitting of every court is the supreme and unaccountable representative of the democracy, and that is the point. The decisions of the dicasts were ephemeral, prone to be swayed by the clever speaker at the expense of truth; but the courts, with their large juries, *were* the people for the litigants appearing before them, and the popular jury system lay at the very heart of the Athenian democracy.

Under Byzantine rule the emperor was the supreme judge, who was empowered to delegate authority to institutions or officials. Government bureaux, called "Sekreta", had some right to condemn and pardon, while other judicial functions were performed by the eparch of the city and the quaestor. The *epi ton deiseon* heard petitions and appeals, and the chief of police (*droungarios tis viglas*) also had judicial duties. The highest court was that of the *velum* or Hippodrome; rarely did the senate act as a court; and bishops' jurisdiction in the ecclesiastical courts might trespass into civil law. In the provinces governors were often called "judge" (*krites*), while local cases might be heard by special magistrates from Constantinople.

Julian the Apostate AD 331/32–363

Last pagan emperor of Rome

Flavius Claudius Julianus, the grandson of the emperor Constantius Chlorus, nephew of Constantine the Great and cousin of Constantius II, was the last ruler of the second Flavian dynasty and also the last Roman emperor to worship the gods of Olympus. In his brief life and even briefer reign, Julian sought to undo the hold that Christianity had acquired over the Roman world in the aftermath of the Edict of Milan in AD 312, which had established official tolerance and quasi-official favour for that religion, and also to renew the traditional religious cults of the Mediterranean basin. In addition, he sought through various reforms to strengthen the empire and counteract some of the failings of the governmental system inaugurated by Diocletian and Constantine from AD 285 on. This project of religious, cultural, and political renewal was cut short by his death in battle during a disastrous campaign against the Persians in Mesopotamia. Since his death, he has continued to exercise a fascination over writers, whether they have been hostile to him, as the Christians of his own and following centuries have been, such as Gregory of Nazianzus, the poet Prudentius, and Augustine, or sympathetic, as not only the pagans of his own and following centuries, but also modern authors from the Renaissance on have been, such as Lorenzo de' Medici, Voltaire, Edward Gibbon, and Gore Vidal.

Julian was born in either AD 331 or 332 to Julius Constantius, the son of Constantius Chlorus, by Flavia Maxima Theodora, daughter of Diocletian's colleague Maximian. Julius Constantius was thus the half-brother of Constantine the Great, who made him consul for the year 335, despite the antipathy of Constantius Chlorus' first wife, and Constantine's mother, Helena. After Constantine's death in 337, however, Julius Constantius was put to death with his eldest son, his brother, his brother's two sons, and four other relatives. It is unclear whether his nephew, Constantius II, ordered the executions. A document allegedly found on Constantine's body excluded Flavia Maxima Theodora's sons and grandsons from power, and the dynastic loyalties of the army were in any case behind Constantius II and his brothers Constans and Constantine II. Julian and his surviving half-brother Gallus were interned first separately and then together. Though Julian was kept in Bithynia away from public scrutiny, he was under the protection of Eusebius, the Arian bishop of Nicomedia. Under the tutelage of Mardonius, a Scythian eunuch who had also taught his mother, Julian learned the

elements of the Greek classics that made up the curriculum at that time for all educated men and women, whether pagan or Christian, in the Greek-speaking part of the Roman empire. In later years he was allowed to pursue his studies in Nicomedia, Pergamum, and Ephesus. In 351 Gallus was made Caesar, subordinate under Diocletian's reworking of the governmental structure to the Augustus, or senior emperor, Constantius II, in order to alleviate some of his burdens of rule while the latter dealt with usurpers and uprisings in the west. Both of Constantius' brothers and colleagues had died by this time, victims of political intrigue, so Constantius, in need of a colleague, turned to the older of his only two surviving relatives. Gallus' rule of the east from his headquarters in Antioch became increasingly cruel and irregular, so Constantius removed and executed him in 354, after only three years as Caesar. After a period of time under arrest, Julian was allowed to resume his studies in Athens.

These studies were soon interrupted by a summons to the imperial court at Milan, which resulted in Julian's becoming Caesar in his turn on 6 November 355, and being sent to Gaul, then hard pressed by Germans invading across the Rhine. Though Constantius' dispositions of authority in Gaul seemed designed to leave Julian a mere figurehead who would leave the fighting and governing to others, Julian soon showed aptitudes for both generalship and statecraft remarkable in one who had had no practical experience of either. He took effective control of the Roman armies in Gaul and led them to victories over the Alamannic German invaders, which drove them back across the Rhine and put an end for the time being to their raids. These victories went unacknowledged by Constantius, perhaps partly through the convention of the day that assigned credit to the Augustus for the successes of his Caesar. Julian also encouraged the flourishing of Gaul through resettling and rebuilding cities devastated by the raids of the Alamanni, through reforming tax collection in the lands under his jurisdiction, and through importing grain to make up for shortfalls caused by the depredations of the raiders and by the abandonment of the farmlands by their tillers.

Constantius, perhaps to make up for the loss of six legions in the Persian capture of Amida in August 359, or through concern for his own security caused by Julian's growing prestige, in January 360 send orders to his Caesar to send him his four best legions, plus 300 men each from his other units. The troops, gathered at Julian's winter headquarters at Paris prior to their departure for the emperor's court at Constantinople, were most of them locally recruited and had taken service on the understanding that they would not be called on to cross the Alps. Impelled by this, and perhaps by resentment against Constantius for not acknowledging their victories over the Alamanni, the troops revolted and proclaimed Julian Augustus. It is certainly possible that Julian and his advisers may have induced them to do so, though unclear to what extent. The remainder of that year and much of the next were taken up with fruitless negotiations to settle the situation between Constantius and Julian. When these failed in the face of Constantius' understandable reluctance to surrender power and evident preparations for civil war, Julian began a military campaign against the adherents of Constantius in Italy and the Balkans which was cut short by Constantius' sudden death by illness in November 361.

Julian had hitherto maintained a public persona as a Christian; it was only after his proclamation as Augustus that he openly announced his allegiance to the traditional gods of the Graeco-Roman world. His worship of these gods was shaped by his adherence to the mystery cults of Mithras and of Demeter and Persephone at Eleusis, and by his following of contemporary Neoplatonism, especially of the theurgistic variety practised by Iamblichus and some of his disciples. These tendencies set him apart from the majority of those in the Roman empire who still followed traditional religious practices. Nevertheless, he attempted to undo the work of Constantine in extending tolerance and even favour to Christianity by ending the government subsidies while simultaneously encouraging the maintenance and revival of traditional religious cults. Furthermore, he attempted to sow chaos among Christian congregations by recalling those who had been exiled by Constantius for heresy. A decree forbidding Christians to teach the Greek and Latin classics that made up contemporary education, the indispensable prerequisite to be a gentleman or to pursue a career at the bar or in the civil service, was designed to expose young Christians to pagan propaganda. At the same time he tried to unite pagan cults in a religious hierarchy that could rival the Christian Church by welding them, too, into a centralized organization and especially by imitating Christian philanthropic endeavours to feed the poor. He also sought to reform the imperial court by eliminating many of the servants and functionaries who attended the emperor. In order to strengthen the cities he returned to them the lands and tax revenues to finance their services. In addition, he bolstered the decurions or city councillors, drawn from the local landowning classes and responsible, if need be, for meeting tax assessments and financing city services at their own expense, by cancelling the exemptions from these duties granted to some of these landowners. Plans were also made to reform the tax system as a whole which, however, were not carried out because Julian's reign was cut short.

Julian moved his headquarters to Antioch in the summer of 362 and began to prepare to resume Constantius' war against the Persians by invading their territory. He found himself at odds with the Antiochenes over religious policy, especially after the famous temple of Apollo in the suburb of Daphne was burnt to the ground after he had closed a Christian church in the area. A famine, possibly exacerbated by the concentration of troops in the city for the coming Persian campaign, put the emperor also at odds with the landowning class of Antioch, which he suspected of causing or exploiting the famine for their own gain. Thus, it was possibly with relief that he set out in the spring of 363 on his campaign against the Persians. Though initially successful, he was stymied by a Persian scorched-earth policy and unable to take the Persian capital, Ctesiphon, so he turned his army back towards Roman territory, harried by the Persians on the way. He was mortally wounded in battle, so it was left to his Christian successor Jovian, to extricate the army with a shameful peace that surrendered five Roman provinces to the Persians as the price for the treaty. Rumour persisted in attributing the fatal wound to a Christian Roman, and medieval legend to the supernatural intervention of a saint, though the assailant is unknown and, Roman or Persian, may not have survived the battle.

Julian left three volumes of writings behind, including the fragments of a polemic, *Against the Galileans* [Christians], which have been recovered from a 5th-century rebuttal by Cyril of Alexandria. He also left behind a reputation that was cherished by the dwindling pagans of the Roman empire and execrated by the triumphant Christians. His attempts to discomfit Christianity and promote the traditional cults were of course undone after his death. Indeed the fate of the cause he championed may be summed up in the words (as translated by Algernon Swinburne) that the Delphic Oracle gave his friend Oribasius, who asked on Julian's behalf what could be done to restore the cult of Apollo at Delphi:

> Tell the king, on earth has fallen the glorious dwelling,
> And the water-springs that spake are quenched and dead.
> Not a cell is left the god, no roof, no cover,
> In his hand the prophet laurel flowers no more.

ERIC KYLLO

Biography

Born at Constantinople in AD 331 or 332, Julian was taught in Bithynia by the Arian bishop of Nicomedia and a Scythian eunuch. He later studied in Nicomedia, Pergamum, Ephesus, and Athens. Summoned to Milan by the emperor Constantius II, he was proclaimed Caesar in 355. He won several victories in Gaul and in 361 was acclaimed as Augustus by the army. He sought to restore paganism throughout the empire. He died in battle against the Persians in 363.

Junta 1967–1974

The military coup of 21 April 1967 brought Greece seven years of rule by force, including strict censorship, poll rigging, the banning of political parties and trade unions, involuntary exile, house arrests, imprisonment, and torture. The Colonels' programme for Greece was highly nationalist, irredentist, and Christian, although their efforts ideologically to transform the Greek people never took root. The rule of the military came to a close in July 1974 under its own steam in the midst of growing popular disaffection, a weakening economy, foreign pressures, military mutinies, and a bungled coup on Cyprus. In the intervening years, however, Greece suffered the humiliation of isolation from global affairs and tyrannies at home.

Still a crowned democracy prior to the junta, the Greek state was led by its monarch, who, under the prevailing constitution of 1952, exercised legislative powers. Extremist politics carried their weight, too, as the psychological wounds caused by the internecine and ideological fight of the Civil War (1944–49) had not yet been healed in Greece's political culture. The staunchly rightist leaders of the Junta – colonels George Papadopoulos and Nikolas Makarezos and brigadier Stylianos Pattakos – exploited these phenomena by justifying their actions under the guise of a protectorship against a communist threat, an easy target. A more likely reason for the coup was the predicted electoral victory of Centre Union candidate George Papandreou, who intended to reform the military by purging it of extreme rightists. The colonels eclipsed the May 1967 elections by their swift execution of a NATO manoeuvre, thereby occupying their own country and obliterating political opposition. As the regime scrambled for legitimacy with the monarch, King Constantine attempted his own counter-coup on 13 December 1967, failing miserably and fleeing to Rome. The following year the regime held a referendum on a new constitution. The rigged procedure ensured the constitution's promulgation, which retained the office of the monarch but stripped it of its powers.

As the years passed, the dictatorship reformed its regime by trying to adopt some kind of effective revolutionary government. On 21 March 1972 Papadopoulos was proclaimed regent, merging powers of the head of government with head of state. In 1973 the junta abolished the monarchy by decree, introducing a presidential republic with Papadopoulos as president. He was deposed on 25 November 1973 by a second bloodless coup led by brigadier Demetrios Ioannidis, commander of the military police. Phaedon Gizikis was installed as president with a civilian government. This has been seen as a response to growing civil disobedience, highlighted by the now legendary Polytechnic uprising of 17 November 1973. What began as a peaceful sit-in for free university elections ended with tanks storming the Polytechnic gates and killing unarmed students. This event severely discredited the military regime and attracted greater public opinion against the dictatorship.

Resistance activities, though immediately implemented in April 1967, never gained any radical momentum, although bomb attacks peppered Athens and an attempt on the life of Papadopoulos was made early in his tenure. In addition to gross human rights abuses, restrictions on freedom of expression and a well-documented policy of torture prompted intellectuals both Greek and non-Greek to campaign against the regime, mostly in exile or through underground activities. Artists and writers continued their productivity, publishing abroad or couching their statements in terms understood only by the initiated. Thus began what some scholars consider a new genre in Greek arts, whose impact continues down to the present.

Junta: the Colonels' memorial, Athens – an ugly monument to commemorate an ugly episode in Greek history

The government was buttressed by the implementation of social programmes favourable to those sectors of the population most likely to rebel, including cancellation of agricultural debts, provision of low-cost housing for workers, and the distribution of free textbooks to university students. Meanwhile it brutally carried out its purges of all political opposition, sending dissidents, real or imagined, to prison, exile, and torture. In the infamous words of colonel Papadopoulos, Greece was a patient that had to be tied to the operating table while surgery was performed.

Condemned by most world leaders, and withdrawing in 1969 from the Council of Europe before expulsion, the regime received state visits only from Romania's President Nicolae Ceausescu and US Vice-President Spiro Agnew, whose head of state, Richard M. Nixon, was not entirely free of complicity in the dictatorship. Anti-junta activists, journalists, and Greek political elites campaigned in any venue available, while the latter began to form discreet resistance organizations. Chief among them was the cohort formed around Andreas Papandreou, son of George Papandreou, who would lead the socialists to electoral victory in 1981. Also politically active in exile was the former premier Constantine Karamanlis, later to be hailed as the "restorer" of Greek democracy.

As the junta declined in late 1973 and early 1974, Ioannidis, in an attempt ostensibly to bolster its popularity, tried increasingly to bring Cyprus into the fold of Greece. In July 1974 a coup was launched against Cypriot president archbishop Makarios, which was followed by Turkey's invasion of the island. Three days after the invasion, on 23 July 1974, the dictatorial government surrendered. Under the watchful if not tutelary eye of the United States, Karamanlis the next day was flown in from Paris, like a deus ex machina in Richard Clogg's words, and sworn in as prime minister, in the presence of president Gizikis.

Greece regained its orientation to democratic institutions under the leadership of Karamanlis, who did all the right things – reinstating the Communist Party, putting the monarchy question to referendum, promulgating a new constitution, and making Greece a parliamentary republic. The strong arm of the law also came down hard on the junta leaders and their accomplices, and Papadopoulos remained in jail until his death in 1999. This immediate period of dejuntification clearly enabled Greece to find its footing again both ideologically and psychologically and to start making up for lost time, which it has been doing ever since.

Justin Martyr, St *c.*100–*c.*165

Christian apologist

Justin was the outstanding member of the group of Christian writers of the period *c.*120–220 who are collectively known as the "Greek Apologists". He was converted to the faith he was so vigorously to defend about halfway through his life. His family was a pagan one living in Samaria, his birthplace being Floria Neapolis. His education was thorough, in literature, rhetoric, history, and philosophy. It was to the last that Justin devoted most enthusiasm, seeing in philosophical studies a way of arriving at a measure of truth about the nature of reality by which he could shape his conduct. He claims that he followed a course through a succession of philosophies – Stoic, Peripatetic, Pythagorean, and Platonist – before finding the truth for which he was searching in the Christian scriptures, impressed by belief in the prophets as foreshadowing Christ as the Word and Son of God. He saw no impropriety in continuing to wear his philosopher's cloak as a Christian teacher, as he saw it, of the true philosophy. The period between his conversion and death is sparse in detail. He went to Ephesus and there engaged in a disputation with the Jewish Trypho (*c.*135), before going to Rome to establish a school, though not necessarily a permanent one. He taught there long enough to influence one of his students, Tatian, to follow him in a career of apologetic writing. It was in Rome that Justin wrote his own works in defence of Christianity. The *First Apology* was directed principally to the emperor Antoninus Pius and appeared *c.*155. It was followed by the edition of his *Dialogue with Trypho*. The *Second Apology* has been the subject of debate concerning its relationship with the *First Apology* and its date. It may have followed closely on the *First Apology*, taking up some of its themes, while concentrating its opening attack on a recent specific act of violence against Christians. It has also been dated later, following the accession of the emperor Marcus Aurelius in 161. The vigour of this writing, if indeed it was circulated, may have produced or increased antagonism. Denunciation of Justin and members of his circle is attested, together with an account of their responses. The official report tells how Justin answered the charges against him by offering a digest of the Christian faith, which he concluded was utterly at variance with any demand for sacrifice to the pagan gods. He and his six companions were instantly beheaded.

The demands that Justin made on himself called for a breadth of understanding of contemporary thought and a realistic awareness of the Church's situation within the empire. Before any form of intellectual defence could be offered it was necessary for Justin and his kind to try to dispose of the gossip, whether merely ignorant or knowingly malicious, about the nature of Christian practice. Forays into Platonism, the transcendence of God, or the nature of the divine *Logos* would have little effect on people who accused Christians of incest, cannibalism, or Thyestean feasts, on the basis of garbled reports of Eucharistic worship. Only when this kind of charge had been exposed and that of "atheism" rebutted could debate at a philosophical and religious level begin. Belief in one God inevitably enjoined disbelief in Roman polytheism, but it was claimed that this was not a rejection politically directed against the empire. Justin then felt able to set out the fundamentals of Christian belief in a context that found it unnecessary to abrogate the philosophical background from which he had emerged, particularly its Platonic aspects. The Christian Justin credits with genuine religious insights teachers from the pre-Christian era, including Heraclitus, Socrates, and Plato, alongside Old Testament heroes such as Abraham. This he believes he is able to do because of the very constitution of the human being in the image of God which endows each individual with the possibility of enlightenment, through possession of a share in the divine *Logos*. Human understanding is here based on a much firmer principle than that found in his feeble claim that wisdom among the Greeks is dependent upon their having had access to the writings of Moses. Side by side with this acknowledgement of the status of all humanity goes the unequivocal call for the acceptance of the unique Christian claims on which he has come to base his life and which are to bring him to his death. What emerges is a theology with a strong rooting in

Hebrew prophecy, interpreted, against Philo, as clearly fulfilled in Christ. Whereas this would be a natural line to take with the Jewish thinker, Justin does not shirk from bringing this alien source to the educated Greek readership he seeks in the *First Apology*. However keen he may be to gain a hearing, he does not compromise basic tenets of a distinctively Christian kind, frequently expressing them in a simple credal form, a Trinitarian outline coexisting with a freestanding expression of Christological proclamation. With God the Father presented in transcendent terms, the *Logos* in Justin's thought is vital to any philosophical or religious understanding. He is God's communicator with the world, the sole means by which human beings come to the truth. They are enabled to do this by the very nature of their creation, as within each individual there exists a seed (*sperma*) of the *Logos*, whether the person be Jew, pagan, or Christian. One consequence of Justin's stress on transcendence is a tendency to subordinate the Son. It would, however, be unwise to give too much weight to expressions that take on full significance only later. Again, it is perhaps to be expected that in Justin there should be little more than glancing reference to what was to develop as a theology of the Work of Christ.

Within the Christian community Justin's writing came to be valued not only for the features outlined above, but also for what may be learned in the *First Apology* about the early Church's practice in baptism and the Eucharist. The baptism of those who have come with a knowledge of its significance is administered in the name of the Father, Son, and Holy Spirit, bringing with it remission of sins and spiritual illumination. The liturgy for the newly baptized is described, together with the regular Sunday service, some variants being noted.

Revered as a martyr, respected for his openness to the non-Christian world (his acceptance of Socrates contrasting with his rejection by Theophilus), and as a writer more serviceable than inspiring, Justin, though himself not primarily a theologian, nor yet a philosopher, came to have influence on later theologians, notably Irenaeus and Tertullian and through them on the Christian tradition, as they developed ideas found here in germ.

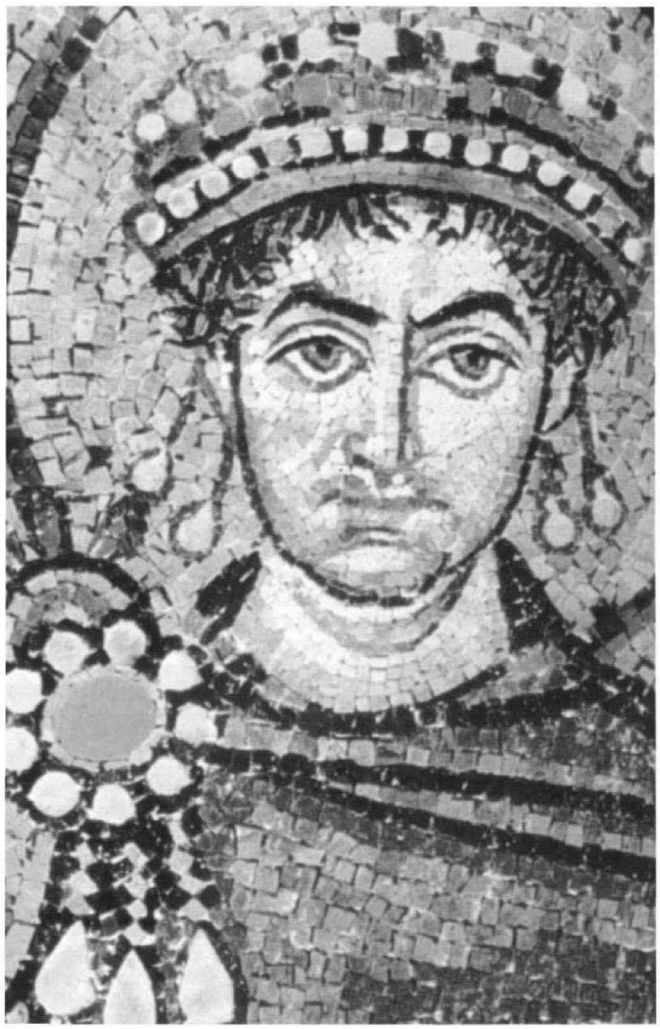
Justinian I *c.*482–565

Emperor

Justinian I (527–65) was the last Latin emperor to rule over a state that encompassed the greater portion of the Mediterranean basin. Procopius of Gaza, the last of the great Classical historians, is our chief source for his reign. Justinian's given name was Flavius Peter Sabbatius and he was born in Bederiana in the province of Dardania around 482. Justinian, originally a member of the imperial bodyguard, was the nephew of the emperor Justin I (518–27) and eventually became co-emperor in 527. He chose as his wife Theodora, who, although known for her unsavoury background, proved to be a great source of strength to him in moments of crisis, especially during the Nika revolt of 532, the most serious challenge to his rule. Justinian was also fortunate in having the able John of Cappadocia as his chief administrator. From the moment he assumed power, Justinian set about achieving the primary goal of his reign, which was the restoration of the empire of Augustus by bringing the lost provinces of the Latin west back under the control of the Roman emperor based in Constantinople. Justinian also felt an obligation to rescue those orthodox Christians in the west who were living under the rule of Arians. To accomplish this goal he launched a series of wars of reconquest under his able generals Belisarius and later Narses against the Vandals in north Africa (533–34) and the Ostrogoths in Italy (535–55). Imperial armies also managed to seize some coastal regions in Spain. However, the renewal of war with Persia forced Justinian to curtail his plans for expansion. Overall, his military endeavours seriously taxed the resources of the Roman state and ultimately proved unsuccessful since many of the newly conquered territories were subsequently lost to the Lombards, who invaded Italy in 568.

In addition to his military achievements, Justinian is famous for his efforts in having all the existing Roman laws, legal text-



Justinian I: mosaic portrait of the emperor in San Vitale, Ravenna, 6th century

books, and legal decisions of famous Roman jurists compiled into a single work known as the *Corpus Iuris Civilis*. Most of this work was supervised by the jurist Tribonian. It was destined to have lasting importance, for it eventually made its way to the Latin west where, in the 11th century, it formed the basis for the revival of the study of Roman law at the newly established universities, such as Bologna, and contributed to the re-establishment of Roman law as the basic rule for continental Europe, a tradition that survives to this day. The emperor also reformed the tax system and sponsored the establishment of a lucrative silk industry in Greece.

Justinian is also renowned for his architectural achievements. He sponsored the building or reconstruction of many new churches and monasteries, the most significant being the monastery of St Catherine on Mount Sinai, which contains one of the most important collections of Byzantine icons dating from the pre-iconoclastic era (8th–9th centuries), and Hagia Sophia in Constantinople. Hagia Sophia is chiefly noted for its spectacular dome and still stands as the third largest church in the world. Upon its completion, it quickly became the most important spiritual centre in the Orthodox world.

Justinian also paid close attention to the spiritual and intellectual lives of his subjects. One of his less commendable acts was to close the Academy in Athens in 529, which was then dominated by pagan Neoplatonists. This act resulted in the emigration of the Academy's scholars to neighbouring Persia, while Neoplatonism continued to attract the interest of Byzantine intellectuals. Justinian also initiated a vigorous campaign of Christianization by ordering the closing of many pagan cult centres and the banning of paganism altogether. How effectively or consistently this policy was carried out is still disputed by scholars since some members of Justinian's administration, such as the jurist Tribonian, were pagans. Another of Justinian's more reprehensible religious policies was his attempt to suppress the Samaritans, a subsect of Judaism, which resulted in a revolt against his rule. In addition, he enacted a series of laws that placed significant legal liabilities on the Jewish community. Other groups singled out for persecution were the Montanists, Manichaeans, and Nestorians. Finally, Justinian tried to resolve the dispute between Monophysite and Chalcedonian Christians over the nature of Christ by convening the Fifth Ecumenical Council at Constantinople in 553. Here he tried to achieve a compromise by condemning the writings of three Nestorian bishops in the Edict of the Three Chapters, even though these writings had been approved by previous ecumenical councils. Justinian also had pope Vigilius brought to Constantinople and held him under house arrest until he agreed to the decisions of the Council. The pope eventually died on his return journey to Italy and was replaced by Pelagius who refused to comply with Justinian's wishes, thus producing a schism that lasted until the 7th century. Ultimately Justinian's efforts to resolve this fundamental division within the Christian community proved a failure and actually served to exacerbate tensions between the Monophysite and Chalcedonian factions.

K

Kabasilas, Nicholas *c.*1319–*c.*1391

Statesman and churchman of the 14th century

Nicholas Kabasilas Chamaetos was born in Thessalonica between 1319 and 1323. Of noble birth, he adopted his mother's family name. He first studied in Thessalonica with his uncle Neilos Kabasilas, who succeeded Gregory Palamas as metropolitan of Thessalonica in 1360. (Until recently, Nicholas was often confused with his uncle, whose baptismal name was Nicholas.) While in Thessalonica he began to frequent hesychast circles, founded by monks from nearby Mount Athos. He later continued his studies in Constantinople. In the civil war of the 1340s Nicholas supported John VI Kantakouzenos, and in 1347 became one of his counsellors, together with Demetrios Kydones. In the hesychast controversy Nicholas appears as a friend of St Gregory Palamas and a supporter of hesychasm. His attitude to the growing influence of Latin theology, however, seems to have been more moderate than many of the hesychasts'. After the abdication of John VI Kantakouzenos in 1354, Nicholas retired from public life and we hear no more about him. Letters that survive from Nicholas to Manuel II Palaiologos make it evident that he was still alive in 1391. There has been much dispute as to how he spent the last half of his life: it has been argued that he became a monk or a priest, but many of these arguments rest on confusion with his uncle. It is most probable that he remained a layman, following the prescription of hesychasts such as Gregory of Sinai, who commended a hesychast life, a life of prayer, combined with active charity, lived "in the world".

From his secular career various works survive: panegyrics, treatises against usury and on (and in defence of) philosophy, as well as several letters. Among his religious works are various homilies, including panegyrics of saints (including St Demetrius), and three homilies on feasts of the Mother of God. In many of these works we find the elaborate diction of the highly educated courtier. But his influence rests largely on two works, composed in a much more direct style, his *Commentary on the Divine Liturgy* and his *Life in Christ*. The immediate influence of these works seems to have been slight. Within decades, the Byzantine empire was to fall to the Turks, and it was in monastic circles that the "inner wisdom" of Christianity was most faithfully preserved. Nicholas's two works, unusually for works of Byzantine spirituality, envisage a primarily lay audience; he was not included in the 18th-century hesychast anthology, the *Philokalia*. In recent times, however, they have found recognition as classics of Orthodox sacramental spirituality: the very title of St John of Kronstadt's spiritual autobiography, *My Life in Christ* (1889), pays tribute to Kabasilas.

Both the *Commentary on the Divine Liturgy* and the *Life in Christ* expound a spirituality founded on the sacraments. The *Commentary* explains the actions and prayers of the liturgy from the preparation of the bread and the wine (the *prothesis*) through to communion, with a long theological parenthesis inserted before the final chapter. This parenthesis deals with matters such as the value of the celebration of the liturgy for the departed, the role of the saints, and the nature of the Eucharistic sacrifice. Some have detected the influence of Thomas Aquinas in his parenthesis; earlier on, however, there is a spirited defence of the invocation (*epiklesis*) of the Holy Spirit against Latin objections. The explanation of the liturgical actions it provides is largely an elaboration of traditional explanations that can be traced back to the commentary by Germanos I. The liturgical celebration yields benefits through both intercession and participation. The inspiration of much of Kabasilas's unfolding of the significance of the liturgical action is frequently to be traced to Dionysius the Areopagite. A similar inspiration can be detected in the *Life of Christ*, notably in the choice of the three sacraments, baptism, oil (*myron*), and the Eucharist, that form the subject of the three principal chapters (cf. Dionysius, *Ecclesiasical Hierarchy*, 2–4). This concentration on the sacramental yields a spirituality that neither requires nor advocates monastic seclusion: "the general may remain in command, the farmer may till the soil, the artisan may exercise his craft, and no one will have to desist from his usual employment because of it. One need not betake oneself to a remote spot, nor eat unaccustomed food, nor even dress differently, nor ruin one's health nor venture on any reckless act" (6. 42). Nevertheless prayer is given great importance, and one of the effects of the Eucharist is to create in the communicant a "sanctuary of the heart" (6. 103). Nicholas's two works constitute an unparalleled exposition of the "lay hesychasm", often envisaged in the writings of the hesychast monks.

Biography

Born in Thessalonica *c.*1319 into a noble family, Nicholas adopted his mother's name (Kabasilas) instead of his father's (Chamaetos). He studied first in Thessalonica under his uncle Neilos Kabasilas and then in Constantinople. He allied himself with John VI Kantakouzenos in the civil war of the 1340s and with St Gregory Palamas in the hesychast controversy. He wrote on secular as well as religious topics. He died after 1391.

Kafeneion

In the Hellenic world, where there is talk, there is smoke, fire...and caffeine. These elements come together in one of the most omnipresent institutions among Greeks – the coffee shop, or *kafeneion*. Whether the coffee ordered there is prefaced by the modifier "Turkish" or "Greek", it is basically the same article – that heavy muddish potable in a small cup, potent enough to lubricate the wheels of the mind and mysterious enough to ensure a rich fortune-telling in the grounds when the drink nears its end. For Greeks, coffee is both a transient pleasure and a lingering memory fortifying the day until the next cup. Without coffee, and the ritual of its preparation and consumption, Greek life would be a blur of mundane comings and goings. With coffee, less a dietary supplement than a soft narcotic or social stimulant, life comes alive; its busy nature is ensured punctuated respite. And the environment in which it is drunk is the passport to circadian nirvana.

The *kafeneion* can be found wherever more than one person pauses in a public place for a sip. It is not uncommon to find in Greece ad hoc *kafeneia* on street corners, where people spontaneously pull up a chair from a shop and a stool from somewhere else, perhaps a box to serve as table, and pass the time together talking things over. The warm climate encourages these outdoor assemblages. The *kafeneion* as an institution, however, is more uniform. Like any coffee shop round the world, it boasts modest chairs and tables, a pedestrian unadorned atmosphere. The *kafeneion* is well stocked with soft drinks, cocoa, prepackaged ice cream. There its transcendence stops. The Greek coffee shop would not be recognizable without smoke-clouded windows, a counter, perhaps covered in tin, a glass enclosure housing a few small syrup-drenched morsels to complement the bitter coffee on the palate and olives and cheese to complement the aniseed-flavoured ouzo as it eases towards the stomach. Finally there are the coffee-making accoutrements.

The *vriki* is the long-handled lipped copper or sterling pot used for making coffee; quite small in size, and commonly built to hold two, four, and rarely more than six cupfuls at a time. The cups, or *flitzani*, are demitasses, with petite handles and diminutive accompanying saucers. The pulverized coffee is prepared over a direct flame with water and sugar (*sketo*, plain, i.e. without sugar; *metrio*, medium; *glyko*, sweet), raised from the flame as it begins to boil, and set and raised two more times for a full froth before pouring. Some interpreters suggest the thrice-boiled concoction echoes the concept of the Holy Trinity, and hence its practice in the largely Orthodox Greek communities, although secularists lift and set three times merely to maximize the froth (*kaimaki*). The preparatory ritual, in any event, ultimately gives way to consumption, always with a side glass of water. The taste of the *sketo* is bitter and robust.

As a social institution, the *kafeneion* is usually a place reserved for men, as tradition has it. The *kafeneion* is not to be confused with the more variegated coffee houses, cafés, or *zacharoplasteia* (sweet shops), which are more pluralistic in clientele. Women, tourists, students, young professionals frequent these venues, while the *kafeneion* is, in the popular imagination, what it always has been – fairly limited to the discrete, leisurely, and quasi-business activities of a male population. The *kafeneion* is common not only in Greece and Cyprus but in the Hellenic diaspora, in neighbourhoods from Milwaukee to Melbourne. Usually knowing no distinction among class or station, patrons are recognizable to one another by dint of their close spatial proximity – every urban neighbourhood has a *kafeneion*. Hence, there is an implicit, if sometimes superficial, familiar feeling. The *kafeneia*, however, can be political spaces as well, with one *kafeneion* welcoming members only of the rightist party, for example, and the rival *kafeneion* welcoming only the opposition.

The *kafeneion* finds its roots in the early 17th century, where long-distance travellers eastward of the Levant looked to the coffee tent as a country inn of sorts, an outpost between metropolises on the caravan route. Recalling these early roots, in decades prior to the information boom, the more remote, rural areas of Greece and Cyprus, with limited access to newspapers and electronic media, were reliant upon the *kafeneion* as an information-exchange centre. Also the difficulty in obtaining telephone lines in Greece forced face-to-face communal gatherings in the reliable venue of the *kafeneion*, even in the cities. This is still the case in some isolated areas including island villages. As the practice goes, one informant will return to his village from having visited an urban centre and deliver the latest salient development to his cohort. In such rural areas, where village elders, heads of households, and other community or business leaders of the village visit the *kafeneion* regularly, issues of the commonweal might be deliberated and debated until consensus is formed. It is not uncommon for official business to be conducted in this informal environment, and

Kafeneion: traditional *kafeneion* in the port of Karlovasi on Samos

in this respect, the *kafeneion* may serve as an extension of the political realm. Decisions made there may determine how votes are cast in town or village councils.

On the other hand, the *kafeneion* is a place of leisure and male camaraderie, a break from home life, which tends to be the domain of women and children. Gambling might take place, over a game of backgammon, chess, or some manifestation of cards, but rarely for high stakes. In the old days the smoking of hashish brought about a different kind of nirvana, but since the early 20th century the drug has been banned in Greece. If one can speak for a moment about the oral tradition of the Hellenic world, where talk is a pleasure in and of itself, without necessarily consensual ends, the *kafeneion* also occasions demonstrative rhetorical bravado. Not to be outdone by one's companions, participants in the discussion may crescendo and diminuendo with flourishes of thought and speech in both emotive and logical twists and turns before an attentive and critical audience for the sheer joy of performance. In this, *couventa* (conversation) is a key commonality and tacit attraction among *kafeneion* patrons, who claim the *kafeneion* as a place of their own.

Kaftantzoglou, Lysandros 1811–1885

Architect

Lysandros Kaftantzoglou was one of the leading architects of 19th-century Greece. He was born in Thessalonica into an aristocratic Macedonian family, whose name of Spandoni (or Spandouni) was replaced by an honorary one derived from the Ottoman kaftan which certain privileged subjects were allowed to wear. Taken by his mother to France as a refugee from the troubles which followed the start of the War of

Independence in 1821, he was educated initially in Marseilles, and subsequently studied architecture at the Academy of Fine Arts in Rome. In 1834, at the age of 22, he won first prize in an international competition for the design of Milan university. In the same year he graduated and returned to France. He travelled widely in Europe, where his work was highly regarded. He was elected to membership of numerous professional bodies both there and in the United States.

He first returned to Greece in 1838, when he visited Athens to participate in a competition for the design of the university. A show of his work was well received by the public but he was in serious disagreement with the dominant Bavarian and German architects over the town plan for the development of Athens. This reached such a pitch that court action resulted and Kaftantzoglou left Athens, disenchanted, in 1839. He spent the next four years first in Thessalonica, where he studied Byzantine architecture, and then in Constantinople, where he continued his architectural research and designed some houses.

When he returned once more to Athens in 1843, one of the Bavarians who had been removed from office in the anti-Othonian climate which then prevailed was the director of the Techniko Scholeio. The following year Kaftantzoglou became its first Greek director. With the help of Tositsa and Stournari, with whom he had discussed the idea some years earlier, this was now transformed into Athens Polytechnic. With great enthusiasm Kaftantzoglou set about establishing the educational and administrative structures of the institution, as well as teaching. The new polytechnic building (1861–76), in Odos Patission (28 Oktovriou), which he designed, is generally regarded as one of his greatest achievements. The approach is flanked by two single-storey buildings with Doric stoas; the main building, constructed round an open interior court, is approached by a massive Ionic porch at first-floor level.

Kaftantzoglou's architectural style was strongly Neoclassical in character, based on ancient and Renaissance architecture and much influenced by contemporary developments in Europe. He drew also from Byzantine architecture, which at the time was not highly regarded. In his houses, which mostly survive only in drawings, he shows a more varied and lighter touch. His work is often contrasted with that of his contemporary and bitter rival Stamatis Kleanthis (1802–62), whose Romantic style often made use of Gothic elements. The two were professional and personal rivals and conducted highly publicized quarrels in the press. In 1845 Kaftantzoglou succeeded in wresting the commission for the Arsakeion (another of his major works, completed in 1852) from Kleanthis, who had already spent two years on the project.

In addition to the two buildings already mentioned Kaftantzoglou's prolific output included many private houses, very few of which have survived, the Catholic church of St Denis in Panepistimiou (started by Klentze), the Orthodox churches of Hagia Irini and Hagios Konstantinos in Athens, and many other buildings elsewhere in Greece. He was also well known for an ambitiously designed but subsequently unbuilt heroon, designed in 1830 as a monument to the heroes of 1821. His comments on the design show both his attachment to Classical architecture (the Propylaea of Mnesicles) and his interest in the symbolic use of architectural forms and motifs (the Doric and Ionic orders to signify the two tribes of Greece; the circular form, eternity).

His later years were embittered. His leadership of the polytechnic was violently challenged, partly because of the changing political climate. After his resignation (1862) he largely shut himself off from public life and died in Athens in 1885.

ROBIN L.N. BARBER

Biography

Born in Thessalonica in 1811, Kaftantzoglou went with his mother to Paris in 1821. He studied in Marseilles, and then at the Academy of Fine Arts in Rome. In 1834 he won a competition to design Milan University. He returned to Greece in 1838 and in 1844 became director of the Polytechnic, whose new building he designed. He died in Athens in 1885.

Kalamata

Port in the southern Peloponnese

At the head of the Messenian Gulf, sheltered by the huge flanks of the Taygetos mountains, and watered by the river Nedon is Kalamata, the capital of the province of Messenia. With its 44,000 inhabitants Kalamata is one of the larger Greek cities. Harbour, train station, and airport make the city an important commercial centre. Kalamata olives have a high reputation. Tourism is centred in the seaside area of the city. The long boulevard is flanked by numerous hotels and restaurants. On 14 September 1986 a severe earthquake struck the centre of Kalamata. The increased building activities in the city are due to this catastrophe.

Excavations have shown that Kalamata occupies the site of ancient Pherae which is most likely identified with the Pherae of the Homeric poems. In the *Iliad* "sacred Pherae" is one of the seven cities "on the border of sandy Pylos" that Agamemnon offers Achilles, hoping to persuade him to take up arms again (9. 149). According to the *Iliad* (5. 541–53) this Pherae is inhabited by Diocles and his sons, who set out for Troy to gain honour for the Atreids. In the *Odyssey* (3. 488 and 15. 186) Telemachus twice visits Diocles in Pherae on his way from Pylos to Sparta and back.

The status of Pherae in this period is not clear. A Linear B tablet (An 661) from Nestor's palace at Pylos may throw some light on this matter. It says, apparently in a case of emergency, that 30 members of the coast guard are to be sent to the Nedon. This river, and consequently Pherae, seem not to have

been part of the area ruled by the palace, because the kingdom's coast was already occupied by guards.

The overall picture seems to indicate that Pherae did not strictly belong to the kingdom of Pylos, nor to Sparta. Situated "on the border of sandy Pylos" here apparently means on the other side of the border, because Nestor did not oppose Agamemnon when the seven cities were offered to Achilles. He would not have been so friendly if Agamemnon had been about to give away seven Pylian cities. The marshes of the Pamisos estuary in the lower Messenian plain could well have formed a natural border between Pylos and Pherae. But Pherae was not a kingdom itself, as stated by Homer, who never calls Diocles and his family kings, but just inhabitants of the city. The participation of Diocles' sons in the Trojan War in the regiments of Menelaus seems to indicate some degree of dependence of Pherae on Sparta.

In the 8th century BC Pherae was annexed by the Spartans, who kept dominion over the city until 371 BC, when the Thebans liberated Messenia. Pherae again fell into Laconian hands after the battle of Actium in 31 BC, when Augustus donated the city to his Spartan allies. Tiberius (AD 14–37) in his turn assigned the cities on the western flank of Mount Taygetos to Messenia. According to Pausanias (4. 30. 3), Pherae was an ancient medical centre. He writes that Diocles' daughter Anticleia married Machaon, the illustrious son of Asclepius. Their descendants remained in Pherae, and with them the power of healing diseases and curing the maimed. Pausanias refers to a sanctuary of Machaon's sons in Pherae and his tomb in Gerenia (modern Kambos).

In Byzantine times the name Pherae changed into Kalamata, perhaps after the monastery of the Panagia of Kalomata. In AD 1208 the Frankish baron Geoffrey I de Villehardouin acquired the barony of Messenia and refortified the Byzantine fortress on the acropolis of ancient Pherae. Here his son William was born in 1218. The Villehardouins kept possession of Kalamata for almost a century. They even retained it after the disastrous battle of Pelagonia in 1259, when they had to give up Mistra and other Laconian possessions to the Byzantine John Palaiologos. William died at Kalamata in 1278, leaving no male heirs. The city passed to Charles d'Anjou and in 1299 to Guy de la Roche. Kalamata was now part of the Duchy of Athens. In 1425 the city passed to the Palaiologoi and in 1460 the Ottomans took control. The Venetians conquered Kalamata during the Morosini campaign of 1685. The German general Dengenfeld took the city with his army of 8000 mercenaries, among who were 1500 Maniots. The Venetians, however, were even less popular than the Turks, and when the vizir Damat Ali appeared in the Peloponnese in 1715, the Venetians were driven out of their fortresses with the help of the people.

During the Orloff campaign of 1770 Kalamata was freed again from the Ottomans. A small division, consisting of 200 Maniots and 12 Russians captured the city. But again the Turks struck back, destroying the churches and the houses.

In 1821 Kalamata is said to have been be the first Greek city to take up arms against the Turks. Indeed, on 23 March Kalamata was liberated from Turkish occupation by the Maniot troops of Petrobey Mavromichalis, Mourtzinos, and Theodore Kolokotronis. Four years later, however, Ibrahim Pasha reconquered the city after heavy bombardments. After the glorious battle of Navarino in 1827 Kalamata was returned to Greek hands for good.

MAARTEN J. GROND

Summary

A city in the southern Peloponnese, Kalamata is the captial of the province of Messenia and an important commercial centre. In antiquity it was known as Pherae and was annexed by Sparta from the 8th to 4th centuries BC. It was an ancient centre of healing cults. Its name was changed to Kalamata in the Byzantine period. It was occupied by Franks in the 13th and 14th centuries and was the first city to take up arms against the Turks in 1821.

Kalvos, Andreas 1792–1869

Poet of the Heptanesian school

With a reputation as the principal renovator of modern Greek lyric expression and the leader of the Neoclassical movement in Greek poetry, Andreas Kalvos is regarded as one of the most important figures in laying the foundations of the modern Greek poetic tradition. At the same time he made an important contribution to the intellectual movement known as the Heptanesian school that flourished in the Ionian islands and signalled a cultural reawakening. However, Kalvos is one of the least prolific poets in the modern Greek literary tradition. His poetic production is confined to a single volume that was published under the general title *Odes* and which comprises two independent collections which appeared under the titles *Lyre* (Geneva, 1824) and *Lyrics* (Paris, 1826). Nevertheless, apart from poetry Kalvos also produced a notable body of literary work of great variety ranging from tragedies, translations, short essays of philosophical, social, and theological contenr, elementary textbooks of grammar, and other educational material to reports and critical articles of a political nature published in the journals and daily newspapers of his rime.

Kalvos composed just 20 poems, all connected with the Greek War of Independence of 1821. However, he loved solitude and throughout his life he remained inaccessible and unknown, and his books of verse were indifferently received and recognized only posthumously. Attached to the idea of nation, as well as to the ancient Greek ideals of morality and justice, he extolled the national revolutionary spirit. His poetry is distinguished for its eye-catching, daring imagery, its impressive mode of expression, and its elegant, extremely personal style.

Kalvos was born and spent his early childhood in Zakynthos in the most transitory period of that island's history. It was the period when the Ionian islands were offi-

cially annexed to France. The same period was marked by the endeavour of the petty bourgeoisie to transfer the power of the nobles to its own hands. At the same time, the ideas of the Enlightenment and the Encyclopedists were prevalent and moulded the European intellectual world. Kalvos was prepared to assimilate and evoke the reformist spirit in his verse. His acquaintance with the Italian revolutionary poet Ugo Foscolo had a profound influence on his career and personal style. Thus, influenced by the challenging ideals of the revolutionary age, excited by the national reawakening of his fatherland, and professing his Greekness, he was capable of writing poetry through which all those influences found an expression. His poetry was the melting pot in which French liberalism, Germanic idealism, and idealistic perfectionism in its Romantic or Classical interpretation blended with the Hellenic tradition. As a consequence Kalvos's contribution to the Hellenic tradition is evident from the fact that he never used his poetry as an instrument to express the ideas of Europe but to fertilize them in his own cultural tradition. He was not an imitator of foreign forms and spiritual models but the poet who succeeded in expressing the pulsation of his age and renewing the Hellenic tradition.

The characteristic elements of his poetry are revolutionary patriotism, devotion to his country, and the vital role of justice and virtue in the existence of nations. Through these elements the political character of his poetry becomes evident. In this manner Kalvos had a profound effect on the poetry of the postwar generation of Greek poets who sought the political dimension of poetry (e.g. Ritsos, Vretakos, Seferis).

Turning to the thematic framework of Kalvos's poetry, one could say that nearly all of his poems are connected with and refer directly to the Greek revolution from which he drew his inspiration and to the final success of which he wanted to contribute through his art. However, his aim was a deeper one: to speak up for virtue and justice, the heroic spirit, valour, courage, and ethical integrity, and to oppose injustice, oppression, despotism, and tyranny. His idea of virtue – the clearest theme in his poetry – is a complex but sublime synthesis of many different concepts. For Kalvos virtue is the connecting link that joins the Hellenic tradition from Homer to the contemporary era and to western culture. Kalvos's Aristotelian virtue is perceived as a moral idea with a Christian meaning. It is also perceived in its ancient Greek context as the bravery of Homer's epics or the historical record of Classical Greece. At the same time it is the proud dignity of manliness, a common element in both ancient Greek tradition and popular folksong. And it is identified with the idea of freedom and encapsulates the enduring strength of the Hellenic historical process. A similar idea was presented by Pericles when he thought of virtue as the necessary condition for the existence of freedom. Finally, Kalvos's virtue entailed the idea of social offering and the desire for the fulfilment of human happiness as expressed by Diderot.

An equally significant theme in Kalvos's poems is the idea of religiosity. Kalvos was concerned with religion in its broader context. He often refers to God but categorically refuses to define him. Thus he is thought to have believed in a superhuman controlling power, in a personal god or gods deserving his obedience, respect, and worship. This supernatural power can be seen as the voice of justice and truth, able to punish any abuse. It is the power responsible for the settlement of the moral norm and the ethical order. To this extent, Kalvos's god seems to be identified with Zeus as well as with the ancient punitive and avenging Furies such as are presented in the tragedies of Aeschylus and Sophocles. Nevertheless, Kalvos does not reject the Christian dimension, since he pays respect to an omnipotent monotheistic God, the equivalent of the Byzantine/Orthodox perpetual ruler of the world.

Another distinctive motif of Kalvos's poetry is the idea of love of one's native land. The same feeling of nostalgia overcame Odysseus when he was away from Ithaca and was reminded of home. Meanwhile Kalvos composed a hymn to the natural landscape of Greece. Nature becomes the mother figure, which symbolizes the source of life and the ultimate expression of pure instincts. The same idea runs through the Hellenic literary tradition from Homer to lyric pastoral poetry, and is then transmitted to folk tradition in order to permeate the work of modern Greek poets such as Palamas and Elytis.

With respect to the particular components of Kalvos's poetry one could say that his verse is marked by sublime ideas, dramatic tone, alluring imagery, and sensuous appeal, elements that characterized the verse of Pindar. The plangency of a number of natural images in his poetry owes something to the tone of the Romantics. His correct use of metaphors, his strong similes, and his frequent use of antithesis had an immense influence on the expression, versification, and style of Palamas and Seferis and to an even greater extent on Elytis, who devoted his verse to the description and exaltation of the Greek countryside. Kalvos's strong didactic element and his dense epigrammatic phraseology made an enormous impact on Seferis's verse, where big ideas and ethics are expressed by means of aphorism or axiom. Kalvos did follow a particular metrical norm but was inclined to write in blank verse. In this way he encouraged the next generation to write in blank verse without neglecting the power of the metrical norm which was still the basis for any kind of poetry. Although Kalvos made extensive use of the Neoclassical models, he never escaped the enchanting power of Romanticism, which gives priority to imagination, releases emotions, and liberates poetical expression. His ideal was a Classical one but his expression Romantic. As far as his idiom is concerned, Kalvos's language is an original personal device. It is an admixture of the vernacular spoken language and its inexhaustible archaic form. His idiom contains elements of three different sources: the ancient Greek tradition, the linguistic idiom of Adamantios Korais and Rigas Velestinlis and other Greek intellectuals abroad, and the vernacular language comprising a number of idiomatic expressions and local elements.

Kalvos is not simply a contributor to the Hellenic poetic tradition but, more importantly, he is a genuine representative of his own era as well as a spirited inaugurator of modern Greek poetic expression. In Kalvos's poetry the whole world, nature, and history become a unique omnipotent vision under the patronage and protection of an almighty God.

MARIA ROUMBALOU

Biography

Born in Zakynthos in 1792, Kalvos had little education. But in 1812 he met Ugo Foscolo in Florence and remained his companion in exile until 1820. He wrote only two books of poetry – *Lyre* (1824) and

Lyrics (1826) – each containing ten patriotic odes inspired by the War of Independence. Returning to Greece, he settled in Corfu and taught for a time at the Ionian Academy. In 1852 he moved to England where he married for a second time, and died in 1869.

Kanaris, Constantine 1795–1877

Naval hero of the Greek War of Independence and prime minister of Greece

Kanaris was born on the eastern Aegean island of Psara into a prominent family of mariners. He went to sea at an early age by joining the crew of a veteran captain and family relative as a junior rating. Observers soon noticed the young man's bravery, presence of mind, and seamanship. He was barely 20 when he was given the command of a brig sailing the traditional trade route to and from the Aegean islands and Black Sea ports. It was at the port of Odessa that Kanaris first heard of the *Philiki Hetaireia* (literally, the "Friendly Society"), a clandestine association of prominent members of the Greek diaspora who were planning a rising of the Greeks against Ottoman rule. The young captain declined to join, perhaps uncomfortable with the thought of a secret society, but his dedication to the cause of Greek independence was strong and he maintained close links with *Philiki Hetaireia* members. When he heard of outbreak of the revolution in the spring of 1821, he hastily returned to the Aegean in order to join the battle. Such was his enthusiasm that he turned his ship over to relatives and joined a squadron as commander of a fireship.

So it was, on the night of 6 June 1822, that Kanaris stealthily entered the harbour of Chios island and approached the flagship of the Turkish admiral Kara Ali which was riding at anchor. All hands were merrily observing a Muslim religious holiday. He quickly set the charges and rammed the flagship, causing her to explode and sink within minutes. More than 2000 Turks, including the admiral himself, were trapped inside the ship and went to the bottom. Four months later, Kanaris repeated this feat off the island of Tenedos by ramming and exploding a ship of the line which was escorting the flagship of Mehmet Pasha, Kara Ali's successor. This time the casualties were nearly 1000 men, including many Christians serving under Ottoman colours. As a result of these two actions the Ottoman fleet hastily sought refuge in the Dardanelles. Similar actions in the following years, and always to the grief of his Turkish enemies, made Kanaris the most feared Greek fireship commander in the Aegean. In the summer of 1825 an audacious plan to strike a strategic blow against the Ottoman naval forces brought him to the Egyptian port of Alexandria. He hoisted the Russian flag and entered the harbour pretending to be an innocent arrival. His target was an Ottoman armada comprising 60 ships of the line and nearly 200 transports which was preparing to sail for Greece. Luckily for the unsuspecting Egyptians, a sudden drop in the wind forced Kanaris to abort the attack and escape in the direction of two Greek ships with Ottoman squadrons in hot pursuit.

When the revolution ended with the founding of an independent Greek state in 1829, Kanaris was one of the first officers commissioned in its young navy. He was soon confronted with the vagaries and pains of political instability attending the birth of the new state. An attempt by the first governor of Greece, Ioannis Kapodistria, to establish a centralized administration caused a violent reaction among war veterans, who felt that Kapodistria was attempting to substitute his own version of "Frankish" autocracy for Ottoman rule. Kanaris, who had been promoted to the rank of captain and appointed senator by Kapodistria, was soon ordered to pursue and arrest a prominent Peloponnesian, Petrobey Mavromichalis, whose clan had vowed to fight the governor to the finish and which was to assassinate him soon after Petrobey's arrest. In 1831 Kanaris, now the commanding officer of the Poros naval station, was confronted with a naval mutiny led by his friend, fellow fighter, and admiral from the island of Hydra, Andreas Miaoulis. The mutiny, one of the most dramatic events of the first years of Greek independence, resulted in the scuttling of two precious ships of the line and Miaoulis's escape back to Hydra under fire.

Deeply disillusioned by these fratricidal struggles and by the virulent political infighting, Kanaris retired to his home island of Psara and, later, to the island of Syros. But on the arrival of prince Otto of Bavaria, appointed king of the Hellenes by the Great Powers in 1833, he was recalled to active duty and promoted to vice admiral. In time, however, growing dissatisfaction with king Otho's arrogant rule and his personal cabinet of Bavarian advisers led Kanaris to join a secret political movement that aimed at forcing the king to grant political liberties to his subjects. In September 1843 Otho was confronted by an army ultimatum and, with thousands demonstrating outside his palace, reluctantly agreed to sign a constitution. Despite his involvement with what amounted to a coup d'état, Kanaris was still one of the most respected surviving figures of the War of Independence and was to serve several times as minister and prime minister.

Thirteen years would pass before Kanaris, a man of deeply conservative principles, was ready to side openly with those advocating the overthrow of the king. The catalyst was Otho's refusal in 1862 to appoint to Kanaris's cabinet the ministers the admiral had nominated. In protest, Kanaris rejected the royal mandate to form a government. In May 1863, after Otho's abdication and departure from Greece, Kanaris headed a Greek delegation to Denmark to offer the Hellenic crown to prince George, second son of king Christian. Recognizing Kanaris's revered position among the Greeks, the new king appointed him his prime minister, a post he held for a year. In 1865 the admiral retired to his small house in Athens and there remained as Greece's respected elder statesman until, in May

1877, he was again appointed to head a so-called Ecumenical Government. He died three months later.

Although Kanaris lacked a formal education, his contemporaries spoke of his deep understanding of politics and society and his highly sophisticated sense of leadership. He was described as a fearless, but not a reckless, man. His fellow fighters found him always respectful of the uncertainties of war, but never afraid of the prospect of battle. As a political man, Kanaris conducted himself with a firm sense of balance and a profound respect for political order, a characteristic that often helped him rise above the abysmal enmities and divisions wracking Greek politics. A naturally unassuming man, Kanaris stood out among his fellow war veterans, who often displayed a rather brusque approach to the affairs of state. Those who met him for the first time towards the end of his life expressed surprise at what they saw as a contradiction between a serene, wise old man and the daring young Kanaris who had struck fear in the hearts of his enemies during his many victories at sea.

Biography

Born on the island of Psara in 1795, Kanaris received no formal education and went to sea at an early age. In the War of Independence he served heroically as commander of a fireship. After independence he became a naval officer and in 1831 quelled a mutiny led by Miaoulis. He served several terms as prime minister and in 1863 led the Greek delegation to offer the crown to Prince George of Denmark. He died in Athens in 1877.

Kantakouzenos family

The Kantakouzenoi were a noble Byzantine family with a long history reaching back at least to the 11th century. The first recorded Kantakouzenos appears during the reign of Alexios I Komnenos (1081–1118). During the 13th century branches of the family appeared in the Peloponnese and in Nicaea. After the recovery of Constantinople from the Franks in 1261, the family played an important role in the public life of the empire and one member of it, John Kantakouzenos, became emperor. After the fall of Constantinople (1453), some members of the family became governors of the Danubian principalities, while others became prominent as officers in the Russian army and participated in the Greek War of Independence (1821). There are many opinions as to the origin of the name Kantakouzenos. The most probable is that it derives from the local name of a mountain (Kouzenas) near Smyrna. The most prominent members of the family are discussed below.

Kantakouzenos (his first name remains unknown) appears to have been the first member of the family to achieve distinction or rank. He was a general during the reign of Alexios I Komnenos and took part in the defensive campaign against the Cumans in 1094. In 1104 the emperor sent him to Syria against the Genoese fleet where he captured the harbour of Laodicea as well as neighbouring territories. In 1107 he rendered successful and distinguished service in the war against Bohemond in Albania.

John Kantakouzenos was a general with victories against the Serbs, Hungarians, and Pechenegs between 1150 and 1153 and was the military commander of Manuel I Komnenos (1143–80). He was killed in 1176 during the expedition of Manuel against the sultan of Ikonio (Konya). It has been suggested that he was a son or grandson of the above-mentioned Kantakouzenos but there seems to be no evidence to support this hypothesis.

Theodore Kantakouzenos was an opponent of the usurper Andronikos Komnenos (1183–85), who occupied the city of Nicaea. When Andronikos laid siege to it, in 1184, Theodore was captured and beheaded; his head was put on a pole, and displayed triumphantly in Constantinople. After his death the city came into the hands of Andronikos.

John VI Kantakouzenos became emperor of Constantinople (1341–54; see individual entry). His eldest son, Matthew Kantakouzenos, who was born around 1325, followed his father in the civil war against John V Palaiologos (1341/55–91). He was a remarkable soldier whose capabilities were fully understood and appreciated by his father. After the capture of Constantinople by his father in 1347 the army asked for him to be proclaimed heir to the throne. The proposal was not accepted and Matthew left with his supporters for Adrianople where he was given the title of co-emperor in 1353. In 1354 relations between Matthew and John V Palaiologos became strained and John V was forced to leave Constantinople and settle in Tenedos. Matthew was proclaimed emperor but his reign did not last long, because John V took over the city with Genoese support and Matthew retreated to Adrianople. He unsuccessfully fought the Serbs and in 1356 was captured by them. John V paid the ransom for his freedom and Matthew renounced any claim to the throne. In 1380 he became despot of Mistra after the death of his brother Manuel. He died there in 1383.

Irene Kantakouzene was the wife and empress of John VI Katakouzenos. The date of her marriage cannot be accurately determined, but it certainly took place before 1320. She is renowned for her courageous conduct in defence of Constantinople when her husband was abroad as well as for her ability to resolve differences between her eldest son

Matthew and John V Palaiologos. She became a nun after she and John VI Katakouzenos abdicated in 1354.

Helena Kantakouzene was the wife of David, the last emperor of Trebizond. After the fall of Trebizond in 1461 David and his family were shipped to Constantinople, where the whole family was executed apart from Helena. She ignored the sultan's order that the bodies should remain unburied to become the prey of dogs and crows, and secretly dug a trench in which she eventually buried them; a few days later she died.

Serban Kantakouzenos was the ruler of Wallachia (1679–88). The years of his reign are regarded as a landmark in Romanian history. He established institutions of higher education and committees for the translation of the scriptures into Romanian. His great dream was the liberation of the European countries that were occupied by the Turks. He organized a strong army and was recognized by Russia and Germany as the descendant of the imperial Byzantine family, destined to become the emperor of Constantinople after its liberation from the Turks. During the preparations for this he was poisoned by Boyars who were frightened that his plan would damage their country.

Alexander Kantakouzenos left Trieste to fight the Turks during the War of Independence (1821). He followed Demetrios Ypsilantis on his campaign in the Peloponnese and it was proposed that he should become commander of Crete. He refused this position, preferring to stay in the Peloponnese and fight the Turks. After the war he became a minister in the government of Mavrokordatos.

Georgios Kantakouzenos, born in 1837, was a prominent Romanian politician. He became minister of education in 1870. In 1889 he was elected president of the parliament and in 1892 president of the senate. After the leader of the conservatives died in 1899, he was elected president of the party and became prime minister of Romania, a position that he held until 1901. He was forced to resign because of the measures taken to restore the finances of the country. In 1905 he again became prime minister, but resigned because of his opposition to the distribution of land from the nobles to the peasants. He died in 1913.

Kapodistria, Count Ioannis 1776–1831

Russian diplomat and first president of the Greek republic

Ioannis Kapodistria was born on 11 February 1776 in Corfu into an ancient aristocratic Corfiote family, which had emigrated there from Istria in 1373. He studied medicine at the university of Padua, but when the Septinsular Republic of the Ionian islands was established in 1800, he became secretary of its legislative council. For the next seven years, in a series of offices, he played an influential role in the affairs of the islands. Early in 1807 he was appointed military governor, in charge of organizing the defence of Leucas against Ali Pasha, the practically independent sovereign of the Turkish province of Ioannina. It was then that Kapodistria first came into contact with Theodore Koloktronis, one of the future leaders in the War of Independence, and through him with early Hellenic nationalism. Throughout this period he was an ardent supporter of a Russophile policy, firmly believing that tsar Alexander I was the most reliable ally of the Greek cause. With the cession of the Ionian islands to France under the Treaty of Tilsit in 1807 such hopes were temporarily dashed.

Kapodistria maintained his connections with the Russian court, and in the same year accepted an offer to enter the Russian diplomatic service. Here his experience of the Near East stood him in good stead. By 1813 he had risen to the rank of councillor of state; he became one of tsar Alexander's most influential advisers. At the Congress of Vienna (1814–15) his influence was particularly conspicuous. Here Kapodistria, who in September 1815 had been promoted joint secretary of state for foreign affairs and governor of Bessarabia, was a vociferous advocate of the cause of the smaller nations in Europe, and he contributed significantly to the formulation of the final treaty of November 1815. Kapodistria's espousal of nationalism, however, raised the suspicions of Europe's leading statesman of the time, the Austrian state chancellor Prince Metternich. The overthrow of this "coryphaeus of liberalism" became vital for the success of Metternich's reactionary policies. Thus, when Kapodistria went on leave to visit Corfu in 1819, he was shadowed by the spies of the apprehensive Austrian.

In Vienna in 1815 Kapodistria had supported the creation of a British protectorate over the Ionian islands, the commercial advantages of which were apparent. Sir Thomas Maitland's robust administration of the islands, however, offended his local patriotism, and he decided to take up the issue with his imperial master in St Petersburg and with the British government. The latter, regarding Kapodistria's initiative as a pretext for Russian interference in what by treaty were wholly British affairs, gave him a cold reception. When he returned to Russia in the autumn of 1819 he found that here, too, his influence was waning. In court circles the "upstart Greek" had always been distrusted, but the murder of the Russian agent August von Kotzebue in 1819 and that of the Duc de Berry in the following year as well as the revolutions in Spain and Naples had shaken the tsar's liberalism, and thus undermined Kapodistria's position in the Russian government. By 1821 it had become untenable.

Alexander Ypsilantis's misguided and abortive raid into the Danubian principalities furnished Metternich with the long-sought opportunity to overthrow Kapodistria. Ypsilantis was the president of the secret revolutionary organization *Philiki Hetaireia*, of which Kapodistria was also a member. Metternich now insinuated that Kapodistria was bending Russian foreign policy to suit Greek ends. Anticipating his dismissal, Kapodistria resigned from his position in the

Russian government on the eve of the Congress of Verona in 1822.

For the next five years he withdrew into private life in Geneva. In April 1827, however, the Greek national assembly at Troezen elected him president of the Greek republic. His election marked a triumph for the Russian faction in the Greek national movement, as indeed Kapodistria had never ceased to regard himself as a Russian official. He accepted the new post but was in no hurry to take up the difficult task. In July he visited tsar Nicholas I; and having obtained the tsar's permission to proceed and being furnished with instructions as to the policy he should pursue in Greece, he went on a tour of the courts of Europe to gain moral and material support. It was only the news of the annihilation of Turkey's Egyptian fleet at the battle of Navarino in 1827, which practically meant the end of the War of Independence, that hastened Kapodistria's return to Greece. He arrived at Nauplia on 19 January 1828 aboard HMS *Warspite*.

The task awaiting Kapodistria was formidable: the finances of the new country were exhausted; it was economically backward; the great powers had placed restrictions on its sovereignty; and, most awkward of all, an undefeated Turkish army under Ibrahim Pasha was still in the southern half of the Morea. Kapodistria was an experienced politician; and he had the support of Russia. His diplomatic efforts to lift some of the restrictions on Greek sovereignty were to some extent successful, but his aristocratic background, his Russian proclivities, his arbitrary government, and his undisguised nepotism antagonized sections of the Greek body politic. Ultimately, his attempt to introduce the centralized Russian administrative system to Greece proved fatal. An open rebellion on some of the islands he was able to squash with Russian naval assistance. But his attempt to coerce the mountain clan of the Mavromichalis under Petros (or Petrobey) Mavromichalis, one of the leaders of the War of Independence, sparked an insurrection in Maina at Easter 1830. Although Petrobey was arrested and the uprising thus quelled, Kapodistria paid dearly for his attempt to enforce his rule on the country. He was murdered on 9 October 1831 on his way to church in a revenge attack for Petrobey's arrest by the latter's son Constantine. Kapodistria's assassination was followed by a state of anarchy which was ended only with the convention of London of May 1832 and the enthronement of prince Otto of Bavaria as king Otho of Greece.

Karaghiozis

Shadow puppet theatre

Karaghiozis is the Greek term for the shadow puppet theatre known in Turkey as *Karagöz* ("black-eyed"). The figures are usually constructed of thick cardboard on to which paint or coloured transparent paper is applied, or of very thin leather painted in various colours. They are highly ornamented, bearing scalloped edges, sequins, and glitter, so that the various elements that constitute the costume become clearly articulated. The figures are suspended from wooden guiding posts behind a white screen and they are lighted from behind, so that only their shadow touches the screen and creates a coloured illusion. There is a very simple stage set depicted on screen, constituted by the *Seray* (the vizier's mansion, or the sultan's palace), always located on the left side of the screen, and Karaghiozis's shack, always on the right side of the screen. Movement on screen originally occurred in only one direction, clearly demarcating the social space occupied by the various characters. Karaghiozis and the Greek characters exited from the right, whereas the Turkish characters exited from the left. With new techniques in the construction of the figures and the holding of the guiding poles, however, bidirectionality was introduced to the plays around the second half of the 20th century.

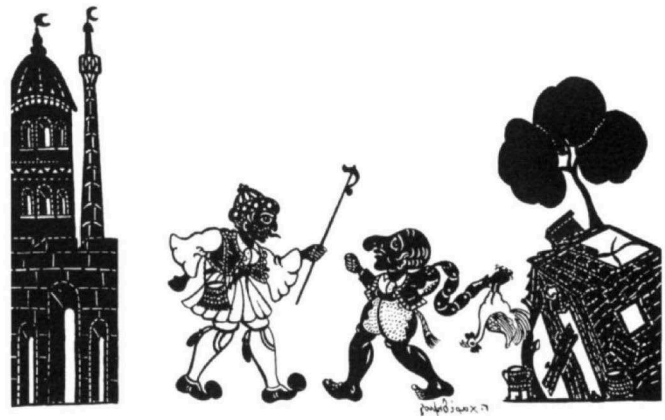
The origins of the genre are located in the religious and mystic theatre present in India, Indonesia, and China, although this particular genealogy is all but forgotten in the public discourses on shadow puppet theatre in both Greece and Turkey. The earliest written references to shadow puppet theatre are in the Indian epic *Mahabharata*, while in Java there are literary sources of the 11th century that mention shadow puppet theatre. Around the same time it also appears in Chinese texts. This tradition, however, consisted mainly of highly ritualized, philosophical, and stochastic texts that have little relation to the satirical, teasing, and profane elements that, in different combinations, constitute both the Turkish and the Greek versions of the tradition.

Although there is some debate as to when *Karagöz* first appeared in Turkey, it seems that the most plausible time was the 13th century. The Turkish chronicler Evliya Çelebi, writing in the 17th century, mentions, erroneously, that Karagöz was a messenger of the last Byzantine emperor Constantine XI Palaiologos, while Hacivat (the other main character) was a messenger of sultan Alâeddin. Although the character was known to the Greek inhabitants of Constantinople and other Ottoman urban centres of the Balkans from as early as the 17th century, *Karaghiozis* did not appear in Greece until the early 19th century, in the court of Ali Pasha in Ioannina. There, in 1809, we find the first references to performances of shadow puppet theatre by J.C. Hobhouse. *Karaghiozis* first appeared in Athens after independence, some time in the 1830s. The first specific reference to a performance is in Nauplia in 1841. We next find a reference to the establishment of an "oriental" (*asiatikon*) theatre in Plaka (Athens) in 1852. These performances were still very much Turkish ones, given by either Armenian or Jewish players, using profane language that was abandoned when the plays became "Hellenized". The content

of the plays and the adaptation of the supporting characters to Greek personae did not take place until the early 20th century.

The main characters in both traditions are Karagöz / Karaghiozis and Hacivat / Hatziavatis. Karagöz / Karaghiozis is a figure with exaggerated black eyes, of dark complexion, with a short, dark, and bushy beard, bald, stocky, and with a left arm that has one extra joint, making it one-third longer than his right arm. He was either a Turk, or a Greek, or a "Gypsy", and spoke in the vernacular, which he used very well, making extensive uses of linguistic tropes, in order to arrive at doubles entendres, which, when contrasted with his linguistic simplicity, provided the satirical element of the genre. Although perpetually jobless, he was always willing to do minor work and was available for little errands, which he always completed at the expense of Hatziavatis (in the Greek plays) or under the strict supervision and constant terrorization of Hacivat (in the Turkish plays). Karaghiozis was always depicted as being extremely intelligent and cunning and his main preoccupation was feeding his family and himself. He was dressed in rags, shoeless, lived in a shack directly opposite the palace, was married, and, in the Greek plays, had a legion of hungry children in tow, the most famous of which was Kolleteri. Hacivat / Hatziavatis was the sultan's messenger, a character with extensive encyclopaedic knowledge that ranged from the use of learned language in rhymed prose to the names of plants and spices, to music, and to Classical poetry which he could recite by heart. He had excruciatingly good manners and aspirations to high society. His figure was slim and he sported a small pointed beard. His demeanour was quiet and reflective, in stark opposition to the impulsive manners of Karagöz / Karaghiozis. Hadcivat / Hatziavatis was depicted as the keeper of the established order, the benefactor of the underprivileged, credulous and benevolent, whereas Karagöz / Karaghiozis was the innovator, the upsetter, and the trickster. In the Turkish plays Hadcivat was always the one who beat up Karagöz, but in the Greek adaptation the order (and the beatings) were reversed. These two main characters were surrounded by a cast of supporting ones, some of which are almost always present while others make only occasional appearances.

The supporting characters found in the Greek theatre are analogous to those found in the Turkish. The commonest of those are the various women who appear, or are referred to, regularly in the plays (such as Karaghiozis's wife and mother-in-law, the vizier's daughter, the women who come requesting his help); the various regional characters (Morfonios, who is a dwarf with strange manners but a womanizer; Sior Nionios, the Zantean; Stavrakas, the argot-speaking lumpen character from Athens; and, most importantly, Barba-Yiorgos, the mountaineer from western Greece, Karaghiozis's protector, who has no Western manners, sports no Western clothes, but is of the purest heart and intentions, in stark contrast to everyone else who is always trying to take advantage of Karaghiozis). Of the supporting characters only those of the pasha (or the sultan) and the vizier's daughter (*E Veziropoula* in the Greek plays) have been transferred unchanged, retaining their original titles (names do not appear with reference to these characters), occupying the space of law and authority. The pasha, the vizier, and the sultan rarely speak, whereas the vizier's daughter not only speaks but does so in perfect Greek and with a sweet voice.



Karaghiozis: the figures of Karaghiozis (right) and Hatziavatis are seen next to their respective dwellings, a shack and the sultan's palace

The representatives of authority, those who control it and delegate it, in the Karaghiozis plays are always depicted as mild-mannered and good-hearted, albeit obviously omnipotent, hence awe-inspiring. The characters, however, who draw Karaghiozis's mirth, ridicule, irony, and sarcasm are those who occupy the second tier of authority, those involved in the executive branch of the law, the messengers, such as Hatziavatis, and the policemen and the gendarmes, such as Velighekas and Dervenagas; also those who possess symbolic power by virtue of their profession, such as the doctor, the judge, etc. But if Karaghiozis was verbally, or even physically, abusive to those in power, he reserved and exhibited the utmost respect for the historical characters present in the plays. The Karaghiozis performers engaged in the rewriting of official historical events and characters for the benefit of their audience, in a manner that transcended historical time and space, joining popular lore with the memory of history. It is in this light that one should look at plays such as *Alexander the Great and the Cursed Snake*, *Karaghiozis and Captain Panourgias*, *Karaghiozis and Captain Greece*. The thematic appropriations extended into negotiations with and the subversion of the class structure (with plays such as *Karaghiozis the Millionaire*, *Karaghiozis the Admiral*, *Karaghiozis the Banker*), or, later, the management of the exotic and of change in the experience of everyday realities (such as in the plays *Karaghiozis the Astronaut*, *Karaghiozis the Soccer Player*, *Karaghiozis the Bullfighter*, *Karaghiozis's Divorce*).

Karaghiozis was initially performed within the informal and non-specific space of the *kafeneion* or empty lots (*alanes*). The performances were attended by a mixed audience of children and adults, an audience that, until *Karaghiozis*'s exoticism wore off, included members of the upper classes. With de-exoticization *Karaghiozis* was established as a genre of political and social commentary which was allowed to flourish because its criticism always operated under the disguise of comedy. By the middle of the 20th century, however, the genre had lost its political and social edge and had been safely appropriated as children's entertainment and transformed into a folkloristic item of slapstick comedy, prompting Yiorgos Ioannou's comment that the only audience of *Karaghiozis* nowadays are children and intellectuals. *Karaghiozis* lost its edge but retained the jerky, exaggerated movements, the struc-

ture of the play, and its musical and dancing form. The performances were eventually moved into open-air enclosures with masonry fences built around them (*mandres*), until they were finally moved spatially and symbolically into the area of tourism. From the beginning of the 20th century, with the introduction of the culturally Greek elements of the play, the shadow puppet theatre was supported by the parallel production of popular publications where the scripts of the various plays were published. With the advent of mass popular culture and the flourishing of a recording industry in Greece 45 rpm disks started being produced and distributed, followed by tape cassettes, and, lately, video recordings of performances, and books with Karaghiozis projects (such as "Build Your Own Shack").

NENI PANOURGIÁ

Summary

Karaghiozis (Turkish *Karagöz*) is the Greek term for the shadow puppet theatre and its eponymous main character. First appearing in Turkey (probably in the 13th century), the genre was not introduced to Greece until the early 19th century at the court of Ali Pasha of Ioannina. The repertory of plays combines folklore with satire and an element of history. By the mid-20th century it had become largely an entertainment for children.

Karaiskakis, Georgios 1782–1827

Greek commander in the War of Independence

Georgios Karaiskakis (born Karaiskos), destined to become a hero in the War of Independence, was raised in Epirus among the rugged mountains and valleys of western Greece. G. Finlay describes him as "of middle size, thin, dark complexioned, and haggard, with a bright expressive animal eye". Karaiskakis was accused of playing both sides of the fence in the war, and to some extent he did. One must remember, however, that at the outbreak of the war Greece was not a unified nation, and Karaiskakis was not the only person to change sides in the course of events. He was employed for a time by Ali Pasha, who ruled from Ioannina; he became a member of Ali's personal bodyguard, and was thus trained by the Turkish forces. When Ali Pasha died, Karaiskakis returned to the mountains and became the leader of a band of fighters and brigands known as *armatoles*. Subsequently he took part in the invasion of the Peloponnese in 1824 in which he fought against those Greeks who were fighting for independence. Ultimately convinced of the need to throw off the Turkish yoke, Karaiskakis therefore changed sides. In subsequent fighting he acquired a reputation for bravery which assuaged the doubts which some had about his loyalty.

Courageous and witty, Karaiskakis went on to fight in some of the most important battles of the war. He was at Krommydi in 1825, and also took part in operations at Messolonghi in August 1825. During the attempt to lift the siege of Messolonghi in April 1826, Karaiskakis was caught in an ambush by Turkish forces who effectively prevented his scheduled arrival. His absence from this operation contributed to the devastating defeat of the Greeks.

In the summer of 1826 Karaiskakis was named commander of the Greek forces by president Zaimis, and he immediately gathered some 2000 troops at Eleusis and marched off with the ultimate goal of lifting the siege of the Acropolis. He planned to do this in a series of battles, but his forces were defeated at the battle of Chaidari, and they withdrew to Boeotia. There he scored some successes, notably the defeat of a group of Turks at Arachova, but he was fighting on the fringe of the war. He returned to Attica, where the British admiral Church was now in control. Karaiskakis had been pushing his plan to cut off the supply lines of the Turks with a series of encircling battles. Church rejected that plan in favour of more direct action. Karaiskakis agreed to take orders from Church, and thus began the attack on the Acropolis.

On 25 April Karaiskakis took his men and marched toward the Acropolis. They met with great success: 13 outposts were captured on that one day. When they came to the monastery of St Spiridion in Munychia, they besieged the 300 Albanians who were holding the place. Attempts were made to negotiate an end to the siege, and it was Karaiskakis who finally persuaded the Albanians to come out. He did so by offering himself as guarantee for their safety. Thus when the gates were opened, the Albanians walked out with him in their midst. In spite of this, an altercation broke out and, disregarding the promise of safe passage, the Greeks slaughtered most of the Albanians. Karaiskakis was horrified, and reportedly called on the Albanians to shoot him, since he was their guarantee, but they were too busy trying to escape the melee. The incident is indicative of his character.

When he and his troops finally reached the Acropolis, the order was given for the battle to begin on 5 May. Accordingly, the troops were in place on the evening of the 4th. One of the Greeks in an outpost, however, fired on the Turks on the night of the 4th, and the battle was launched. Though ill in his tent, Karaiskakis crawled out to attempt to put a stop to the premature fighting. Unfortunately he advanced too far and became cut off from his troops. He was wounded, and died later that night. His death caused great dismay among the Greek troops, but he also became a rallying point for their defeat of the Turks.

Karaiskakis was a fighter of remarkable ferocity. His name was, in fact, proverbial among his enemies. One proverb asked, "Why do you run as though you were being chased by Karaiskakis?" He was clearly a man to be feared, yet he was also said to be a man of great wit. D.A. Zakynthos has written of him that, "In the character of this extraordinary man were present in full measure all those strange and vivid contrasts of light and shade, of baseness and nobility, which give to the actors in the story of the Greek revolt such remarkable dramatic interest".

As a martyr for the cause of freedom, Karaiskakis emerged from the War of Independence a popular figure. His popularity has not abated. In May 1997, to celebrate the anniversary of the storming of the Acropolis, a commemorative statue of Karaiskakis was unveiled on the island of Salamis in the main square of Salamis town.

Biography

Born in Epirus in 1782 with the name Karaiskos, he joined the staff of Ali Pasha in Ioannina. After Ali's death he became a brigand leader in the mountains and took part in the invasion of the Peloponnese in 1824. He then changed sides and in 1826 was named commander of the Greek forces in the War of Independence. He died in the siege of the Acropolis at Athens in 1827.

Karamanlides

The Karamanlides were one of the most interesting, yet poorly understood, groups of Orthodox Christians living under the Ottoman empire. They were Orthodox Christians who were Turkish in speech and constituted a significant portion of the Rum Milleti ("Roman Communities") within the Ottoman empire. They inhabited large areas of Asia Minor and portions of the Crimea as well as parts of Bulgaria and quarters of Constantinople. The Karamanlides were observed by outsiders as far back as the 16th century when the German traveller Hans Dernschwam wrote about the Turkish-speaking "Caramanian" Christians in the Yedikule quarter of Constantinople after his trip to the city in 1553–55. The Karamanlides played an important part after the Greek Revolution of 1821, when efforts were being made by the Greek kingdom to raise its sense of national consciousness. Before the 1923 population exchange as many as 400,000 Karamanlides lived in villages and small towns in Asia Minor in the regions of Nevshehir, Aksaray, Kayseri, Ihlara Vadisi, Peristrama, Ürgüp, Göreme, Derinkuyu, Nigde, Konya, Akshehir, Eregli, Ermenek, Ichel, Antalya, and Fetiye. Today, they make up a small religious community of no more than 80 to 100 people in Istanbul.

The origins of the Karamanlides are still an open matter. According to Greek scholars, the Karamanlides were originally Greek-speakers who adopted the Turkish vernacular either by force from their Muslim overlords or through their isolation from other Greek-speaking Orthodox Christians (who inhabited the coastal regions). The Karamanlides in this view are typically known as "Cappadocian Greeks". Turkish scholars view the Karamanlides as descended from Turks who migrated to Byzantine territories before 1453 and who only adopted the religion of their new rulers, but not the Greek language. The Karamanlides in this thesis are thought to have replaced the Pechenegs as mercenaries in the Byzantine armies and to have settled in the Kayseri and Karaman regions.

Up to 500 works of literature are thought to have been printed in the language of the Karamanlides, *karamanlidika*, by the beginning of the 20th century. These works used a modified Greek alphabet to represent Turkish sounds. For many Karamanlides, access to the Greek language was largely limited to the alphabet. One of the largest distributors of *karamanlidika* texts was the British and Foreign Bible Society, which published numerous editions of the Old and New Testaments. Other translations into *karamanlidika* included works by Aristotle and Confucius and Xavier de Montepin's novels.

There is still some debate as to which language was used for the Divine Liturgy. Some accounts report that Turkish was used throughout the liturgy while others state that Turkish was used only for the reading of the Epistle and Gospel. Preaching, however, was apparently done almost exclusively in Turkish owing to the limited knowledge of spoken Greek in some parts of central Anatolia. Discrepancies in travel accounts over this matter often arose from the traveller's inability to distinguish clearly between liturgical Greek and spoken Turkish, causing some to state that the whole service was performed in Turkish. Despite valid reasons for the existence of a liturgy written in *karamanlidika*, none has been found to date.

A strange example of the interaction between the Karamanlides and the Greek-speaking Orthodox Christians was the case of Papa Eftim (Efthymios Karahisaridis). Papa Eftim, a Karamanli, was ordained priest in 1915 for the town

of Keskin in central Anatolia. He was openly hostile to the Ecumenical Patriarchate at the Phanar and had ideas about further Turkifying the Anatolian Orthodox (which were consistent with Kemalist aims). On 15 September 1922 he declared the establishment of the Turkish Orthodox Church at St John's at Zincirdere, Kayseri. His hopes for a viable Turkish Orthodox Church came to a complete stop with the mandatory exchange of populations, but he was able to remain in Turkey by demonstrating his pro-Turkish activities during the war between Greece and Turkey. Papa Eftim then looked towards the Karamanlides in Istanbul (who were not affected by the exchange of populations). This too proved to be useless since the Karamanli community there was firmly attached to the Phanar and the mainstream Greek community of the city. Nevertheless, Papa Eftim travelled to the Phanar on 28 September 1922 where he was very outspoken about the need to elect a Turcophone patriarch who would have a "Turkish heart" and not speak rebelliously against the new Turkish state. On 2 October 1922 Papa Eftim and his Turkish allies stormed the Phanar and caused the deposition of Patriarch Meletios by the Holy Synod. Papa Eftim then made himself the Patriarchal representative in Ankara, only to be dismissed later by the Turkish government on 12 October 1922 on the grounds that religious institutions had no place in the new secular government. Papa Eftim was labeled "mad" by the newspapers at the time.

Karamanlidika inscriptions are found at many cemeteries in Turkey, the largest number being at Balikli (outside the city walls of Istanbul). The inscriptions often talk about the humble origins of unimportant craftsmen from central Anatolia. According to Clogg (1978), they offer a "glimpse of a long past world of Greek and Turkish symbiosis".

MARK A. COUMOUNDUROS

Summary

The Karamanlides were Orthodox Christians who spoke Turkish and lived under the Ottoman empire. They were to be found in many parts of Asia Minor as well as in the Crimea, Bulgaria, and Constantinople. It is uncertain whether they were originally Greek-speakers who adopted the language of their rulers or Turkish-speakers who moved to Byzantine territory before the fall of the empire and adopted the religion, but not the language, of their masters. Today they comprise a tiny religious community in Istanbul.

Karamanlis, Constantine 1907–1998

Politician

A statesman who listened to the singular voice of politics his whole life, Constantine Karamanlis is best remembered as the man who was chosen to lead Greece out of the darkness of dictatorship in the mid-1970s and as the prime minister who secured Greece's entry into the European Economic Community in 1981. His political career ebbed and flowed for the better part of the 20th century – a time of much institutional upheaval and social duress for Greece – yet despite prolonged retrenchments during some of the worst of times, it lasted into his autumn years. For this he can be called a true political survivor, but one whom history has yet wholly to assess.

Karamanlis was born on 8 March 1907, an Ottoman subject in the Macedonian town of Proti, which was not liberated until the Balkan Wars. As a young boy he worked in his father's tobacco fields. These were formative years, in which he experienced the hardships of farm life and the demands of duty. But he had the privilege of a good education: at the age of 16 he was sent by his father, a schoolteacher, to Athens. Two years later, in 1925, Karamanlis entered Athens University to study law. Though known as rather a loner, and suffering from a developing and socially impeding hearing problem, he nevertheless formed lasting friendships and secured political patronages. After serving for a brief period in the army, Karamanlis set up his own law practice in the town of Serres. With a growing awareness of his own political philosophy, valuing stability over revolution, his political aspirations grew and in the general elections of June 1935 he won election as a deputy under the Popular Party. With the dissolution of parliament under General Metaxas a year later, Karamanlis found himself jobless. He kept a low profile during the dictatorship and rather than publicly oppose the regime, as did some of his contemporaries, he returned to his law practice in Serres. He remained politically inactive through World War II and the German occupation of Athens. It was not until 1946 that he resumed parliamentary activity, under the Popular Party government of Constantine Tsaldaris.

Karamanlis held a number of parliamentary posts, including that of minister of social welfare (1948–50), in which he gained recognition in his handling of the repatriation of war refugees through a welfare-work programme, and later as minister of public works, demonstrating his ability to achieve results and laying the groundwork for the development of Greece's infrastructure. On the death of Marshal Papagos in 1955, Karamanlis, much to the chagrin of his competitors who decried the appointment as favouritism, was made prime minister by king Paul I. The following year, wishing to dissociate himself from the far right and shake off accusations of complicity with the United States, Karamanlis formed the National Radical Union, cleverly adopting the titulary nomenclature of the left.

His transformation of the Greek economy and plans for modernization have left an indelible mark on the Greece of today. His role in the creation of the Republic of Cyprus in 1960, which detractors like to consider problematically derived too, was another of his achievements. Despite Karamanlis's animosity towards the palace and what he considered its meddlesome role in politics, his tenure as prime minister was generally successful. Not suprisingly, procedural ambiguities in the 1952 constitution occasioned ever deepening rifts between Karamanlis and the king, and in 1963, shortly after the assassination of a left-wing deputy by right-wing extremists, and a row between Karamanlis and the king over the latter's impending visit to Britain, Karamanlis left politics and exiled himself in Paris. Karamanlis, though somewhat authoritarian but never quite the strong rightist his critics considered him to be, spent most of his political life trying to distance himself publicly from extremists. He was never implicated in the assassination of the deputy, though some found the coincidence of his self-imposed exile shortly in its wake highly suspicious. For 11 years, mostly during the dark years of the dictatorship of the colonels (1967–74), Karamanlis again withdrew from politics, absorbing, perhaps, the principles of Gaullism, which were to guide him upon his return to Greece in 1974.

Karamanlis made a triumphant return to Greece and to politics. As prime minister under New Democracy, the centre-right party that he founded, he quickly embarked on a programme of dejuntification, reinstated the Communist Party (outlawed since 1947), democratized political institutions including revision of the constitution, put the question of the monarchy to referendum, and returned Greece to the international community. His premiership came to an end with the victory of the Socialists under Andreas Papandreou in 1981, though Karamanlis continued in the role of president. Papandreou's second term, which began in 1985, brought about constitutional amendments and diminished support for Karamanlis to serve a second term as president, despite his impeccable conduct in that post. Papandreou sought to limit the powers of the president, which had been allocated in a constitution of Karamanlis's design. Karamanlis, who so easily in the past had abandoned politics, withdrew again, leaving Papandreou to amend the constitution.

In 1990, and at more than 80 years of age, Karamanlis again rejoined the political fray, serving as president with his own party, New Democracy, in power. He retired from political life at the end of his term five years later. Karamanlis died on 23 April 1998, at the age of 91.

BARBARA SYRRAKOS

Biography

Born in 1907 in the Macedonian town of Proti, Karamanlis studied law at the University of Athens. He first served as a deputy in 1935–36. He re-entered politics in 1946 and became prime minister for the first time in 1955–63. In 1963–74 he went into voluntary exile in Paris. He served again as prime minister in 1974–81 and as president in 1981–85 and 1990–95. He died in 1998.

Kassia

Poet and composer of liturgical music in the 9th century

Popular to the present day for her liturgical poetry and for the legends surrounding her life, the 9th-century nun Kassia is one of a handful of Byzantine women known to have written musical works for liturgical use. She is the only woman whose hymns were transmitted widely in manuscript – where they often appear under such variants of her name as Eikasia, Ikasia, and Kassiane – and were later included in the printed service books of the Orthodox Church. Kassia is also exceptional in that, unlike other Byzantine church musicians of comparable accomplishment, such as Kosmas of Maïouma or Joseph the Hymnographer, she was never canonized.

In the absence of a *vita*, scholars have gleaned information about her from several sources. Letters by St Theodore the Stoudite to a young Kassia reveal her to have been the daugher of a Constantinopolitan courtier, to have received a good literary education, and to have been from her youth a zealous defender of icons. Her early devotion to God and the iconophile cause must have been remarkable, for in one instance the fiery Theodore reproved her for dealing too harshly with an iconoclast, and in another counsel led her to postpone a decision to embrace monasticism. She seems to have followed his advice, for the writings of St Symeon the Logothete (10th century) describe Kassia's participation in a bride-show for the emperor Theophilos. According to Symeon, after a witty reply to a question posed by the emperor lost her the opportunity to become empress, the beautiful Kassia became a nun. Although some scholars have questioned the authenticity of Symeon's account, others have noted that his description of Kassia's character corresponds well with the intolerance she displays in her series of iambic sentences beginning with the phrase "I hate". These contain a denunciation of an illiterate young man of royal blood that may be a reference to Theophilos. She is reported to have founded a monastery on the Constantinopolitan hill of Xerolophos after the final restoration of icons in 843, dying at some point during the reign of Michael III (842–67).

Kassia wrote non-liturgical poetry, of which 261 verses of epigrams and gnomic sentences survive, on a variety of social and ethical themes, including fortune, luck, friendship, women, and social customs. She is, however, primarily remembered for her work as a *melodos*, a hymnographer who composed her own melodies. While only 23 of the 49 hymns attributed to Kassia in manuscripts are regarded by scholars as genuine, there are reasons to suspect that she may have written some of the remaining works of doubtful

attribution. Theodore Prodromos (*c.*1100–*c.*1170?), for example, notes that her authorship of a four-ode canon for Holy Saturday was later obscured through reattribution to Kosmas of Maïouma by authorities who thought it unseemly to feature compositions by a woman on such a solemn occasion. This *tetraodion* – which was rewritten at the command of Leo IV, the Wise (886–912) with the addition of the missing odes necessary for a full canon – is the better of her two known canons. The other, a massive 252-verse canon for the dead, is her only genuine work not included in modern service books.

Unlike her prolific contemporary St Joseph the Hymnographer, who wrote mainly canons, Kassia is distinguished by her cultivation of the *sticheron*, a monostrophic genre encompassing all the 47 remaining hymns firmly or doubtfully attributed to her. Written for performance between the verses of the fixed morning and evening psalms of Palestinian monastic matins and vespers, these *stichera* include texts set both to pre-existing tunes (*prosomoia*) and to melodies of her own composition (*idiomela*). It is in the latter that Kassia's genius as a *melodos* is most apparent, for the best of them, as Touliatos has shown, combine expressive texts with finely crafted music. Her *sticheron* for the vespers of Christmas "When Augustus Reigned" emphasizes the parallels drawn in its text between political unification under the Roman empire and the union of all humankind in Christ with a sequence of paired musical phrases employing the same melody for the human and the divine. Kassia's most famous composition is her *sticheron* for the matins of Holy Wednesday on the sinful woman in St Luke's gospel (7: 36–50). In marked contrast to Romanos's treatment of the woman as a stereotypical prostitute, Kassia identifies strongly with her subject. After briefly introducing the sinful woman, she casts the remainder of the *sticheron* as a dramatic monologue of repentance that Topping has likened to a penitential psalm. The hymn's emotional text is reflected by music that comes to rest in a variety of modal areas over an unusually wide vocal range.

From Byzantine times until the present day the musical works of Kassia have been held in high regard. Nikephoros Kallistos Xanthopoulos included her as the only woman in his 14th-century catalogue of hymnographers, and succeeding generations of Byzantine cantors have continuously adapted her works to suit contemporary musical tastes. Kassia's hymn on the sinful woman, which for modern Greeks has become one of the high points of Holy Week, provides the best example of this process. Chant versions of this sticheron still today range from the florid but restrained 18th-century setting of Petros Peloponnesios in the old sticheraric style to virtuoso showpieces by more recent cantors. From the latter half of the 19th century Kassia's hymns have also been set polyphonically by such composers as Themistokles Polykrates, Mikis Theodorakis, Tikey Zes, and John Vergin.

Even though Kassia was never canonized, her life soon entered into the realm of popular legend. Two episodes in particular have captured the imagination of subsequent generations: her participation in the imperial bride-show, the story of which was progressively embroidered; and a presumably apocryphal tale of how Theophilos paid a clandestine visit to her monastery while Kassia was composing her hymn on the sinful woman – with whom she was increasingly indentified in the popular imagination – and added several lines to its text after she fled from his presence. Variations on these legends form the basis for modern Greek poems, novels, stories, and plays by D. Bernardakis, A. Stamatiades, A. Papadopoulou, A. Kyriakos, M. Roussos, and others. Paraphrases of her hymn for Holy Wednesday have also been written by poets including Kostis Palamas, whose version was set to music by D. Mitropoulos.

Kastoria

City in western Macedonia

Kastoria is unique in that it contains a remarkable number of Byzantine and post-Byzantine monuments which bear witness to the prosperity it knew in the past and the role it played as a cultural centre. Kastoria emerged in the Middle Ages and has had a continuous life up to the present day. The town is built beside Lake Orestias (or the Lake of Kastoria), on the slopes of a hill next to a rocky promontory which juts out into the lake.

Present-day Kastoria probably has its origins in the 9th century AD as is suggested by the dating of its earliest churches, St Stephen and the Taxiarchs, and by the dating of its external walls. The earliest record of the town in a literary source appears in the *History* of John Skylitzes and is related to events of the year 976. The site where Kastoria stands was settled twice before the 9th century. The first settlement was known as

Kastoria: the city viewed from across Lake Orestias. Flat-bottomed fishing boats, built to an ancient pattern, are peculiar to the lake.

Celetrum (Keletron) and is recorded by Livy in connection with events in 199 BC. The same site was resettled in the 6th century AD by order of the emperor Justinian I. According to Procopius, who provides this information, the lake was already known by the name of "Kastoria". There is no other reference to the Justinianic settlement, which may have lain deserted in the 7th and 8th centuries.

The conditions under which the site of Kastoria was resettled in the 9th century are typical of the gradual restoration of Byzantine rule in the Balkans that took place from *c.*900 onwards. The Byzantine authorities had a special interest in resettling strategic points which could then serve as fortified centres for the provincial administration, and Kastoria occupied an excellent position. The town proved to be strongly defensible by nature, for its access by land was very limited, and it was protected by strong walls. Furthermore, Kastoria lay in a key position for the control of important routes in that part of the Balkans, such as the one which followed the course of the Haliacmon and Devol rivers leading from Macedonia to the port of Avlon on the Adriatic coast. Another axis, in a southerly direction, led from Kastoria to Thessaly. The strategic importance of Kastoria was proved on several occasions, particularly during the wars between Byzantium and the Bulgarians in the years 976–1018, and during the Norman invasion of 1081–83 when the town was occupied by the Normans and used as a base for launching subsequent operations in western Macedonia and Thessaly.

The development of the medieval town began after the restoration of Byzantine rule, in the year 1018, and culminated during the 12th century, a peaceful period which marked the highest point of prosperity for Kastoria in the Middle Ages. This was the formative period which produced the principal socioeconomic and cultural characteristics of the town lasting into the modern era. The ecclesiastical history of Kastoria is also important. As soon as the Byzantines established the archbishopric of Bulgaria (based in Ohrid) with authority over the areas which they conquered or reoccupied after the wars of 976–1018, the Church of Kastoria was given first place in the hierarchy. The bishop of Kastoria remained the first in rank (*protothronos*) among the subordinates of the archbishop of Bulgaria until the archbishopric was abolished in 1767. After that year, the Church of Kastoria was upgraded to the rank of a metropolitan see and was directly controlled by the Patriarchate of Constantinople.

The development of the town began with the establishment of secular and ecclesiastical authorities and continued with the emergence of a local group of wealthy landowners who held rural estates in the surrounding region. The presence of this

group stimulated the development of the town's trade and handicrafts. However, although Kastoria became a centre of commercial and artisanal activity, its economy remained fundamentally rural during the medieval and early modern periods. The population of the surrounding countryside was mainly engaged in cereal cropping, viticulture, and livestock raising, while the practice of keeping vineyards was also common among the townsfolk. Some of Kastoria's inhabitants took advantage of their proximity to the lake and became involved in fishing, which added considerably to the local economy. Information about the town's population and economy is provided by a fiscal register drawn up *c.*1445, about 60 years after the Ottoman conquest of the town (which took place in 1385 or 1386). According to the register's data, 22.30 per cent of the fiscal revenue that was raised from the town represented commercial taxation, another 22.79 per cent represented fishing, while 24.03 per cent came from the tax on vineyard production and 20.72 per cent from land-usage taxes. At that time Kastoria was inhabited by approximately 4518 people, who were distinguished as 3977 Christians, 431 Jews, and 110 Muslims. In 1519 approximately 4815 people are recorded as resident in the town, 4480 Christians and 335 Muslims. In fact, the Muslims of Kastoria were a minority of the local population and remained so during the five centuries of Ottoman rule, in contrast to other towns of Macedonia, such as Thessalonica, Giannitsa, and Serres, where they made up a large part or even the majority of the population.

Kastoria is renowned for the history and cultural tradition of its Jewish inhabitants. The history of Kastorian Jewry falls into two distinct phases, the Romanite and the Sephardic. The Romanite community of Greek-speaking Jews existed in Kastoria during the Middle Ages until they were transferred to Constantinople in the years after 1453. A Sephardic group of Jews settled in Kastoria sometime during the 16th century, certainly after 1519, for that year's registers contain no reference to them. The modern-day Jews of Kastoria descend from the later settlement; they remained an important element of the town's population until the years of the German occupation of Greece (1941–44), when most of them were driven to concentration camps.

The profession which has been practised in Kastoria for centuries and has made the town famous is fur manufacture and trading (*kastor* means "beaver" in Greek). The first record of fur manufacture in Kastoria is contained in the aforementioned fiscal register of *c.*1445, yet it already seems to have been a well-established practice. In later centuries, Kastorian fur traders expanded their business all over the Ottoman empire, to central and western Europe, and finally established their agencies in the USA in the 20th century, bringing great wealth to their town.

The economic development of Kastoria had a profound effect on local artistic production. In fact, there are more than 40 Byzantine and post-Byzantine monuments surviving there, far more than in any other town in Greece, and they provide good evidence for the study of local patronage. The foundation and decoration of these churches were undertaken by local landowners such as Theodoros Lemniotes, who paid for the renovation and redecoration of the church of Sts Anargyroi, and Nikephoros Kasnitzes who founded a church of St Nicholas in the 12th century. Equally, the earliest surviving mansions, which include the finest examples of secular architecture in Macedonia, date from the 15th and 16th centuries. After the Ottoman conquest and the subsequent collapse of the Greek landowning class, the patronage of culture and the arts fell to the wealthy Kastorian merchants. Most notable among them were Georgios Kyritses and Manolakis Kastorianos (the latter was a prominent fur trader based in Constantinople), who, as part of their various donations, subsidized the establishment of Greek education in the town. The school that was founded in Kastoria in 1614 was the oldest Greek school in Macedonia. Another school was founded in 1705 and a third one in 1715 on the endowment of Georgios Kyritses.

This long-standing cultural tradition resulted in the formation of a strong national sentiment among the population of Kastoria during the years of nationalistic conflict in the late 19th and early 20th centuries. In this respect, Kastoria became the principal centre for the Greek cause in western Macedonia. Most active among the Greeks of Kastoria was the metropolitan Germanos Karavangelis, who organized the first Greek militias, igniting the struggle for Macedonia.

Kastoria was occupied by the Greek army in 1912, during the first Balkan War, and was formally annexed to Greece in 1913. Present-day Kastoria is a small provincial town but a particularly wealthy one due, primarily, to its fur trade and, secondly, to tourism, as the physical attractions of the place and the fame of its surviving medieval monuments attract many visitors.

KONSTANTINOS P. MOUSTAKAS

Summary

Kastoria lies astride important land routes in western Macedonia. According to Livy, a town called Celetrum occupied the site in the 2nd century BC and this was resettled in the 6th century. The present town dates from the 9th century, as do its earliest churches and walls. There was an important Jewish community until the 1940s. The fur trade has been practised since the 15th century.

Kavalla

Port in eastern Macedonia

In contrast to other towns of Macedonia which clearly have a medieval past, collective memory of Kavalla extends only as

far back as the period of Ottoman rule. This does not, however, reflect the true situation, since the site was settled in antiquity. The ancient predecessor of Kavalla, Neapolis, was a colony of the Thasians, on the coast opposite their island, and existed at least as early as the 5th century BC, when it was included in the tribute lists of the Delian League. The site combined several geographical and strategic advantages. First, it controlled the narrow pass between the Lekani mountains and the sea which the land route from Macedonia to Thrace (the ancient Via Egnatia) necessarily had to pass through. Second, it provided access to and control of the gold-mines of Mount Pangaeum and the productive plain of Philippi/Drama. And third, it served as an outlet to the sea for the products of those regions. The importance of Neapolis was underlined when it served as the port of Philippi, 15 km to the northwest, throughout its long period of prosperity. Neapolis was renamed Christoupolis, probably in memory of St Paul's disembarking there as he began his tour in Macedonia. By the 9th century the ancient name of Neapolis was probably completely forgotten.

Medieval Christoupolis declined rapidly in the later 14th century and this can be associated with the fighting that accompanied its capture by the Ottomans (*c.*1382–83), though other reasons, such as the plague, may have played a part. The final blow was dealt when the town was raided and sacked by the Venetians in 1425. The traditional view of a deserted Christoupolis which remained so until it was resettled as Kavalla in the 16th century is mainly based on a description by the Italian Angiollolo who passed by the town in 1470 (Mertzios, 1947, pp. 117, 201–03). Nevertheless, new evidence that comes from the study of Ottoman registers suggests otherwise. Kavalla is first recorded in 1478/79 as forming part of the administrative district of Drama and being inhabited by approximately 475 people (315 Christian, 60 Muslim). By 1519 the Muslims had risen to 110 with the Christians remaining around 355. These figures are not high enough to present Kavalla as a town, but they are not negligible and show clearly that Kavalla was not a deserted place in the 15th and early 16th centuries. The town's Christian inhabitants are described by the French traveller Pierre Belon, who visited the area in the mid-15th century, as Greek (Belon de Mans, 1553, Paris 1553, p. 57). Therefore, Kavalla can be regarded as a continuation of medieval Christoupolis, for the town's site was never fully abandoned during the period of transition. Yet, this is not just a question of continuity in settlement, but one of social, economic, and institutional transformation, for much of what had characterized medieval Christoupolis was absent from early modern Kavalla. Commercial activity was disrupted, the town's church was reduced (there is no longer any record of the medieval bishopric of Christoupolis), and early Ottoman urban institutions were not extensively developed, so Kavalla was partially administered from Drama.

Kavalla's development began during the third decade of the 16th century and has continued to the present. This development was based on the same conditions that allowed for the previous prosperity of Neapolis and Christoupolis, namely its strategic location and also the facilities it offered for the export of the region's products by sea. Kavalla's revival is associated with the efforts of the Grand vizier "Frenk" Ibrahim Pasha (1523–36) who had shown a particular interest in the town. Those years are marked by significant building activity, most notably by the construction of the town's aqueduct (later known as *kamares*, one of its attractions today) and of several mosques.

The population of Kavalla increased too through the introduction of new settlers, mainly Muslims. The town's Muslim population has a long history starting in the 15th century and continuing until 1923 when they departed in the exchange of populations between Greece and Turkey. A well-known representative of Kavalla's Muslims is Mohammed Ali, an ethnic Albanian, who first became governor of Ottoman Egypt and then independent ruler of the country and founder of the dynasty that reigned there until 1952. Evliya Çelebi provides information on Kavalla for the second half of the 17th century. He describes a town consisting of five neighbourhoods with 500 households in total (this corresponds to a population of at least 2500 people), and with several mosques, religious colleges (*madrasas*), and houses for the poor (*imaret*). The commerce of Kavalla increased further in the 18th century when the town was used as a point of export for the products of eastern Macedonia (grain, cotton, tobacco, etc.). Many European merchants, mainly French but also English, Dutch, Venetians, and Ragusans, were active in Kavalla, where the post of French deputy consul was in operation in the middle years of the century; later on, official representation of France was re-established there by the appointment of an agent of the French consulate of Thessalonica in 1791.

As far as the intellectual and cultural life in the town is concerned, the Muslim community seems to have been in a better position than the Christian one. According to Evliya Çelebi, several mosques and religious colleges were in operation, but there are no records of any significant intellectual activity concerning the local Christians before the 19th century, in contrast to what was usual among the Greek communities in most towns in Macedonia. Greek schools were not founded in Kavalla until the 19th century. Moreover, the town's church was given a low rating until the 19th century, when it was elevated to the rank of a metropolitan see. Like other towns in Macedonia with strong Muslim communities, the Greeks of Kavalla took no action during the Greek War of Independence, unlike those of the nearby island of Thasos who were urged to rebel by some of their compatriots, members of the *Philiki Hetaireia* (Friendly Society). The revolt of the Thasians lasted from June to December 1821 and was terminated without fighting, as they accepted Ottoman terms for surrender.

Kavalla's development in the 19th century is marked by the predominance of tobacco trading which resulted in the industrialization of the town. Several companies engaged in tobacco processing emerged in Kavalla during the 19th and early 20th centuries, due to increased production in the countryside and growing market demands. This made Kavalla one of the few significant industrial centres in the late Ottoman empire. Also in the 19th century the residential quarters expanded towards the harbour, while in previous centuries they were confined to the slopes of the hill below the medieval citadel of the town.

Ottoman rule in Kavalla ended in 1912 as a result of the First Balkan War. The town was first occupied by the

Bulgarians, who were soon driven out by the Greeks, and Kavalla was officially annexed to Greece in 1913 according to the provisions of the Treaty of Bucharest. Nevertheless, the history of Kavalla remained turbulent during the whole first half of the 20th century. One reason for this was Bulgarian irredentism, for Kavalla was regarded as an outlet to the open sea for that country; in fact, the Bulgarian army occupied Kavalla twice, during both world wars, first between 1916 and 1918, and secondly between 1941 and 1944, as a result of Bulgaria's alliance with Germany. Furthermore, between the World Wars, Kavalla was a bed of intense social unrest due to the radicalization of its many tobacco-factory workers. It was also a stronghold of the Greek communist left in those years and still has a reputation for being among the birthplaces of the Greek labour movement.

In the postwar years the tobacco industry has declined in Kavalla. The town still has a considerable amount of industry (fertilizers, food processing, and tobacco processing to some extent) but this cannot be compared to prewar levels. The decline of Kavalla's industry has been counterbalanced by the development of other sectors (e.g. services, tourism), while the population of the town has grown continuously to make it the second largest city in Greek Macedonia, after Thessalonica, and the largest in east Macedonia (56,571 people in 1991). In conclusion, what mainly characterizes the history of Kavalla is its many similarities to Thessalonica as well as its differences from the other towns of Macedonia which retained a traditional economy of medium-scale commerce serving local demands.

KONSTANTINOS P. MOUSTAKAS

Summary

Originally colonized by Thasos and known as Neapolis, the city lies on an important land route (the Via Egnatia) and provides an outlet to the sea for the gold of Mount Pangaeum and the products of the plain of Philippi. Known as Christoupolis in the Middle Ages, the town declined but recovered again in the 16th century. It was an important centre for the tobacco industry.

Kazantzakis, Nikos 1883–1957

Novelist

Everything about Nikos Kazantzakis has been controversial. During his lifetime, his politics and religiosity were most in question. Now, more than 40 years after his death, one still wonders whether he contributed anything to the Hellenic tradition. Many Greeks considered (and consider) him anti-Hellenic owing to his eager absorption of French and German philosophy (chiefly Bergson and Nietzsche), Eastern religion (chiefly Buddhism), and the literary influences of D'Annunzio, Ibsen, and Dostoevsky, among others. They worry, for example, because his retelling of Homer's *Odyssey* turns Homer inside out in ways they consider quintessentially non-Greek. Yet the opposite view is equally compelling. After all, Kazantzakis chose the Homeric hero to exemplify his own modernist views, changing that hero substantially, it is true, but nevertheless extending one of Hellenism's central myths. In addition, Kazantzakis reworked other ancient Greek materials (e.g. Melissa, Theseus and the Minotaur, Prometheus), Byzantine subjects (e.g. Constantine Palaiologos, Nikiphoros Phokas), revolutionary ones (e.g. Kapodistria), as well as basing novels on Greece's ill-fated expedition into Asia Minor and on its civil war. Like his colleagues George Seferis, Yiannis Ritsos, and Odysseus Elytis, he considered Greek culture a seamless continuity from Homer to the present, and he enhanced that continuity by his conviction that ancient, medieval, and 19th-century Greek literature can speak meaningfully to contemporary audiences.

In addition, Kazantzakis concentrated on Christianity, the other great influence upon Greek civilization. His religiosity was condemned as blasphemous by many Greek Orthodox prelates (very few of whom read the books they were condemning); recently, however, his theology has been greatly appreciated, at least outside Greece, for its pioneering application of "process". As for his politics, he was vilified by right-wingers in Greece as a communist (unjustly) and by Greek communists as an "idealist" (justly). All in all, the various forms of controversy, even though they often made publication difficult and forced him into voluntary exile, seemed not to discourage him but rather to make him more energetic. His basic philosophy placed "struggle" at the centre of the creative life and his circumstances made struggle his ever-present situation. Hence, calamity only prodded him all the more to persevere in creative productivity.

Most people know Kazantzakis through his novels. But he produced these late in life and always considered them secondary. Primary for him were drama, poetry, and religious philosophy. By 1923, at the age of 40, he had formulated his definitive credo – *Askitiki: Salvatores Dei* – based on humanity's obligation to "transubstantiate matter into spirit" by struggling within the material world. His earlier works moved from fin-de-siècle aestheticism to religious pessimism and then

to vibrant nationalism. In post-1923 works the credo governs everything as protagonist after protagonist succeeds or fails, wholly or partially, to transubstantiate. The hero who fares best of all is Odysseus in Kazantzakis's gargantuan sequel to Homer's *Odyssey*, written between 1925 and 1938. But figures such as the hero of *The Life and Times of Alexis Zorbas* (composed in the dark days of the German occupation of Greece, 1941–43) and especially priest Fotis in *Christ Recrucified* also progress far along this path.

The plays, many of which are still not translated, show Kazantzakis's eclectic reach beyond Greek subjects. The sardonically entitled *Comedy: A Tragedy* projects his loss of religious faith. *Buddha* examines Western philosophies of action and achievement in relation to Buddhistic resignation. *Christopher Columbus* has its protagonist turn back as soon as his crew sights land, owing to Kazantzakis's conviction that aspiration is holier than achievement.

But Kazantzakis' greatest contribution is perhaps his struggle with the Christianity in which he could no longer believe. Determined none the less to retain Jesus as the exemplar par excellence of the effort to transubstantiate matter into spirit, he treated this hero in a play, a long poem, and finally in the novel *The Last Temptation*, which retells the gospel story in a manner offering happiness as Jesus' (and our) most serious impediment. The book aroused heated opposition both in its own right and in its cinematographic form (Martin Scorsese's *The Last Temptation of Christ*, 1988); yet Kazantzakis's determination to reinvent a Jesus who can speak to, and function in, a world governed by Darwinian process has been welcomed by many religious thinkers of liberal persuasion.

Besides the numerous plays, the huge *Odyssey*, and the well-known novels, Kazantzakis produced a series of very popular travel books, a history of Russian literature, two novels written in French, a dissertation on Nietzsche, an updated Platonic "Symposium", and numerous children's books, besides translations of the *Divine Comedy*, *Faust*, and (with Professor Ioannis Kakridis) Homer's *Iliad* and *Odyssey*. He also left thousands of letters, many of which are now published; indeed, he may be one of the major epistolographers of his period.

Virtually unknown outside Greece until the late 1940s, when *Zorba* won a literary prize in France, Kazantzakis became an international celebrity in the 1950s, his novels translated into all major languages. He and Constantine Cavafy are the best-known modern Greek authors outside Greece. This does not mean, however, that Kazantzakis has always been celebrated inside Greece, although he has always appealed greatly to youth there, as elsewhere. His international vogue subsided in the 1980s. In the late 1990s, however, interest in him – chiefly as a religious thinker, but also as a novelist grappling with political, religious, ethical, and philosophical quandaries – revived. In conclusion, he can perhaps be described as an "acquired taste", somewhat like D.H. Lawrence, whose frenzy, wordiness, and almost pathological intensity he shared. His exuberant, adjective-filled prose is repugnant to readers trained in the laconic restraint of certain modernist writers in Greece and elsewhere. But his engagement with the major carnal and spiritual problems of the mid-20th century is so energetic, prophetic, and (ultimately) optimistic that he still speaks meaningfully to many readers.

Biography

Born in Herakleion, Crete, in 1883, Kazantzakis studied in Athens and Paris. He was influenced by the philosophy of Henri Bergson and Nietzsche and was early involved in politics and the language question. He wrote plays, poetry, philosophy, travel books, and, only later in life, novels. He died in 1957.

Kinship

The Greek words for "kin", *syngeneis*, and for "relationship", *syngeneia*, are compounds of the preposition *syn* and the word *genos*, whose usage is manifold in Greek to denote "genus", "category", "lineage", "family", "generation", "stock", etc. *Syngeneia*, then, means "common stock, generation, or lineage". The term, in its broadest sense, is used to define relationships by consanguinity (*ex aimatos*) or affinity (*ex anchisteias*). Consanguinal relations, however, are considered as closer than those established through the sexual tie of marriage since in consanguinity relatives are thought to share the same substance, that of blood.

Rural and traditional Greek society has often been presented in the anthropological literature as a society overwhelmingly based on kinship. Scholars have singled out the family as Greece's most important social institution and pointed out that kinship pervades all aspects of traditional Greek social life. Kinship constitutes the basis for economic cooperation, political negotiation, and participation in ritual. Its role in the construction of personhood and gender identities is central. Although it can be argued that the urbanization and modernization of Greek society have caused the weakening of kinship ties, kinship still continues to influence social relations on many levels. Nepotism, kinship-based patronage, and formal financial partnerships formed among kin are not uncommon phenomena in the urban context.

The stress on the significance of kinship in the Greek social context is not only confirmed by studies of modern Greece, but also by those of the Classical and Hellenistic periods. The oeuvre of Greek dramatists amply demonstrates the crucial part played by kinship and family in ancient times. There is an observable tendency among Greeks of all periods to define themselves in terms of kinship connections; the ancient Greeks even based political requests and affiliations on real or fictitious kinship ties. Indeed, there is much evidence that shows the immense moral and political importance that the ancient Greeks attached to ancestry. Descent was often traced from a solitary figure, preferably going back to the traditional heroes or deities of Greek mythology. However, it should be pointed out that most of the information available on kinship in antiquity comes from Classical Athens. Generalizations are therefore problematic, and what follows is a synopsis in barest outline.

S.C. Humphreys distinguished four overlapping institutional kinship groupings in ancient Greek society: the official subdivisions of the state (tribe, phratry, deme, and so on), *genos*, kindred, and household. Each of them was characterized by its own structural principles, rules, and patterns of behaviour. Tribes and phratries were the main components or divisions of the citizen body. They functioned as administrative and military units. Membership of them was hereditary and obtained by patrifiliation. Every native-born Athenian male belonged to a phratry, which was a social group over and above the family, responsible mainly for dealing with questions concerning descent, access to citizenship, and inheritance rights. Members of phratries were known as *phrateres*, a word whose meaning is close to that of "brother". Women were usually denied rights of membership to them, but there were cases where women were presented to the phratry of their father or husband. The internal construction of phratries consisted of a variety of subgroups such as the *thiasoi*, responsible for internal political processes of the group, the *genos*, and others. It has been argued that the phratries were themselves subgroups of the Ionian tribes, which were abolished by the new system of Cleisthenes (507 BC). However, this argument rests on a thin base since phratries continued to be functional even after the introduction of the new system, which consisted of tribes and their subdivisions: *trittyes* ("thirdings") and demes. In Athens, each tribe comprised three *trittyes*, one each from the city, shore, and inland regions of Attica, which were divided into ten *trittyes* each. In turn, each *trittys* contained between one and ten demes (in Athens there existed 139 settlements, villages, or town-quarters) and a fixed number of phratries. Hence, Cleisthenes created a ten-tribe structure, each tribe taking the name of a local hero and having a hereditary membership recruited along the male line. Thus, tribes, *trittyes*, demes, and phratries were all patrilineal clans and subclans, which, however, were not genealogically structured as was the case of the Greek patrilineal *genos*.

The *genos* was a kinship institution concerned mainly with aristocratic dominance of the succession to priesthoods. Its earliest use was to denote noble lineage, but in 4th-century BC Athens the term was employed to designate those individual or family groups that had a common plural name, usually derived from that of a genuine or fictive male progenitor. The stress, therefore, was on descent and the *genos* had the structure of a "conical clan". There is evidence suggesting that *gene* were phratry subgroups with a form and function different from phratries and thus not identical to them. Although *gene* were primarily concerned with retaining rights to hereditary priestly office, not all of them were concerned with religious privileges. The larger *gene* showed a variety of other interests relating to common property and admission.

Greek kindred in antiquity was bilateral, extending to second cousins and giving rights to inheritance by the laws governing intestacy. Moreover, marriages between close male kin and *epikleroi* (fatherless heiresses) were encouraged by the Athenian epiclerate. However, marriage in the kindred was restricted, but such impediments varied over time and space.

An Athenian woman could not normally be married to a direct ancestor or descendant, nor to a sibling by the same mother (a practice known in Sparta). Yet, marriage between siblings of the same father or to an uncle or a cousin was allowed. As far as kinship solidarity is concerned, it can be shown that the power of kinship to function as a structural principle of action beyond the bounds of nuclear family was limited in the urban context of the Greek city. Kinship ties did not play an important part in the relationships of Athenian citizens, and political and economic cooperation with kinsfolk was no different from that between friends. In fact, kinship ties were often considered burdensome and dangerous rather than supportive.

The smaller kinship group in ancient Greece was that of the *oikos* (household). The concept of the *oikos* incorporated not only its physical reality, but also designated a group of people who co-resided and were mostly – but not entirely – connected by kin ties (including affines). Finally, it even applied to property, land, and animals as well. Although, from Homeric times onwards, the nuclear family appears to have been the most common residential and economic unit, stem and extended families continued to exist. The circle of kin contained in such units included unmarried female relatives. Labour requirements were often met by the co-residing non-kin household members such as slaves. The emerging picture of the organization of kinship in the household setting is one that exhibits a patrilateral bias since postmarital residence was patrilocal: the bride moved into the groom's house after marriage. Though both matrilocality and patrilocality were a historical reality in Greek society and may have coexisted in the Bronze Age, after Homer the system tended to patrilocal marital residence and partible inheritance of property. In the household unit the man was the *kyrios* (head of household) and acted as such in the public domain. In the Homeric era a man's prestige was completely bound up with his *oikos*. In Classical Athens, however, men became more concerned with public institutions. For this reason, the acquisition of prestige became less *oikos*-centred and more directed towards public contexts.

In Byzantine society the term *syngeneia* was used to denote the family, which by the 8th century was primarily a nuclear one, as well as kinship relations beyond the family unit. From the end of the 11th century we have evidence for the emergence of lineages and for manipulation of ties of kinship in politics. However, unlike the Roman *gens*, Byzantine lineages were not strictly patrilineal and there is no evidence for an organizational structure to lineage and common landownership. The closeness of kinship relations was established by the degree (*vathmos*) of relationship, which was calculated down both collateral lines, beginning with the first births from the original parents and thus arriving at the second degree for two siblings. This reckoning of the degrees of kinship was important for determining marriage prohibitions and rights to inheritance. From the 11th century onwards a restriction of seven degrees appears to have been the prevailing rule adopted by Byzantine law and the Church, which forbade marriage among all blood, adoptive, and spiritual relatives to that degree of relationship and a limit of six degrees for those related by marriage. The rights of kin to inheritance were also determined by the degree of relationship to the deceased. In the case of *ab intestato* succession, from the 6th century onwards the general rule prevailed that all male and female relatives of the same degree of kinship had equal inheritance rights.

The marriage impediments established in Byzantine times are part of Greek Orthodox canon law and are still in force in modern Greece today, though native versions of calculating degrees of kinship are found in many communities. Modern Greece, by most reckonings, is characterized by a bilateral kinship system with a patrilineal skewing or bias that is revealed in various contexts and occasions. In Greece the bilateral form of the kindred is also reflected in terminology. The word for "kindred" is *soi* and refers to one's relatives both through the father and through the mother. Also, we can note the absence of separate terms of address for paternal and maternal relations outside the family.

Yet, it can be argued that modern Greece involves two distinct cultural traditions differing in kinship structure. Such differences are related to distinct modes of organizing post-marital residence, production, transmission of property, names, and reputation. The first cultural tradition is primarily associated with the pastoral and agricultural communities of mainland Greece. Their mode of production dictates an agnatic emphasis in kinship, a bias towards patri-virilocality, and promotes the submissiveness of women. Thus, in such societies brides would join their husbands' households upon marriage, while married sons would either co-reside with their parents or live close to their natal households. Property, names, and reputations are all transferred from father to sons. Yet, it should be pointed out that from the 19th century patrilineal corporate groups were a phenomenon in decline. In Mani the war towers reveal the existence of patrilineal-agnatic clans consisting of all patrilineal descendants of an apical ancestor. Each clan was further subdivided into *genies* (lineages), which branched off to smaller lineages, and these in turn to extended or nuclear families. The Maniot naming system is central to the processes of segmentation, fissioning, and clan formation. Each extended family household of a patriclan takes its surname from the first name of an apical ancestor, while the firstborn sons of male siblings take the first name of their grandfather. Other communities that have a bilateral kinship system with patrilineal overtones are the Sarakatsan shepherds, the Vlachs, and the shepherding communities of Crete. Finally, the agricultural communities of Euboea, Boeotia, and the Ionian islands also practise virilocality. Yet, their kinship system is characterized by a less strongly marked patrilineal bent compared to the societies mentioned above.

The second cultural tradition, which differs in the organization of kinship from the main body of Greece, is that of the Aegean islands. Its main characteristics are matrifocal kinship ties, the uxorilocal residence pattern, where the couple settles in the vicinity of the bride's kin, the rule of house inheritance by women, and the transmission of property and names through both lines, from mother to daughters and from father to sons. Thus, in such communities the kinship structure is characterized by a matrilateral bias, which promotes a comparatively privileged female position and the formation of nuclei of matrilaterally related women (mother and sisters) playing an important role within both the family and the community. This phenomenon should also be linked with the absence of men for long periods of time due to their sea-related occupations. In between these two types of communities there

are others that practise neolocality, where each nuclear family resides in its own dwelling and has a fully bilateral kinship system.

In the Greek understanding of kinship there is a clear distinction between blood ties and affinal ones. In the physical world blood relations are considered stronger since they create a natural union among living kin. In the spiritual world, however, blood is substituted by another life-giving substance, that of oil to create a spiritual relationship (*pneumatiki syngeneia*), which is likened to kinship. This relationship is known in Greek as *koumparia* and is established by the sacraments of baptism or marriage. In many areas of Greece it is customary to renew the relationship, which is inherited through the male line. The godfather of the groom, and not of the bride, becomes their wedding sponsor. This may be regarded as a consequence of the patrilineal bias in kinship. Apart from its spiritual function, godparenthood has also acted in the Greek context as a powerful vehicle for strategic alliances, political recruitment, and patronage. Today, however, in the urban context we notice the tendency of selecting godparents from within the circle of close kin or even from within the family itself.

Another form of ritual kinship that existed in the Greek context, but did not endure to the present time, is that of blood brotherhood (*adelphopoiia*). Blood brotherhood appeared in Greek society after the conquests of Alexander the Great. While in the beginning the tie between two people was established through the symbolic exchange of blood, later on, with the spread of Christianity, this symbolic act was replaced by the prayers of a ritual. There were repeated prohibitions against *adelphopoiia* by the Orthodox Church. Nevertheless, the practice remained widespread in many areas of rural Greece up to the civil war. Its social function was to cement friendship, especially in communities where vendettas were common, and carried with it an obligation of mutual help and support. A marriage impediment existed for those belonging to families that were related by blood brotherhood.

Adoption is also regarded as a form of fictive kinship and in Byzantine times became a spiritual relationship, like that of godparenthood, with which it shared similar marriage prohibitions. Adoption was practised when a childless couple or a couple that had no male children desired descendants and heirs. In antiquity we find the institution of the transfer by adoption of one son from a household with several male heirs to the family of a close kin with none. This practice has continued in Greece up until recent times, particularly in communities with agnatic descent, as a means of continuing the family line and perpetuating the family name.

Finally, secular kinship serves as a model for structuring other types of social relations, such as those between superiors and monks or nuns, and between confessor and confessant. In Byzantium kinship terminology was also used to describe the relation of the emperor to his subjects and to foreign Christian rulers.

Klontzas, Georgios *c.*1535–1608

Painter

Georgios Klontzas was a painter, scholar, and manuscript illuminator of the post-Byzantine period. He was an outstanding figure of the late Cretan renaissance, with an important oeuvre of icons and miniatures. His life and certain aspects of his professional career are to some extent attested by documents discovered in the archives of Venice. A prosperous man, he inherited from his parents houses and the Greek Orthodox church of St Mark in the city of Candia (Herakleion). In 1562 he married Ergina, daughter of the priest Emmanuel Pantaleos, by whom he had three sons, Nicolò, Loukas, and Maneas, who also became painters. He had a fourth son from his second marriage, to Lia Vitzimanopoula.

Klontzas was an independent painter already in 1564, and in 1566 was appointed assessor of an icon by Domenikos Theotokopoulos. In 1586 he executed two paintings (now destroyed), one depicting the healing of the paralytic and another for the Catholic church of the welfare institution of St Anthony in Candia. In 1587 he was commissioned to paint a number of icons by Ioasaph Avouris, bishop of Karpathos. The same year he bought the workshop that he had hitherto rented, which was in the square of St Mark, in the centre of Candia.

Klontzas was certainly associated with cultured circles of the Cretan society of his day. His patrons included Orthodox and Catholic institutions, Venetian noblemen, and Greek bourgeois.

Known works signed by Klontzas (portable icons and triptychs, and two illuminated manuscripts, in Venice and in a private collection in Paris) number barely a dozen. To him or to his close circle are attributed a further 25 icons, an illuminated manuscript of 1577 (Bodleian Library, Oxford), and the surviving folios of two others (Vatican Library, before 1600, and Moscow, State Historical Museum). The book of prophecies that he is said to have given to his son Loukas in 1597 has not been identified or preserved. A few icons bear the forged signature of Georgios Klontzas. This output seems rather limited in terms of quantity, since the painter's career spanned about half a century. Many of his works, however, render multifigural, laborious compositions, and his illuminated manuscripts contain hundreds of complex representations that required many months' work.

Though he was undoubtedly a competent painter of monumental works, he nevertheless preferred miniature scenes on small or large surfaces, on which he unfolded complicated compositions, frequently of an epic spirit. His most important works include his illustration of the hymn "In Thee Rejoiceth" along with other subjects, icons of the Last Judgement, triptychs whose main subject is again the Last Judgement, the a painting of the Seventh Ecumenical Council, a triptych with Christ enthroned and scenes from the *Dodekaorton* (Twelve Great Feasts), an icon with the Transfiguration and scenes of monastic life, an icon with the rare depiction of a sermon in a church, and a painting on panel of the battle of Lepanto. None of these works is dated (the dates on two icons by Klontzas at Sinai are disputed). Stylistic differences between them are related partly to the interval separating the dates at which they were executed, and partly to the fact that other painters worked with Klontzas. No independent works by these other painters have been identified, however. All that has survived is a detailed manuscript map of the city of Candia bearing the signature of his son Maneas.

Klontzas's work as a manuscript illuminator (the idea that he was also a manuscript copyist has been disputed) is of great importance, for both its content and its quality. Two of the manuscripts that he illuminated, containing expanded versions of the prophecies of the Byzantine emperor Leo VI the Wise (Bodleian Library, Oxford, and private collection, Paris) were commissioned from the painter by Francesco Barozzi, an eccentric Venetian nobleman, scholar, mathematician, and occultist, then a resident of Rethymnon, and were intended for Giacomo Foscarini, the Venetian overseer of Crete and collector, who left Crete in 1577. A third, more complex manuscript, of the years 1590–92 (Marciana Library, Venice), includes earlier prophetic and apocalyptic visions, as well as chronicles and historical texts of his time, which Klontzas enlivened with over 400 miniatures. This work by Klontzas continued the great tradition of Byzantine illuminated manuscripts in the spirit of his time, blending elements drawn from the Byzantine legacy with others taken from western European art, the latter derived from foreign engravings and printed books. Another, similar case, though he did not enjoy the same prestige and influence, is that of Klontzas' fellow-Cretan painter Markos Bathas.

Both his miniatures and his independent portable icons betray Klontzas's outstanding ability in the art of miniature painting, of which he was the supreme representative in the post-Byzantine period. With unrivalled skill and facility of drawing he executed ever-moving miniature figures with expressive faces, in a variety of postures. His representations are informed by forceful composition and narrative ability, though *horror vacui* often causes the painted surface to be overburdened.

Though he did not cast off the cloak of the Byzantine tradition, on which his style is based, he made significant strides in the direction of assimilating elements of Western taste, particularly in the matter of perspective rendering of space, architectural features, furniture, and other objects, and he seems to have been particularly attracted by Mannerism. With a freedom unusual in a painter of the Byzantine tradition, he dispensed with the use of the traditional *anthivola* (pricked cartoons used to transfer a motif or even a whole composition

to a new icon) and always created new variations, even when repeating the same subject (his depictions of the Last Judgement are characteristic examples). A restless nature with a vivid imagination, he created some original compositions assimilating influences mainly from the art of the Renaissance and Mannerism. The models from which he adapts features include works by Michelangelo, Titian, and other artists, probably known to Klontzas through engravings. As a personality, however, he is closer to Tintoretto. In his paintings, which are also distinguished by their feast of colour and the original use of tones, the traditional gold ground is occasionally replaced by a blue heaven.

Many of the works executed by Klontzas or his workshop were commissioned or purchased by private citizens, noblemen, and bourgeois for purposes of private piety, and some of them even bear coats of arms. The commissions for manuscripts from the nobleman Francesco Barozzi are indicative of Klontzas's fame, and also of his interests, which transcended his accomplishment as an artist. The painter was probably connected in some way with the well-known poet Antonios Achelis, author of the *Siege of Malta* (1571), since there is some correspondence between the visual motifs in Klontzas's works and Achelis's writings.

His works contain some echo of the historical events and social conditions of his time. The striking frequency of representations of the Last Judgement (over 12 examples) reflects the popular fear that the end of the world was nigh at a period when the Turkish threat was steadily advancing in the Mediterranean. With its eschatological meaning, urging people to just deeds, the Last Judgement is given a very evocative treatment in Klontzas's works, and enriched with details drawn from Italian engravings. His painting of a sermon in a church (in Sarajevo) is strongly didactic in character and hints at social criticism with its inscriptions from the speech of Basil the Great urging the rich to acts of charity on pain of eternal damnation. A historical event, the victory of the Christian forces at the battle of Lepanto (1571), was twice depicted by Klontzas, for unknown patrons. With a striking panoramic treatment based on Italian engravings, these paintings, only one of which survives, are further evidence of the extension of Klontzas's work in the direction of the western style of historical panel painting.

Klontzas's departure from the medieval view of the painter is suggested by his adoption of Renaissance styles in signing his works (his signature, sometimes in the form of verse rather than the Byzantine "Hand of ... "), and in this he may be compared with Domenikos Theotokopoulos and Michael Damaskinos. Through his complex, multifaceted work Georgios Klontzas emerged as one of the most important figures in post-Byzantine art. The influence of his work with its distinct character may be noted mainly in the reproduction of his compositions and the imitation of his miniature style (by Frangiskos Kavertzas and Theodoros Poulakis, among others), though none of the later painters possessed his ability or his intellectual interests.

Biography

Born *c.*1535 in Herakleion, the son of Andreas, Klontzas was a prosperous man who associated with the cultured circles of Cretan society. He was a distinguished representative of the late Cretan renaissance and worked for both Catholic and Orthodox patrons. His works include icons, triptychs, and illuminated manuscripts. He drew on elements of Italian Renaissance and Mannerist art as well as the Byzantine tradition. He died in 1608.

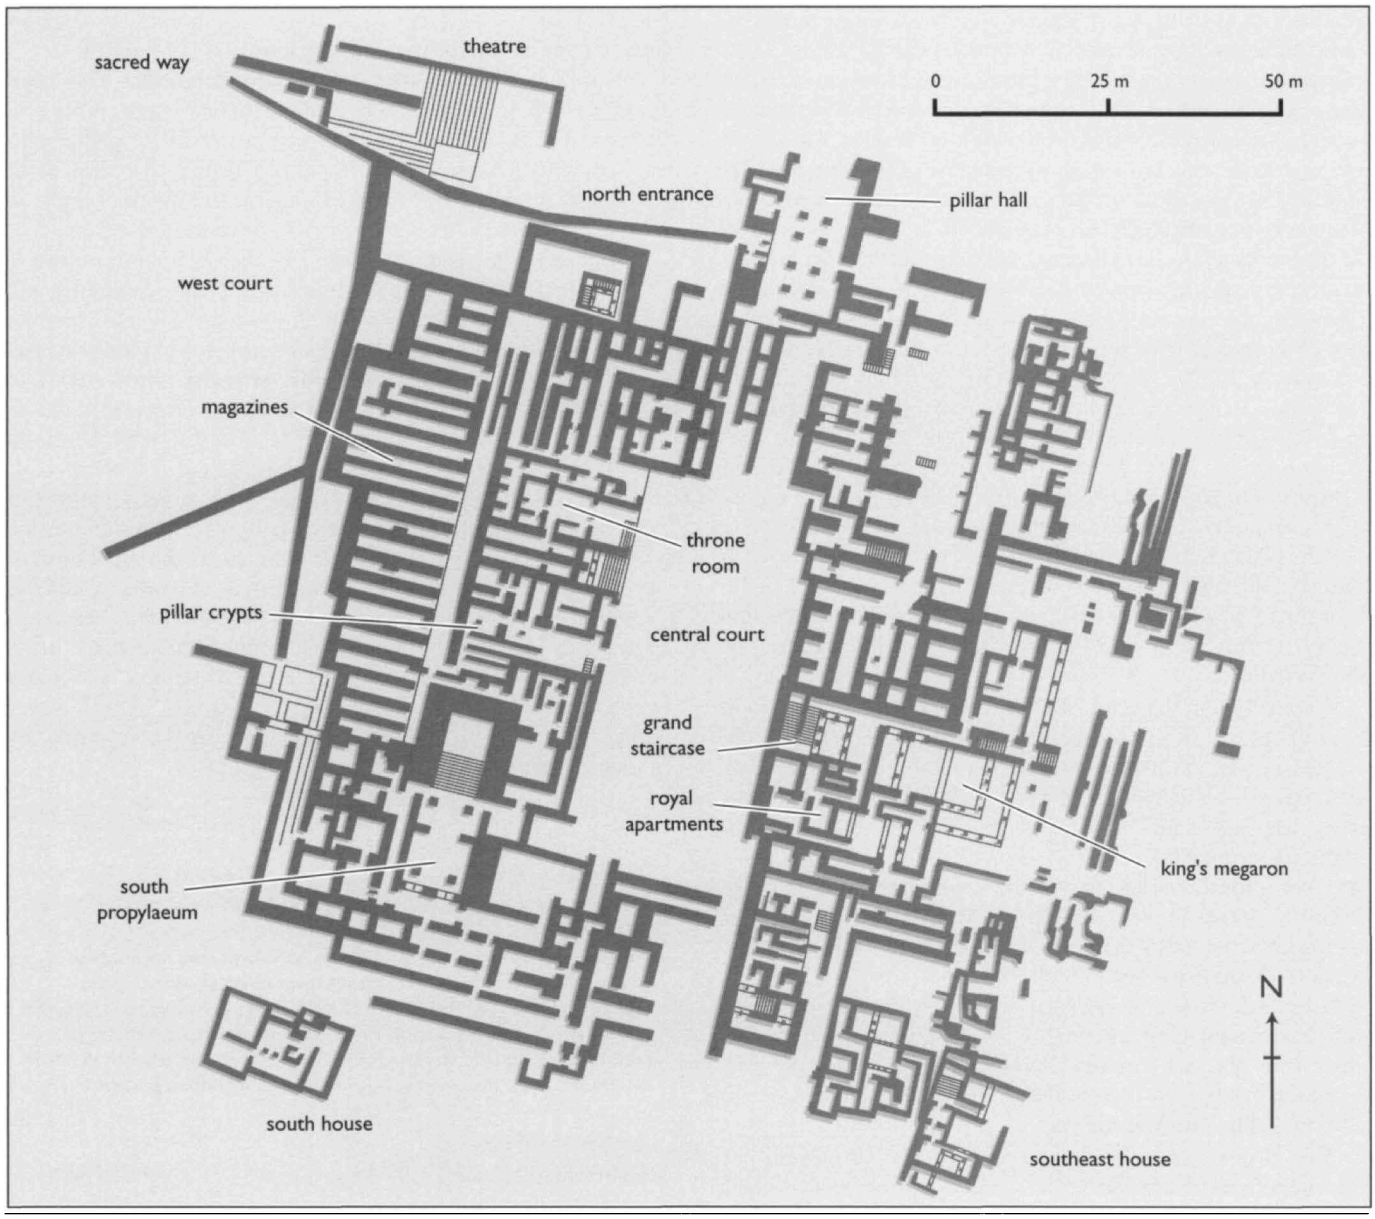
Knossos

Urban settlement and palatial centre in Crete

Knossos lies in the centre north of Crete, two hours' walk from the sea: set amongst low hills, on fertile marly soil and well enough watered. This was a combination that attracted the Neolithic settlers, around 7000 BC, and led to their creating over the next three millennia a substantial tell and the largest of their settlements on the island. Knossos occupied a position of importance, even pre-eminence, seldom surrendered throughout its subsequent history.



22. The palace of Knossos

Archaeological exploration has revealed that its finest period was as a palatial centre of the Minoans in the Bronze Age (3500–1000 BC), known even then as Knossos. Its rise was gradual, though by 2000 BC (EM III/MM I) the settlement was nearly as extensive as it ever was and already centred on a monumental structure, now replaced by the First Palace. About this extended the town, apparently unfortified, and with cemeteries developed especially to the east and north: it was a "capital" of one of several regional groupings, perhaps jockeying for wider power. Knossos seemingly achieved this *c.*1700 BC (MM III), when the Second Palace was erected: its prosperity and vigour were shared islandwide; Minoan dominance was evident in the Cyclades and culturally influential in southern Greece. This frenetic burst of activity may have overtaxed the resource base on which it depended: events and reasons are still disputed, but *c.*1450 BC (LM Ib) much of the island was destroyed in fire and smoke. When this had cleared, power at Knossos was exercised much as before, but now by an elite with a distinctly Mycenaean flavour: changes were expressed in ceramics, dress, weapons; iconographical themes, stylistic renditions; burial types, customs, and locations; and most significantly by the adaptation of the Minoan administrative system and syllabic script, now utilized to express Greek (Linear B). Their control was maintained at least to 1375 BC (LM IIIA1), when a fire ravaged town and palace. Some scholars see this as the end of the Mycenaeans' control; others prolong their existence well into the 1200s BC (LM IIIB). Either way, the town did survive, at a much-reduced scale, with a simpler, if comfortable, standard of living (LM IIIB) before fading into the very troubled times of the 12th century BC (LM IIIC).

Continuity was somehow maintained in this transitional period: Dorian cultural traits became dominant in this region of Crete. The important early Iron Age cemeteries (11th–7th

centuries BC) north of the Bronze Age town indicate this by their use of a Late Bronze Age burial ground, by its rapid expansion, and by the complex burial customs and quite lavish grave goods, with overseas connections visible. Sanctuaries were built over part of the Bronze Age settlement. This flourishing community, with its horse-owning aristocracy, can be traced down to the late 7th century BC, when the evidence dwindles dramatically. The implication is that the polis of Knossos was in decline. Reasons have been sought in military defeat (by Lyttos), plague, and famine. For the Classical period (5th–1st centuries BC) much of the piecemeal evidence comes from literary and epigraphic sources: stasis in the 470s, federal relations with neighbours, migration of ambitious citizens (athletes, architects, and lawgivers) to more progressive milieux. Crete remained peripheral to the Persian and Peloponnesian Wars. By the time of the rise of Macedon, Knossos was populous, to judge from the size of the famine relief donated by Cyrene from 330 to 326 BC. Like much of the Greek world, Knossos was dragged by political manoeuvring into the wider hostilities of the time: internal feuds with Lyttos brought in Phocians and Spartans, and Alexander's campaigns against Darius saw many Cretans dragooned into fighting on the Persian side.

Once released, the genie of military aggression proved to be beyond control. Knossos pursued political domination in the Hellenistic period (4th–3rd centuries BC), more by a network of alliances than outright conquest, though there were exceptions. Knossos' eminence in this struggle is indicated by the island-wide spread of its league, by which it hoped to neutralize more local coalitions. Success was achieved initially: Lykastos, for example, was reportedly razed to the ground; Lyttos fared badly in the war of 221–219 BC; Apollonia and Rhaukos became victims in the early 2nd century BC. But there were setbacks too: a defeat (184 BC) by Gortyn foreshadowed a series of damaging campaigns between these two eminent cities into the 1st century BC; Lyttos grew strong again. Knossian troops were also active abroad as mercenaries, generally staunchly anti-Macedonian.

The Roman incursion (1st century BC) produced one Knossian hero: Lasthenes, who won a sea battle, for which success his house and property were destroyed at the final Roman conquest (69 BC). Gortyn, however, became the premier city, initially in the combined Roman province of Crete and Cyrenaica. After the confusion of the civil wars with Antony, Octavian created the Colonia Julia Nobilis Cnossos in 27 BC. Latin names (settlers from Capua?) feature now in the magistrates and priesthoods. Knossos became a typical Roman provincial city: rebuilt after a series of earthquakes in the early to mid-1st century AD, the colony enjoyed a long spell of prosperity, as well-appointed houses, some rich tombs, and public works (aqueduct) attest. A further major quake in the mid-4th century AD cut this short.

A Christian community was well enough established by the late Roman/early Byzantine times to warrant a bishop's diocese at Knossos (one of 12 in Crete). Remains of three basilicas of 5th- or 6th-century date are reported. Despite all this, the city decayed until finally supplanted by Chandax/Candia after the Arab conquest of the early 9th century. Thereafter a small village of a few hundred souls called Makriteichos marked the locality until the old name was officially restored in the 20th century, partly as a result of the archaeological discoveries made there by the British in particular.

Not that Knossos was ever exactly forgotten. The town makes regular, if relatively uninformative, appearances in Classical to Roman sources (often in historical or philosophical contexts): Nero was fooled into believing that a cache of tablets (Linear B?) told part of the story of Aeneas' flight to Italy. The Roman ruins were visible for centuries.

Rather the focus of attention has always been more firmly fixed on its Bronze Age past, translated into myth and legend. This process was under way by the 8th century BC, when the island and its peoples played a peripheral part in Homeric epic.

Inevitably, Minos and his court attracted most attention. The positive aspects of his character (as a respected judge in this and the next world; the special relationship with Zeus; and as brother to Rhadamanthys the lawgiver) sit a little at odds with his crueller, imperial side (feuds with Athens, control of the seas, conqueror and dynastic manipulator throughout the Cyclades). His nemesis came upon him in the shameful form of the Minotaur, his downfall at the hands of Theseus, and his death in Sicily from betrayal and an over-hot bath. Daedelus, Icarus, the Labyrinth, Glaucus, Ariadne and Talos are other characters that figure in the same circle of stories. All remain potent icons and symbols, tapped into by today's Greek artists and intelligentsia, and regarded with justifiable pride by modern Cretans.

See also Minoans

Summary

Knossos was a major city in Crete for four millennia. Founded *c.*7000 BC, it became the most important palatial centre of the Minoans in the 3rd–2nd millennia and remained strong in the Greek period, before being taken into the Roman world, eventually as a colonia, by Octavian. It faded into obscurity in the 5th–6th centuries AD and is now a tourist centre, based on the Minoan palace.

Kodjabashis

Kodjabashi is a Turkish word meaning "office-holder", from the words *koca* ("big") and *baš* ("head"). In Greek it signified the notable of the village community, while in Turkish this

capacity is rendered with the term *ara*. The elevation to community power, term of office, powers, etc. of the *kodjabashis* depended on the system of organization of each individual community. In some regions they were elected to serve for a specific period of time by the adult male inhabitants; elsewhere, they attained their office through the local guilds. Very often, however, their advancement depended on the Turks. Among their various competencies was the allocation of the taxes among the village inhabitants, since under the Ottoman tax system the fiscal units comprised communities and guilds, and not individuals. The allocation of compulsory statute labour imposed by the Turkish authorities was also within their jurisdiction. Moreover, they had military and judicial powers in matters of private law, as well as in minor criminal offences. The transgressions in the exercise of their duties and their despotic behaviour rendered the *kodjabashis*, as a body, detestable to the people and their title synonymous with tyranny. Adamantios Korais compared them to quadrupeds (Sathas, 1962, p. 634), Karl Mendelssohn-Bartholdy called them "Christian Turks" (1873, vol. 1, p. 7), while Chrysanthopoulos-Photakos (1974) has pointed out that they constituted a body which was united on the basis of their common interests, that their high standard of living was similar to that of the Turks, from whom they differed in name only; "instead of calling him Hassan, they called him Yianni and instead of going to a mosque, he went to church. This was the only point in which they differed" (vol. 1, pp. 42–43). The overall system of the community administration of the Greeks under the Ottoman empire changed during the Tanzimat period (1839–76) on the strength of the General (or National) Regulations (1860–62).

DESPINA TSOURKA-PAPASTATHI

Summary

The *kodjabashi* was the headman of a village community under the Ottoman empire. The name *kodjabashi* became synonymous with despotic behaviour and avarice.

Kolettis, John 1774–1847

Prime Minister of Greece

John Kolettis was Prime Minister of Greece from 1843 to 1847, and one of the 19th century's leading proponents of the irredentist "Great Idea".

In his early political career Kolettis favoured constitutional government and was the leader of the so-called "French" party, which saw France as Greece's natural European ally. This alliance had much to recommend it to irredentist aspirations, as France was less concerned than Britain or Russia with protecting the territorial integrity of the Ottoman empire. The "British" party, under the direction of Alexander Mavrokordatos, looked to Britain's naval superiority in the Mediterranean. The "Russian" party, headed by Count Ioannis and Agostino Kapodistria and Theodore Kolokotronis, emphasized the natural alliance of the Greek and Russian Orthodox Church and opposed the idea of a constitution. These three parties were at odds throughout Kolettis's life.

Kolettis began his career as a physician at the court of Ali Pasha, where he was initiated into the *Philiki Hetaireia*, the secret society in aid of Greek independence. He served as plenipotentiary for Epirus in the First National Assembly of 1821, staying on as minister of war to the provisional national government. His influence with the national government and the Roumeliot chiefs grew as the war proceeded; he was a major force in determining the disposition of funds out of loans from European philhellenes, which meant that large sums went to the Roumeliots and to the shipowners of Hydra and Spetsai, who were the backbone of the Greek navy. It was his strategies that successfully undermined the power and financial base of the swashbuckling but unreliable klepht Odysseus Androutses in eastern Greece.

In October 1824 Kolettis was elected one of five members of the government's executive committee. His knowledge of military strategy was limited – on more than one occasion he was given command of an expedition against the Turks, generally with disastrous results – but his grasp of human psychology and ability to see the big picture made him indispensable.

In 1823–24 two civil wars pitted the leadership of George Kountouriotis against that of Theodore Kolokotronis. Kountouriotis, the elected President of the national government, represented the maritime classes and the Roumeliots. Kolokotronis, the most prominent of the klephtic leaders and commander of the land forces in the Peloponnese, represented the Peloponnesian primates and chieftains, who opposed the idea of centralized government and European-style philhellenism. Kolettis arranged for payment of 50,000 piastres to Kolokotronis and his followers out of the British loan in return for their vacating the capital at Nauplia. When this proved to be only a temporary solution, he organized the Roumeliot troops under Panoutsos Notaras and General Yannis Makriyannis, and drove Kolokotronis's occupying force out. Kolokotronis himself was captured and imprisoned until 1825, when Ibrahim Pasha's attack on the Peloponnese necessitated his release once again to take command of the land forces for the rest of the war. When independence was achieved, both Kolettis and Kolokotronis were awarded positions in president Kapodistria's government.

Upon Kapodistria's assassination in 1831, Kolettis was elected by the Senate to serve with Kolokotronis and Kapodistria's brother, Agostino, on a three-man provisional triumvirate. Civil war again resulted, as Kolokotronis and Agostino Kapodistria tried to establish a new government at Nauplia with the latter as its sole head. In retaliation Kolettis established his own triumvirate, consisting of himself,

Kountouriotis, and the primate Alexander Zaimis, with Alexander Mavrokordatos acting as secretary of state, at Perachora. They were supported in this move by eminent, powerful men such as Petrobey Mavromichalis and Andreas Miaoulis. In April 1832 Kolettis and his Roumeliot troops entered Nauplia once more and forced Kapodistria to resign. Although Kolettis and other Francophiles had initially favoured the son of the duc d'Orléans, the National Assembly met at Pronia in July and approved prince Otto of Bavaria as the new king of Greece.

As a member of the cabinet of prince Otto – now king Otho – Kolettis thrived, despite his position as sole representative of the French party. He was soon appointed minister of the interior, where during the insurrections of 1834 he applied Ali Pasha's technique of using bands of irregulars as peacekeepers. This was an unpopular decision with many non-Greeks at court, who felt such practices might lead to anarchy and "brigandage". He was relieved of office in 1834 and posted as Greek minister to the Paris legation by Otho's most powerful regent, Count Joseph von Armansperg, who leaned towards British allies and the use of European-style police and military.

Even though he would be away for the next nine years, Kolettis' name and policies lived on among his followers. In 1838–40, when it looked as if Mohammed Ali of Egypt might attack the Sublime Porte, and again when the Porte imposed restrictions upon Greek subjects living in Ottoman-occupied lands as retaliation for non-ratification of a Graeco-Turkish commercial treaty, irredentists in Greece and abroad plotted widespread revolt, spreading rumours that Kolettis would return with French funds and military support. The irregular troops he had mobilized, though they were disbanded and ignored by von Armansperg, cherished hopes that they would once again be called into action.

Von Armansperg was dismissed from office and expelled from Greece in 1843, and Kolettis was called back from France. In 1844 he defeated his former ally Alexander Mavrokordatos in an election for the office of prime minister, an outcome that distressed both the British and the Ottoman empires. He continued to work for the Great Idea and strengthened Greece's alliance with the French, though his irredentist zeal overcame his constitutional tendencies: having converted Otho to the Great Idea, Kolettis became an absolutist and supported him utterly. Kolettis's regime, bolstered by his irregular troops and their representatives whom he had brought into office, was widely considered tyrannical. There were accusations of election-fixing and graft; in 1847 he dissolved the Parliament and removed several constitutionalists from public office, then used bribery and "brigands" to elect a government of his liking. Later that year he and his finance minister were accused of falsifying corn averages, which were the basis of taxation. He surrounded himself with a bodyguard of 140 men, maintained at public expense. After his death the government had to confiscate his property to make up for some of the public money he had appropriated for his own purposes. Yet even after his death Otho spoke of Kolettis as his "teacher", and the only minister he had ever fully trusted.

Kolettis died of kidney disease on 6 September 1847. He was succeeded in office by his minister of war, General Tsavellas.

As a politician, Kolettis had an uncanny ability to come out on top in virtually any circumstances. Lord Palmerston complained in a memo to Prince Albert shortly before Kolettis's death that "In the Foreign relations of the Country Mr. Koletti [sic] seems to have had three leading objects in view, aggression towards Turkey, subservience towards France, and insult towards England." The acerbic British historian and philhellene George Finlay, who knew and distrusted Kolettis, describes him as "portly" and "sagacious" in appearance, with a "prudent" and "oracular" demeanour: "Kolettes [sic] wore the wise look well, and had the sense to speak little, but as he was not always silent, his tongue betrayed him." Given Kolettis's success, this last remark might be looked upon as something of an exaggeration.

Biography

Born in 1774 in Syrrakos in northwestern Greece, Kolettis was a Vlach who studied medicine in Pisa. Appointed physician to the court of Ali Pasha, he joined the *Philiki Hetaireia* in 1819. He played a major political and military role in the War of Independence. He became one of the leading proponents of the "Great Idea" and was prime minister of Greece 1843–47. He died in 1847.

Kollyvades Movement

An Orthodox revival and protest movement of the 18th century

The Kollyvades constituted a significant protest movement that originated on Mount Athos in the second half of the 18th century and played a vital role in the religious and intellectual life of Greece. On the one hand, they initiated a renaissance of patristic spirituality and a return to traditional Orthodox ecclesiastical life; on the other hand, they reacted against strong pro-Western secularizing trends under the influence of the Enlightenment.

The term "Kollyvades" derives from *kollyva*, an oblation of grains of boiled wheat bedecked with sugarplums and distributed to church congregations in remembrance of the dead. "Kollyvades" was in fact a term of opprobrium attributed scornfully to the representatives of the movement by their opponents. The controversy began on Athos in 1754. The monks of St Anne's skete decided for practical reasons to perform memorial sevices on Sundays after the end of the Divine Liturgy instead of on Saturdays, as was the Athonite custom and the canonical tradition. The deacon Neophytos Kavsokalyvitis (1713–84) reacted against this innovation, however, considering that it deviated from ancient Orthodox tradition. The development of the controversy, which divided Athos, later included other matters of dispute, especially that of frequent participation in Holy Communion, as outlined in two relevant books (Venice, 1777 and 1783). The second book was initially condemned by patriarch Gabriel IV in 1785, but this condemnation was later annulled by patriarch Neophytos VII. The leading figures of the Kollyvades movement also included Makarios Notaras (1731–1805), formerly archbishop of Corinth, Nikodimos Agioreitis (1749–1809), and Athanasios Parios (1721–1813). Among the anti-Kollyvades party the monks Theodoritos from Ioannina and Vissarion from Rapsani were particularly notable.

The Kollyvades adduced several arguments from patristic and canonical traditions as well as Orthodox ritual practice to support their views. As may be expected, the whole conflict was not conducted with moderation. It included conspiracies, manipulations, slanders, distortions, banishments, acts of violence, and even the murder of monks. The patriarchate of Constantinople was alerted by these dissensions, and in July 1772 Theodosios II sent a compromise letter, in which, according to the principle of ecclesiastical economy, the opinions of both sides were included. Yet no progress was made, and a second conciliatory letter was sent to the warring factions on 10 June 1773 to restore concord and peace on Athos. After these unsuccessful interventions, the anti-Kollyvades managed through various means to persuade the patriarchate of the justice of their cause. Hence, on 9 June 1776 patriarch Sophronios II issued a condemnation of the Kollyvades, demanding, among other things, that Athanasios Parios be unfrocked. The Kollyvades never accepted this, and remained faithful to their ideas and practices, while Parios worked towards his reinstatement, which finally took place in 1781. The whole conflict was rekindled in 1804 when further accusations were brought against the Kollyvades. In a synod of the Athonite monasteries in Karyes on 19 May 1807 these accusations were thrown out as unfounded, while Agioreitis expounded his *Confession of Faith* on 13 June 1807 before the synod, and his reputation was officially restored. The Kollyvades issue was occasionally raised again in the first half of the 19th century, and several patriarchs took decisions (e.g. Gregory V in August 1819) to settle the whole problem.

The Kollyvades' desire to return to the authentic springs of Orthodox tradition can be understood in the context of the decline of spiritual life even within the Athonite monastic community and from the Western spirit that was growing among the Orthodox faithful. Apart from the immediate cause of the eruption of this conflict, the Kollyvades later incorporated several other issues in their agenda in a holistic attempt to revitalize the traditional Orthodox ethos: frequent participation in the sacraments of the Church and especially Holy Communion; strict adherence to traditional ecclesiastical ceremonial; greater acquaintance with the patristic, hesychast, and ascetic literature and spirituality; and an all-out struggle against the alienation of the Greeks from Orthodoxy because of various Western influences. The Kollyvades' acquaintance with patristic literature is evident from Notaras's and Agioreitis's publication of the *Philokalia*, a florilegium of 1,207 folio pages (Venice, 1782) containing ascetic and mystical texts on the theory and practice of prayer by 38 authors writing between the 4th and the 15th centuries. The Kollyvades also undertook the publication of other patristic writings (e.g. of Symeon the New Theologian), and Agioreitis prepared a complete edition of Gregory Palamas's works (the three-volume manuscript was lost in 1797/78 in Vienna). Moreover, the Kollyvades influenced the Orthodox population in various parts of Greece through their spirituality, preaching, and teaching ministry. They also exerted considerable influence on the Slavic Orthodox world, since the *Philokalia* was translated into Old Church Slavonic by Paisy Velichkovsky and published in Moscow in 1793, and later into Russian, Romanian, and other languages.

Among the Kollyvades, the most bitter opponent of the Enlightenment was Athanasios Parios, who had numerous intense disagreements with his contemporaries (e.g. A. Korais, K. Koumas, D. Proios, Veniamin Lesvios). Parios wrote and published extensively against the Enlightenment and the French Revolution, and his sharp criticism was adopted by the patriarchate of Constantinople for its own defensive policies. Parios also formed an unofficial group of sympathizers (e.g. D. Voulismas) and tried to inhibit the dissemination of Western ideas in Greek schools (e.g. in Chios and in Kydonies). He also made a name for himself by admonishing Orthodox Greeks to keep away from Europe, viz. the West, if they wanted to save their souls.

Though not at all uniform, the Kollyvades occasioned various heated reactions and misunderstandings. A large part of Greek historiography before the 20th century portrayed them in a negative way. They were indiscriminately considered as ignorant, unscrupulous, fanatical, obstinate, manipulative, reactionary, and unaware of Greece's actual needs at the time. But in recent decades the Kollyvades have been reassessed on the basis of a more global view of Greece's religious and intellectual history over the last two centuries. This does not mean that the Kollyvades' exaggerations and erroneous judgements were entirely passed over in silence, but an attempt has been

made to consider the whole movement on its own terms and to assess its impact and contributions. From this perspective, it has become obvious that the Kollyvades were instrumental in reorientating the Greek world towards Orthodox ascetic and spiritual sources.

The Kollyvades movement can also be viewed as an antecedent of modern Greek fundamentalism. It started out from private initiative and remained in tension with the official Church and the surrounding culture. It also claimed to represent a more genuine understanding of Orthodoxy and tried to regenerate the fossilized official Church and religious life. The importance that the Orthodox Church now accords to the Kollyvades is apparent in many ways, such as the continuing influence of the *Philokalia*. Most significant perhaps is the fact that three eminent Kollyvades have been canonized: Makarios Notaras soon after his death in 1805, unofficially by the Orthodox flock; Nikodimos Agioreitis in 1955 and Athanasios Parios in 1995, both of them officially.

VASILIOS MAKRIDES

See also Philokalia

Summary

The Kollyvades movement began in the monasteries of Mount Athos in 1754. Originating as a protest against certain religious practices, the Kollyvades became a force for renewal of the authentic Orthodox tradition. They argued for frequent communion, adherence to traditional ceremonial, and familiarity with ascetic and spiritual texts. In 1782 they published the mystical anthology known as the *Philokalia*.

Kolokotronis, Theodore 1770–1843

Hero of the War of Independence

Theodore Kolokotronis was the commander-in-chief of the forces in the Morea (Peloponnese) during the War of Independence and its aftermath (1821–33). One of Greece's greatest war heroes and a clever strategist, Kolokotronis was considered the most formidable of the *kapetanoi* (leaders) ranged against the Europeanized "Central Government" represented by Alexander Mavrokordatos, George Kountouriotis, and Demetrios Ypsilantis. Unlike some of the other heroes of the revolution, such as General Makriyannis, Kolokotronis supported the regime of Count Ioannis Kapodistria when he became president of the newly liberated Greece in 1828. When Kapodistria was assassinated in 1831, Kolokotronis was elected by the Senate to serve with Kapodistria's brother, Agostino, and John Kolletis on a three-man provisional triumvirate. The combination was not a happy one; Kolettis favoured the "French" or "Constitutionalist" party and Kolokotronis and Kapodistria favoured the "Russian" or "Kapodistrian". The result was a civil war that raged until prince Otto of Bavaria took the throne as king Otho in 1832.

The Kolokotroni were an old and respected klepht family, in the tradition of the fiercely independent freedom fighter. As a Greek "type", the historian C.M. Woodhouse has compared Kolokotronis with the avenging "outcast" as represented by Antaeus, Sciron, or the Titans. His father, Constantine Kolokotronis, who died fighting at Kastanitza in 1780, was

said to have killed at least 700 Turks with his own hands. Kolokotronis himself, at the age of 16, compelled the Sublime Porte to recognize him as chief of the *armatoloi* ("armed men") of Megalopolis. The family became so influential that the Porte ordered extirpation of the entire clan in 1804; 36 of Kolokotronis's brothers, cousins, and relatives, and 150 of their followers, were tortured and killed. Driven from his home, he took refuge on the Ionian islands in 1806.

When the British occupied Zakynthos in 1810, Kolokotronis joined the First Duke of York's Greek Infantry with the rank of captain (later major). He served in the British army under Sir Richard Church for ten years, during which period Kolokotronis was sworn into the *Philiki Hetaireia*, the secret society in aid of Greek independence. With the aid of the hetairists, Kolokotronis slipped back to the Peloponnese shortly before the outbreak of the revolution and, with a growing band of followers, was among the most enthusiastic plunderers of Turkish residents. This activity gave him sufficient funds to maintain the biggest band of armed Greeks in the area, so that by the time Demetrios Ypsilantis arrived in June 1821 to take control on Hydra, Kolokotronis had about 3000 men at his call. He had the biggest contingent at the Tripolitza massacre in October, where several thousand Turkish civilians were slain, and his memoirs grimly describe his triumphal ride over streets carpeted with corpses: "My horse from the walls to the palace never touched the earth." He had another great victory in June 1822 when he annihilated the forces of the Turkish commander Mahmoud Dramali, who was marching from Corinth to attack the new Greek capital at Nauplia.

By the end of 1822 Kolokotronis had allied himself with a few powerful landowners of the Peloponnese, chief of whom was Petrobey Mavromichalis, overlord of the Maniots. The group opposed centralized government and European-style philhellenic nationalism: in December 1822 they prevented the provisional National Assembly from meeting by refusing to allow the members into Nauplia, which Kolokotronis and his son Panos were holding at the time. The central government held the assembly at nearby Astros, and moved that their two major concerns ought to be to send representatives to seek a loan in London and to pass legislation aimed at decreasing Kolokotronis's power. Kolokotronis responded by kidnapping four of the assembly members and removing them under armed guard to Nauplia; the others took refuge on a southern promontory of the Peloponnese where they benefited from the protection of the nearby islands of Hydra and Spetsai. In gratitude for that protection, they elected the Hydriot George Kountouriotis as their new president, but there was no question after this that Kolokotronis was the real power in the Peloponnese.

In 1823 this situation led to the first civil war, which did not come to an end until 1824, when the central government paid Kolokotronis 50,000 piastres out of the first London Greek Committee loan in exchange for his giving up the possession of Nauplia and agreeing to cooperate with them. Shortly afterwards, however, a second civil war broke out over how to spend the remainder of the money. The rebel primates Zaimis and Londos challenged the authority of Kountouriotis's government and Kolokotronis joined them. When Panos was killed in a skirmish outside Tripolitza, Kolokotronis surrendered and allowed himself to be imprisoned on Hydra.

In 1825, when Ibrahim Pasha was threatening the Peloponnese, public demand forced Kolokotronis's release from prison and reappointment as commander-in-chief of the land forces. In this capacity he made an uneasy alliance with the regular troops of the French philhellene Charles Fabvier, whose tactics were more successful with Ibrahim's European-trained troops than the klephtic guerrilla warfare favoured by Kolokotronis and his followers. In 1827 Kolokotronis invited his old commander, Sir Richard Church, to share the command with him. This partnership lasted the duration of the war.

Though Kolokotronis officially withdrew from politics when King Otho ascended the throne in 1832, the Bavarian regency feared his influence. In September 1832 he was arrested and condemned to death on a trumped-up charge of treason. The sentence was commuted to life imprisonment, but when Otho came of age in 1835, Kolokotronis, along with his brother-in-law and other followers who had been imprisoned with him, was issued a full pardon by the king and restored to favour. Kolokotronis retired to Athens, where he remained a war hero and powerful political voice in favour of Greek nationalism until his death on 4 February 1843.

Biography

Born in 1770 into an old klepht family, Kolokotronis fled from Ottoman persecution to Zakynthos which was occupied by the British from 1810. He served in the British army under Sir Richard Church and also joined the *Philiki Hetaireia*. In the War of Independence he became commander-in-chief of the forces in the Peloponnese and supported the regime of Ioannis Kapodistria. Charged with treason but pardoned, he retired to Athens where he died in 1843.

Komnene, Anna 1083–*c.*1153/54

Historian

Anna Komnene was born on 2 December 1083, the eldest daughter of the emperor Alexios I Komnenos (1081–1118) and his wife Irene Doukaina. In her work the *Alexiad* Anna herself gives an indication that her life's ambition had been to become empress. A few days after her birth she and the young Constantine Doukas, son of the dethroned emperor Michael VII, had been betrothed; they were associated in her father's reign, and publicly acclaimed. After the birth of a brother, John, her hopes of becoming empress at the side of her future husband were shattered. It was a devastating blow to the woman whom Charles Diehl describes as "très princesse".

Anna received an excellent education, and was further able to perfect her knowledge of Classical literature and mythology without the approval of her parents, who would have considered this a danger to her Christian upbringing. It has been said that her achievements in both the trivium and the quadrivium were well above average. In addition to the standard curriculum of the times, she acquired mastery of geography and medicine.

After the premature death of Constantine Doukas, she married Nikephoros Bryennios, still hoping to gain the throne at the side of her husband. In a famous deathbed scene in the *Alexiad* she describes how she and her mother desperately tried to persuade the dying emperor to disqualify his son from the throne and designate Bryennios and Anna as his successors. Having failed at this, Anna became involved in an uprising against her brother, and a botched assassination attempt. When this rebellion too had failed, Anna and her mother retired to a convent that the empress had previously founded.

It was during the later years of her life that Anna may have cultivated a circle of scholars. She commissioned Michael of Ephesus to produce a commentary on Aristotle, and seems to have had in mind a more ambitious project, of publishing a whole series of commentaries. After her husband's death (*c.*1136/37), Anna dedicated the rest of her life to the writing of the history of her father's reign, the *Alexiad*.

In the preface to the 15 books of the *Alexiad* Anna writes that she regards her work as a continuation of the historical writings of her husband, Nikephoros Bryennios. Herbert Hunger postulates that, besides Bryennios, the sources of Anna's history included Psellos, Attaleiates, and Skylitzes. In her privileged position she would also have had access to documents and letters in the imperial archives. Her knowledge of the imperial family was based on her intimate personal contacts. Regarding military matters, she would have had many opportunities to question the veterans of her father's campaigns, and she herself had been an eyewitness to the coming of the First Crusade.

Her description of the crusaders, the "Latins" as she generalizes them, is influenced by her distrust of what she, the Byzantine aristocrat, considers to be a barbarian force. She is fascinated by individual participants, such as the Norman prince Bohemond, of whom she gives an admirable picture. In general, however, her prejudices colour her descriptions. Regardless of this, Anna's account of the First Crusade, as seen from the Byzantine perspective, is a very valuable source, and is established as such in modern scholarship.

Her work is also of great importance for the description it gives of various peoples in contact with the empire, especially the Seljuk Turks and other steppe nomads on the empire's northern borders. It contains details as varied as the administration of the empire, military matters, heresies, education, and medicine.

The style of Anna's work is deemed to attest to the conscious efforts made by Byzantine writers of the Komnenian period to return to purer Classical models and Atticism. As such, the *Alexiad* of Anna stands as the first important work of the literary renaissance of the Komnenian period. Her work is replete with citations from Classical authors – Homer, the tragedians, historians, and the *Anthologia Palatina*. Regardless of the Classicizing tendencies, however, Anna uses the common language of her time without scruples when she needs to use technical terms.

The *Alexiad*, Anna's epic account of her father's reign, is the only historical work in Byzantine literature written by a woman; it remains an important creation on both the literary and historical levels.

Komnenos family

The Komnenos family was an aristocratic clan that originated presumably from a place called Komne (its location is uncertain, but was probably in the east). By the mid-11th century the family's properties were centred on the fortress of Kastamon, in northern Paphlagonia, which was in Turkish hands intermittently from 1076 and definitively so by the late 12th century. In the early 11th century the Komnenoi became prominent landowners and generals, giving rise to an imperial dynasty that would dominate the Byzantine empire for a century and a name that would retain its imperial lustre until after the Turkish conquest.

Isaac I Komnenos was put forward as emperor (1057–59) by the military aristocracy, who were dissatisfied with the treatment they received from Michael VI (emperor 1056–57).

Komnenos family: woodcut of the Komnenos and Angelos emperors, from left, top row: John II Komnenos, Manuel I Komnenos, Alexios II Komnenos; second row: Andronikos Komnenos, Isaac II Angelos, Alexios III Angelos

Isaac was himself forced to abdicate when his fiscal and religious policies proved widely unpopular. His brother John and John's sons (especially Isaac and Alexios) remained prominent until 1081, when the young Alexios seized Constantinople from Nikephoros III Botaneiates (emperor 1078–81). Alexios, married to Irene Doukaina, united the two most prominent aristocratic clans, the Komnenos and the Doukas, giving him a formidable position in a society where family connections were of increasing importance. His reign brought steady recovery from the disastrous position in which the empire found itself after defeat by the Turks at the battle of Manzikert. Alexios was succeeded by his son John II Komnenos (emperor 1118–43), his grandson Manuel I Komnenos (emperor 1143–80), and his great-grandson Alexios II (emperor 1180–83). All save the last were strong rulers during whose reigns the Byzantine empire regained a measure of stability and economic prosperity, despite continuing Turkish pressure in Asia Minor, constant challenges in Europe, and the disruptive passage of the First and Second Crusades in 1097 and 1147–48 respectively. Alexios II succeeded as a minor and fell victim to civil war in the Komnenos family. He was murdered at the age of 14 by Andronikos I, his father Manuel I's cousin and greatest rival. Both Alexios and Andronikos would fulfil the prophecy that the initial letters of the Komnenoi emperors' names would spell *AIMA* (blood). Andronikos was himself killed in a bloody spectacle in the hippodrome after only three years of rule, and in 1185 power passed to the Angelos family.

Alexios I and his successors consolidated their hold on power by employing in high posts only members of the extended Komnenos family, which was prolific; the word

gambros (relative by marriage) became a semi-official title. By the mid-12th century virtually every major position, whether in Constantinople or the provinces, was likely to be held by a Komnenos or a close relative. The Komnenos century was once viewed by historians as a period of exploitation of the empire by the imperial family, culminating in the policies of Manuel I, which were condemned as expansionist and ruinously expensive. Trading concessions given to western maritime republics in return for naval aid were regarded as specially dangerous short-term measures. More recently, however, it has been established that the empire was generally prosperous during this period and that concessions offered to westerners were less damaging than had been claimed. Bias in modern scholarship against Manuel has been shown to derive, at least in part, from Niketas Choniates, the dominant historian of Manuel's reign and of the collapse which followed, which led with seeming inevitability to the capture of Constantinople by soldiers of the Fourth Crusade in 1204.

The Komnenos family included several figures important to the development of Byzantine culture. The most prominent was the historian Anna Komnene; her father Alexios I wrote some verse, and an Isaac (probably her brother) essays on Homeric topics. In the 1140s the *sevastokratorissa* (emperor's sister) Irene Komnene (a Komnene by marriage, widow of Manuel I's brother Andronikos) was a significant patron of literature and painting. As well as palaces, members of the family built churches, of which John II's foundation of the monastery and hospital of the Pantokrator in the capital was the most lavish. Several other churches founded by Komnenoi may be found in the southern Balkans. In the history of literature the period of the Komnenoi marks the first appearance in Byzantium of professional littérateurs, of whom Theodore Prodromos is the best-known example. Consequent pressure of the marketplace may be responsible, in part, for two other developments: the first surviving literature in vernacular modern Greek (e.g. the satirical so-called *Ptochoprodromika*, poems by multifaceted Penniless Prodromos, and *Digenis Akritis)*, and the proliferation of court writing dominated by rhetorical praise of the dynasty, which, since the Enlightenment, has given the writing of the time a bad name.

Even after the Komnenos family had lost imperial power, their name continued to exert a resonance, especially in conjunction with others, for example, Angelos or Vatatzes. The Grand Komnenoi, rulers of Trebizond after the Latin conquest of Constantinople in 1204, used the name as a title until finally succumbing to the Turks in 1461.

Kontoglou, Photis *c.*1895–1965

Painter, iconographer, and writer

Kontoglou's enormous contribution to the cultural life of modern Greece defies simple classification. Chiefly remembered today for having revived the ancient "Byzantine" style of ecclesiastical art, he has left his mark on modern Greek secular art, literature, and religious thought. More than three decades after his death his books are still published, and read by all generations. His two-volume opus, *Ekphrasis tes Orthodoxou Eikonographeias* ("Description of Orthodox Iconography", 1960), still serves as the standard text and guide for icon painters all over the world. Moreover, his forthright and at times childlike simplicity and artlessness characterized qualities held by many Greeks to be quintessentially Hellenic.

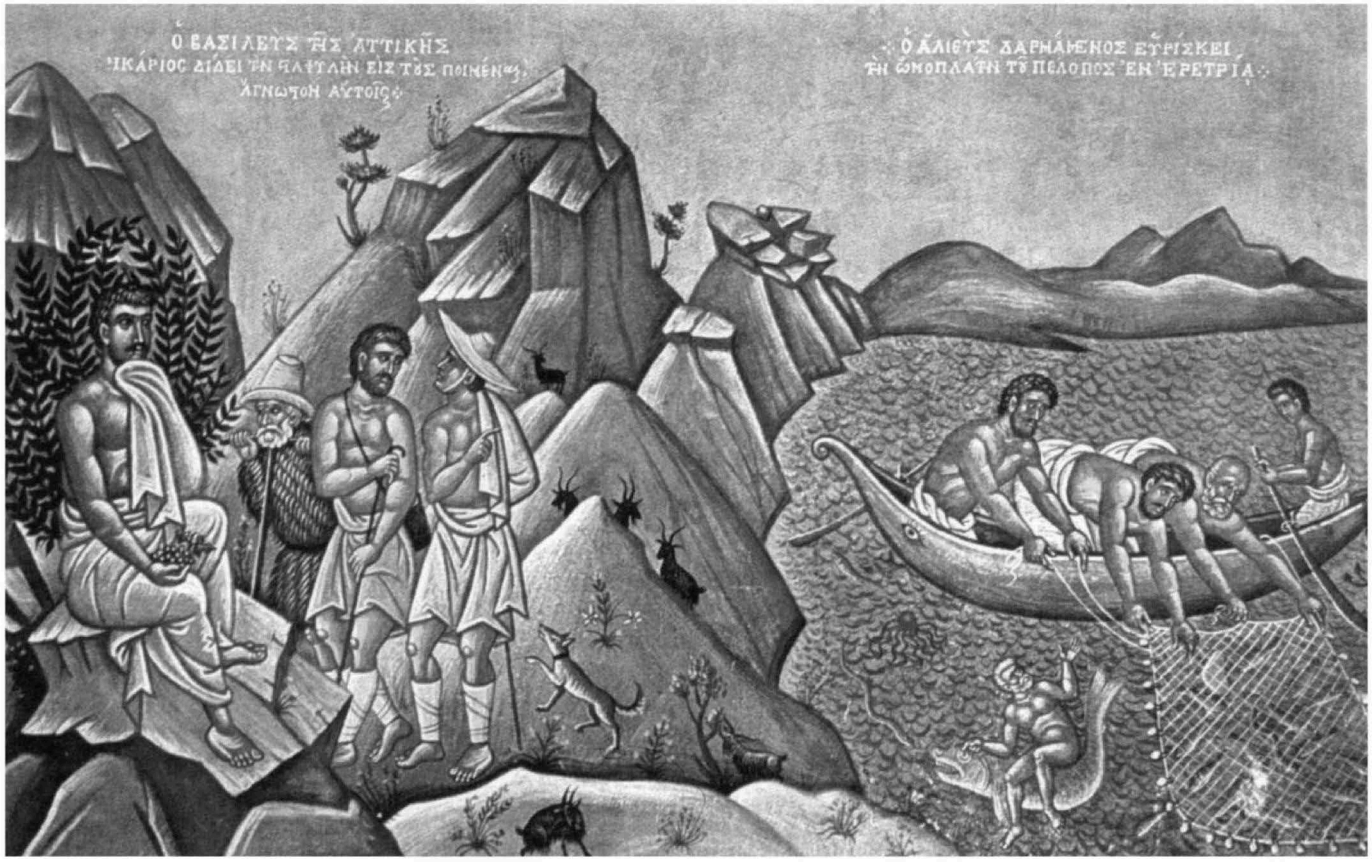
Kontoglou was born at Aivali, near the ancient city of Cydoniae in northwest Asia Minor in 1895 or 1896, and was always proud of having been born "in Asia". His childhood surroundings left happy memories that would stay with him all his life, and appear time and again in his work. Indeed, the almost poignant sense of melancholy and nostalgia in much of his secular art and writings seems to have been the result of a constant longing for those happy years.

A relative of Kontoglou's noticed his artistic potential and sent him to Athens to study at the Polytechnic's School of Fine Arts, a highly traditional institution still dominated by artists of the so-called "Munich School" of the 19th century. The outbreak of World War I isolated Kontoglou from Aivali, and being dissatisfied with the School of Fine Arts, he left for Paris where he spent some years working as an illustrator. Here he claims to have met Rodin and Maeterlinck, but his Parisian sojourn hardly left any traces in the painter's work.

Returning to Aivali in 1919, Kontoglou began teaching at the girls' school at Cydoniae. At the same time, he and a group of friends organized an intellectual group called "New People" at Aivali. He also published his first major book, the novel *Pedro Cazas*, which was hailed in Athens and Mytilene as a breath of fresh air in the then stuffy world of Greek letters.

The 1922 catastrophe turned Kontoglou into a refugee, first in Mytilene then in Athens, where he reported feeling like "a caged bird". His love for travel led him in 1923 to visit Mount Athos, where he got his first real taste of the forms and techniques of Byzantine art. This eye-opening experience led to the publication of *Art of Athos: Reproductions and Variations by Photis Kontoglou* (1923) and *Vasanda*, a collection of writings and illustrations inspired by Athos. The same year also saw Kontoglou's first exhibition in Mytilene.

The 1920s and 1930s were productive years for Kontoglou, both as a painter and as a writer. He coordinated the influential but short-lived journal *Philiki Hetaireia* ("Society of Friends"), beginning in 1925, and collaborated with the periodical *Ellinika Grammata* ("Greek Literature"). Kontoglou spent much time travelling in Greece, but his stint at Mistra in the 1930s working on the conservation of the Byzantine murals in the churches there was a decisive influence on his work. He also worked on the murals of the monastery at Kaisariane, near Athens. His house in the Kypriadou district of Athens became a second home for a number of young painters and thinkers including Ioannis Tsarouchis and Nikos



Photis Kontoglou: detail of the fresco *The Kings of Attica*, showing Icarius, king of Attica, on the left, and the invention of a relic of Pelops on the right, Municipal Reading Room, Athens

Engonopoulos. One wall of this house was painted by the group of friends with exotic and fantastic scenes of tropical islands, indigenous peoples of the world, a portrait of Kontoglou's family, and busts of famous men. The mural (now in the National Art Gallery in Athens) is one of the most widely loved of Kontoglou's works.

In addition to more secular commissions and written works (including the *Astrolabe*, 1935), Kontoglou received his first commission to decorate a complete church, at Rio near Patras. In the same year he did restoration work on the murals of the Peribleptos church in Mistra – a task which he found particularly stimulating and inspirational. Work of this calibre had not been used for Byzantine mural conservation till that time.

In 1937–38 Kontoglou undertook an important secular commission in the form of murals for the entrance hall and reading room of the Athens Town Hall. Themes included ancient Greek mythology and a cavalcade of important Greek historical figures up to 1821. This was the first time that a secular work on such a scale employed the Byzantine style, and caused not a little controversy in a country that had been taught to think of that style as "backward" and regressive, in contrast to the naturalism of the Italian Renaissance style, which in the 19th and early 20th centuries was used for both public and religious monuments. Kontoglou was, along with two or three others, instrumental in opening the Greek public's eyes to the sublime spirituality of Byzantine art. His efforts would eventually result in Western "Italianate" art being discouraged and even banned for new or redecorated churches. The art of portable icon painting also owed its resurgence to Kontoglou and his apprentices, and he invigorated the art of book illustration (chiefly in the woodcut medium) which drew heavily on the Greek folk-art idiom.

The Nazi occupation of Greece during World War II was as hard for Kontoglou and his family as it was for the rest of the nation. He had to sell his beloved home for a little flour and oil, and lived with friends – at one stage in a garage – during the struggle. With his resources limited and commissions few and far between, he put his abundant energy into writing, producing, among other works, *The Mystical Garden* in which he outlined his manifesto for a return to Byzantine art in a 20th-century Orthodox context. For Kontoglou, Byzantine art was not a relic to be revived from the past, but a valid "living" tradition that had to be understood and properly taught.

The postwar period brought one of his most important commissions, the controversial decoration of the Byzantine church of Kapnikarea in central Athens. Despite criticism that no archaeological monument should be interfered with by modern painters, Kontoglou realized one of his most influential and perfect iconographic programmes for a church, which served as a paradigm for his "new" Byzantine style. A host of other church commissions followed, and some designs and cartoons were even dispatched to the United States where they were fitted into new Orthodox churches.

Publishing activity continued apace with widely read contributions to the liberal newspaper *Eleutheria* and the Orthodox periodical *Kivotos*. Here he hailed "the invigoration of

Orthodox convictions, and the heralding of an enlightened return to the essence of tradition". In the newspaper *Orthodoxos Typos* Kontoglou made a name for himself by relentlessly attacking any plans for union with the Roman Catholic Church and defending Orthodoxy from what he saw as the danger of Western materialism. He presided over an informal "school" of painters that included Constantine Georgakopoulos, Petros Odambasis, Ioannis Terzis, Rallis Kopsidis, Petros Vamboulis, and Spyros Papaloukas.

In 1960 *Ekphrasis* appeared in two volumes to universal acclaim, and Kontoglou began to be showered with awards from the state, the Church, and the Athens Academy, including Greece's highest distinction, the Commander of the Phoenix. A complete series of his writings began to appear, published by Astir, and much previously unpublished material has appeared.

Kontoglou died on 13 July 1965 after a protracted illness initiated by wounds from a car crash the previous year. His loss was greatly mourned, and his remains now lie in the grounds of the monastery of Hagia Paraskevi at Nea Makri.

Kontoglou would not have wished to be remembered as a cult figure, but his eccentric bearing, his passion for his Church and traditions, his mistrust of the West and things Western, his contempt for the vanity and socializing of the art world, and his idiosyncratic but charming use of the Greek language made him a revered figure among traditionalist, but also intellectual circles in Greece and in the broader Orthodox community. His unabashed championing of the Byzantine style in secular works greatly influenced younger artists, most notably Tsarouchis. But his signature style ("Through the hand of Photis Kontoglou") underscored the fact that his art was nothing to do with "originality" and "individual expression", but drew on a source as old as the Greek people itself.

Korais, Adamantios 1748–1833

Classicist, political theorist, and man of letters

Adamantios Korais was perhaps the foremost representative of the Greek Enlightenment. Born in the cosmopolitan mercantile centre of Smyrna in 1748, he completed his primary education there. Between 1771 and 1777 he was immersed in his family's commercial activities of silk export in Amsterdam. After his return to Smyrna (1778–82) Korais moved back to Western Europe and studied medicine at Montpellier, receiving his doctorate in 1787. In 1788 he moved to Paris where he stayed until his death in 1833. Korais distinguished himself as a critical editor of ancient Greek literature and was highly esteemed by scholarly and political circles, both in France and abroad (e.g. by Thomas Jefferson). Having close contacts with the intellectual and political elite of his day, Korais followed, like a meticulous reporter, all major events in French and international politics (e.g. the French Revolution, Napoleonic wars) and tried to draw useful conclusions for the eventual liberation of his enslaved compatriots.

Korais's concern for Greece remained unwavering throughout his long life. He was particularly concerned with the educational level of his compatriots and the necessary reforms in the school curricula and the teaching methods on the model of "enlightened Europe". Korais realized that the prestige and the international reputation of a nation (e.g. France) depended heavily upon its scholarly and scientific achievements. This was his dream for Greece too. Korais thus proclaimed the notion of *metakenosis*, i.e. the pouring of the acquired wisdom of the West into the Greek vessels of his day. In this way knowledge had been earlier transferred from ancient Greece to the West and had contributed immensely to the achievements there.

Korais was also very critical of the widespread habit of polymathy and stressed the need for more specialized knowledge and expertise that could lead to pathbreaking scholarly achievements. He especially criticized the outdated, arid tradition of teaching grammar and related lessons in Greek schools, which ended up offering nothing useful to the students. His own editorial programme of ancient Greek authors was intended to provide modern Greeks with practical principles and truths that could lead to Greece's regeneration and eventually to its liberation. Korais's final objective was the creation of a well-ordered society, in which happiness, virtue, law, and freedom would reign. He also showed a keen interest in the controversial issue of Greek language, the development of which was absolutely necessary for his compatriots in order to express better their thoughts. Korais tried to find a middle way between the archaizers and the vulgarizers. His own preference for Greek idiom later exerted some influence upon the formation of the simple katharevousa, a largely artificial language that had become the subject of serious debate.

Aside from this, Korais was a vehement opponent of the slavery of thought, especially regarding socially established, old-fashioned perceptions and clerical impact. He was particularly interested in limiting the Church's power and social influence, which were inhibiting Greece's intellectual emancipation and political independence. He also defended his country against accusations about the illiteracy of Greeks made by

Western travellers such as J.L.S. Bartholdy. Among his relevant works, the lecture *Mémoire sur l'état actuel de la civilisation dans la Grèce* at the Société des Observateurs de l'Homme in 1803 must be mentioned here. Yet, when addressing himself to his compatriots, Korais was far more critical and demanding, for he aimed to eradicate all the wrongs that were keeping Greece apart from the civilized nations.

Korais's range of writings and translations is impressive. Apart from his early religious output, Korais wrote on medical issues and published several tracts of patriotic and political content with regard to the Greek cause and the institutions of the new-born Greek state. His greatest achievement was undoubtedly the systematic edition of ancient Greek writers starting in 1799 with Theophrastus's *Characters*. Korais wrote extensive prolegomena and annotations to each volume and discussed burning questions concerning Greek education and language. In addition, there exist several other treatises by Korais (e.g. his Greek translation with notes of Beccaria's *Dei delitti e delle pene* in 1802; 1823) as well as collective volumes containing his numerous shorter texts. Korais also left various other works, which were published posthumously. Finally, his voluminous correspondence, with Greeks and foreigners alike, attests to the wide range of his interests and activities as well as to his total devotion to the Enlightenment and the liberation of the Greek people. Korais had a special interest in coordinating the diaspora Greeks, such as Alexandros Vasileiou in Vienna and Iakovos Rotas in Trieste, with those in the Ottoman empire. He was also concerned to improve the educational status of Chios, the birthplace of his father, and collaborated with many of its residents to that end. The gymnasium of Chios was eventually the sole inheritor of Korais's books and papers. It is also in this island that a rich library exists today bearing his name.

Serious criticism of Korais's opinions, especially on religious matters, was voiced by the patriarchate of Constantinople as well as by other religious circles (e.g. Athanasios Parios). Korais's influence was feared even after the foundation of the Greek state and his opinions were held responsible for the radical changes regarding the Orthodox Church (e.g. the unilateral declaration of the autocephalous Church of Greece in 1833). Orthodox Christians were also occasionally admonished to avoid reading Korais's books. Korais was neither an atheist nor an enemy of Christianity, but he was seriously influenced by the Enlightenment on religious issues. In this respect, his opinions were not in conformity with traditional Byzantine Orthodoxy. Yet, Korais's intention was not to abolish, but to reform and rationalize Orthodoxy. Thus, he put far more emphasis on the social utility of Orthodoxy while criticizing its otherworldly orientations. He supported the translation of the scriptures into modern Greek. He disagreed strongly with the irrational use of religion and its superstitious practices that were hindering social progress. Finally, he exhibited a bitter anticlerical spirit, since he thought that the unworthiness of many Orthodox prelates, priests, and monks was the source of many problems in Greek society.

In short, Korais left an indelible mark upon the intellectual life of Greece not only in his lifetime, but down to the 20th century. It is no wonder therefore that he has had ardent supporters and admirers as well as militant and fanatical opponents. The issues involved in these debates range from religious and linguistic to social and political. The ideological uses of Koraism in the 20th century were multiform and diverse. Korais was turned into the main opponent and enemy of various political, philosophical, philological, and Orthodox theological circles. This phenomenon constitutes further evidence, even if indirectly, of Korais's lasting impact upon and legacy to modern Greece.

Biography

Born in Smyrna in 1748, the son of a merchant from Chios, Korais worked for the family business in Amsterdam from 1771 to 1777. From 1782 to 1787 he studied medicine at Montpellier but he was much more interested in Classical scholarship. In 1788 he moved to Paris and lived there for the rest of his life. His aim was to publish a Hellenic Library of Classical texts for Greek readers and to introduce the ideas of the Enlightenment into the Greek curriculum. He died in 1833.

Kornaros, Vitsentzos 1553–*c.*1614

Cretan poet

Vitsentzos Kornaros occupies a position of undisputed importance in the history of modern Greek literature and is one of the major literary figures of the Cretan renaissance. His poetic romance *Erotokritos* draws on the plot conventions of medieval romance but tempers the action and characterization to Renaissance modes of thought, while elevating the Cretan dialect in which it is written to a sophisticated literary tool of great expressiveness and musicality. Kornaros is also widely believed to be the author of the anonymous religious drama *The Sacrifice of Abraham*, which exhibits a number of verbal and stylistic similarities with *Erotokritos*. There is now general agreement among scholars that Kornaros, who gives brief autobiographical details at the end of *Erotokritos*, was a member of the Hellenized Veneto-Cretan noble family of Cornaro (or Corner), which had been established in Crete since the 15th century. Vitsentzos (or Vicenzo) was born in the village of Trapezonta, near Siteia, in 1553. In 1590 he married Marietta Zeno, in the capital Kastro where he was by then living, and they had two daughters. His brother Andrea was a major intellectual figure in the Crete of his time, author of an unpublished history of Crete and founder of the academy of the Stravaganti, of which Vitsentzos was also a member. Vitsentzos occupied various legal and administrative offices, making the kind of contributions to public life that were expected of a member of his class. He died in 1613/14.

Erotokritos was completed within the last 20 years or so of Kornaros's life. It is preserved in an illustrated manuscript, written in the Ionian islands in 1710 (now in the British Library), and in printed editions from 1713 onwards. The poem draws its plot from the French romance *Paris et Vienne*, by Pierre de la Cypède. The immediate model of the Cretan poem is an Italian prose version of the romance, first printed in 1482. Kornaros completely alters the setting and atmosphere of his Italian source, by removing the Christian context and transferring the story to ancient Athens, but with a deliberately diachronic (or rather anachronistic) perspective. The heroine, Aretousa, is the daughter of the king and queen of Athens, while in the tournament which occupies the second of the five books the participants include a prince of Byzantium and noblemen from various parts of the east Mediterranean world: Crete, Cyprus, Naxos, Patras, Mytilene, Methoni, Koroni, Nauplia, Egripos (Euboea), Macedonia, etc. Many of these places had (or once had) a particular importance in Venice's colonial empire. There is also a Karamanite (a Turk), who challenges the Cretan Charidimos to a duel, a possible allusion to the battle of Lepanto (1571).

The poem consists of 9982 lines of couplet-rhymed 15-syllable verse, divided into five parts or books. The plot is articulated after the manner of a five-act Neoclassical drama (Alexiou refers to its "daring mixture of genres"); almost half of the poem consists of the direct speech of the characters, although the story is told by an omniscient narrator who is the poet's mouthpiece. The hero Rotokritos (his name appears most commonly in this form) is the son of the king's counsellor; his love for Aretousa and the obstacles he has to overcome in his quest to prove himself a worthy match for the princess constitute the main axes of the plot. Book 1 is about the gradual development of his love (punctuated by the warnings of his friend Polydoros), and the response of Aretousa, first for an unknown admirer who serenades her, and then, with the discovery of Rotokritos' identity, her growing passion for the young man himself, despite the strong disapproval of her nurse Frosyni. In book 2 a tournament organized by the king partly to entertain his daughter and partly to find her a suitable husband of royal birth (the prince of Byzantium is the favoured suitor), provides Rotokritos with the opportunity to prove himself. He is victorious, after overcoming various opponents in the jousts and finally defeating the Cypriot Kypridimos, who has declared himself implacably opposed to Eros. The way is thus open for Rotokritos (in book 3) to persuade his father to approach the king on his behalf. However, the king will not hear of a marriage to a commoner and angrily banishes Rotokritos, who takes his leave of Aretousa with mutual declarations of eternal love. In book 4 Athens is at war with the neighbouring kingdom of Vlachia. Rotokritos, disguised as a Negro, comes to the king's aid in the battle, and saves the kingdom by killing the Vlach champion in singlehanded combat. He is gravely wounded but, in the final part, slowly recovers and is offered a reward. Still in disguise he visits Aretousa in the cell in which her suspicious father has confined her. He tests her fidelity by alleging that her beloved Rotokritos is dead, but finally reveals his true identity. Their union is blessed by the king and the story ends with the celebration of their marriage.

This typical romance plot of separated lovers and eventual reunion derives much of its attraction from its poetic diction. Recurring imagery of fire and organic growth elaborates the love theme. Some scholars have found it long-winded and pedestrian, overlooking the subtlety of the metaphors and similes, the rhetorical construction, and the complex network of allusion and irony. Echoes of Ariosto and the Petrarchistic conceits of Italian Renaissance poetry abound, but the "naturalness" of the poem's language and style has led some scholars to see affinities with Greek folk poetry. It is certainly true that, after it was first printed in Venice in 1713, it circulated widely in the Greek-speaking world and became extremely popular. It is often claimed, probably with some exaggeration, that many Cretans knew the entire poem by heart. What is certain is that particular episodes are still frequently sung to a traditional tune, and the poem is held in great affection by the Cretan people; it also seems to have influenced the popular tradition of improvised couplets (*mantinades*). However, its reception has extended well beyond Crete: Solomos was familiar with it and assimilated its style in his own poetry, particularly in "The Cretan", which contains echoes of the episode featuring the Cretan in book 2. An adaptation into more learned language was published by Dionysios Foteinos in 1818. Angelos Sikelianos, George Seferis, Nikos Kazantzakis, and Yiannis Ritsos are among 20th-century poets who have exploited the poem creatively in their own work (Seferis also wrote an important essay on it). There have also been successful musical settings of *Erotokritos*, as well as theatrical adaptations.

The Sacrifice of Abraham, if it is indeed the work of Kornaros, was written before *Erotokritos*, but after 1586, the date of the first edition of the Italian play *Lo Isach*, by Luigi Grotto, on which it is based. Like most works of Cretan renaissance literature, it is in rhymed 15-syllable verse. The subject matter of the play is the biblical story of God's testing of Abraham's faith by the commandment that he sacrifice his only son Isaac (Genesis 22). The action is spread over at least six days: it begins with the angel's announcement to Abraham of God's command, progresses to the dramatic scene on the mountain, and ends with the return home and the joyful family reunion. The Cretan play improves on the dramatic structure of its model, gives more emphasis to the nature of Abraham's inner struggle, and enhances the roles of the servants. Also notable is the emphasis on family relations, seen in the characterization of Isaac: his mature understanding of his father's dilemma and eventual compliance in the sacrifice, and his concern for his mother. Sarah is depicted with particular tenderness, most notably in her lament for her son, which exhibits a dialogue with popular motifs and themes. The Cretan work represents a sustained attempt to interpret the biblical story for contemporary man. The playwright was clearly interested in theological matters and may have known the work of Origen. The play, which could be classified as a *tragedia di lieto fin*, is not divided into acts and scenes in the extant witnesses (unlike Grotto's play), but none the less has a firm dramatic structure. It is preserved in two manuscripts and in a series of printed editions from 1713 onwards (an edition of 1696 has not survived). As the frequency of these editions shows, it was one of the most successful vernacular literary texts of the 18th and 19th centuries. It was also translated into Turkish in 1783 (printed 1800), for the use of Turkish-speaking Orthodox Christians.

Kosmas the Aetolian, St 1714–1779

Orthodox missionary and martyr

St Kosmas the Aetolian is called "equal to the Apostles" and "teacher of the Greek nation" for his contribution to the spiritual and national awakening of the Greek people in the late 18th century. Not officially canonized by the Orthodox Church until 1961, Kosmas has long been venerated in Greece, Albania, and the southern Balkans as one of the "new martyrs of the Turkish yoke". Through his missionary work Kosmas promoted the study of the Orthodox Christian religion and the Greek language. In this way Kosmas helped prepare the Greeks to overthrow the Ottoman Turks and establish their own independent state in the 19th century.

The son of weavers, Kosmas was a native of the Aetolian region of northwestern Greece, in the vicinity of Arta. He pursued an education for himself, eventually enrolling in the Theological Academy on Mount Athos in 1749. Although Kosmas became a hieromonk at the monastery of Philotheou, he sought and was given permission by his fellow monks and patriarch Seraphim II of Constantinople (1757–61) to leave the monastery and become an itinerant preacher. He wanted to bring his knowledge of the gospel, the Church Fathers, and the spiritual life of Mount Athos to the common people.

Attracting huge crowds as he travelled, Kosmas preached using the vernacular Greek language so that everyone could understand his message. But he encouraged the establishment of local schools for the study of the Orthodox Christian faith and the more archaic Greek of the scriptures and the Church. Kosmas is remembered as saying: "My beloved children in Christ, bravely and fearlessly preserve our holy faith and the language of our Fathers, because both of these characterize our most beloved homeland, and without them our nation is destroyed" (Vaporis, 1977, p.146). Kosmas did his best to address the economic, social, and religious pressures which enticed many Orthodox Christians to convert to Islam. He himself lived in apostolic poverty and defended the poor and women against exploitation and abuse. Although his preaching threatened the status quo, Kosmas did manage to attract some wealthy patrons who contributed ecclesiastical items for the benefit of the poor: religious books, prayer ropes, little crosses, haptismal fonts, head coverings, beard combs, candles, bread, and boiled wheat. Kosmas would ask the people to prepare for his visits by confessing their sins, fasting, and holding a vigil service. When he arrived he would typically ask that the sacrament of Holy Unction be performed, then he would preach, and finally the faithful would partake of the *antidoron* (blessed bread) and *kollyva* (boiled wheat consumed at memorial services) forgiving the living and the dead. Because of the crowds, Kosmas often preached outdoors. He would ask the people to set up a wooden cross at the spot where he would preach, and stood on a portable footstool. The cross would remain at the site after he left. According to his disciple and hagiographer Sapphiros Christodoulidis (d. 1856), Kosmas began to effect miracle cures through his preaching. But the power of the holy man could curse as well as bless – Christodoulidis also reports harm coming to those who wanted to hurt the saint or who were disrespectful of his teaching and counsel.

The content of his teaching stressed religious education, repentance, forgiveness, fasting, humility, the dignity of women and marriage, love of God and of one's neighbour. He also brought the Athonite practice of the Jesus prayer to the common people, advising them to pray at all times: "Lord Jesus Christ, Son and *Logos* of the living God, by the intercessions of the Theotokos and all the saints, have mercy on me the sinner and unworthy servant of Thee" (Cavarnos, 1985, p.71). He discouraged Christians from doing business on Sundays, which brought him into conflict with local merchants.

The saint's teachings, prophecies, and martyrdom cannot be understood apart from the political situation of the Greeks under the Tourkokratia in the late 18th century. As much as he preached love, Kosmas fought to promote the continuation of Greek identity by stressing the two things that set the Greeks apart from their neighbours – Roman Catholics, Jews, and Turkish Muslims: the Greek language and the Orthodox Christian religion. He stood firmly within the tradition that saw the rule of the Turks as a chastisement for the sins of the Greeks, but one in which God's mercy was manifest: "And why did God bring the Turks and not some other race? For our good, because the other nations would have caused detriment to our Faith" (Cavarnos, p.23). In fact, Kosmas always asked for permission to preach from both the local bishop and the Turkish authorities as he travelled from town to town. Although his reputation as a holy man earned him admirers across religious lines, it was easy for the authorities to believe that Kosmas and his followers were aligned with the Russian government in an effort to free the Orthodox Christian population of the Balkans from Ottoman rule. He spoke often of Antichrist and the end of the world, and predicted the libera-

tion of Greece within three generations of the one then living. It is no surprise that St Kosmas met his end through martyrdom at the hands of Turkish executioners. While visiting an Albanian town called Kolikontasi or Kalinkontasi he was seized by the agents of the local governor, Kurt Pasha. On 24 August 1779 Kosmas was hanged en route to the governor's residence in Berati (Berat), Albania. "Thus the thrice-blessed Cosmas, that great benefactor of men, became worthy of receiving, at the age of sixty-five, a double crown from the Lord, one as a Peer of the Apostles and the other as a holy Martyr" (Christodoulidis, in Cavarnos, p.45). His body was thrown naked into a river with a stone weighted around his neck. For three days the local Christians searched for the body, until a priest from the monastery of the Presentation of the Most Holy Theotokos near Kolikontasi miraculously discovered it floating upright in the river. His body was then buried at the priest's monastery. A church in his honour was later built at the site, with the encouragement of the vizier Ali Pasha of Tepeleni, whose rise to power the saint had prophesied 30 years earlier.

St Kosmas the Aetolian has made an enormous impact on the national and spiritual consciousness of the Greek people. In the 19th century the Greeks won their national independence and experienced a spiritual revival led by itinerant preachers inspired by the saint's example. He continues to inspire both piety and scholarship – one bibliography published in 1968 lists over 30 books and 600 articles devoted to St Kosmas (Cavarnos, p.27), although works in the English language remain scarce. Thirteen of his letters survive, as well as the sermons recorded by his disciples collectively called "Didachai" ("Teachings"), which were read in churches during his lifetime and after his death. His feast is celebrated on the anniversary of his martyrdom, 24 August.

Koukouzeles, St John

Musician of the 13th-14th centuries

St John Koukouzeles is honoured by the Greek Orthodox Church as the "second source" (after St John of Damascus) of its liturgical music. Far from being mere hagiographic hyperbole, this appellation accurately reflects the decisive impact of his labours as a maistor (musical director), composer, hymnographer, scribe, editor, teacher, and theorist during the late 13th and early 14th centuries. Information about his life and career may be derived mainly from two groups of sources: the very large number of musical manuscripts containing his work, the first of which date from the beginning of the 14th century; and the copies of a late and somewhat problematic *Life*, the oldest manuscript of which (Thessalonica, Vlatadon 46) dates from the second half of the 16th century. From the former we learn that his surname was Papadopoulos, that he studied with Xenos Korones under the cantor John Glykes, and that his name was changed to Ioannikios when he became a monk of the Great Schema. The *Life* contains none of these details, but begins by relating how he was born in Dyrrachium to a Slav mother, was taken to study chant in Constantinople, acquired the surname Koukouzeles (supposedly from the words for beans and cabbage), and composed a setting of Psalms 134 and 135 (the "Polyeleos") entitled *Voulgara* on a return visit to his mother. The remainder of his *Life* covers his removal to the monastery of the Great Lavra on Mount Athos, his construction of a chapel dedicated to the Archangels (still extant) outside the monastery walls for the practice of hesychasm, the miracles he experienced, and his death. Modern scholars, however, tend to view the *Life* with mild to extreme scepticism. In addition to containing improbable episodes and dubious etymologies, it is suspiciously similar to that of Gregory the Domestikos, a cantor from the Great Lavra who shares the feast day of 1 October with his contemporary Koukouzeles. Furthermore, Koukouzeles seems never to have written a Polyeleos *Voulgara*, the story being derived from the misattribution of a single Psalm verse by Glykes (Jakovlević, 1982). Nevertheless, most scholars have not followed Erich Trapp (1987) and Simon Karas (1992) in their near total rejection of the *Life*, choosing instead to accept with caution its story of Koukouzeles' monastic vocation.

Regardless of the controversies over his biography, the quality, variety, and wide distribution of Koukouzeles's works are more than sufficient to secure his special place in Byzantine musical history. To Byzantine musical theory he made two substantial contributions: the didactic chant "*Ison, oligon* ..." (known popularly as the *Mega Ison*), a revision of a similar work by Glykes illustrating the standard repertory of melodic figures (*cheironomiai*); and a diagram (the *trochos*, "wheel") illustrating the relations between the modes with a series of concentric rings surrounded by four smaller circles bearing his surname. Koukouzeles also re-edited the entire central repertory of chants for the three Byzantine Eucharistic liturgies and the Palestinian Divine Office of St Sabas into three volumes. To the traditional anonymous melodies of the Eirmologion and the Sticherarion, two venerable collections of hymns (*eirmoi* and *stichera*) for the Sabaïtic offices, he made only relatively minor revisions. Rather, his most distinctive and influential

work is to be found in the Akolouthiai or "Orders of Service", a new type of musical manuscript that, for the first time, combined under a single cover all the ordinary chants and psalmodic propers of the Byzantine monastic offices and Eucharistic liturgies. Some copies of the Akolouthiai – of which dozens survive, the earliest being MS Athens 2458 in the National Library of Greece, dated "1336" – begin with a section of theoretical and didactic works. After these one inevitably finds a stylistically broad variety of traditional and newly composed chants, including: anonymous and, for the most part, previously unnotated syllabic, semi-florid, and melismatic melodies, some of which may be supplied with regional (*Agiosophitikon*, *Thessalikon*, etc.) or functional (monastic, cathedral, etc.) variants; and a much larger body of highly individual and often virtuosic chants by Koukouzeles and his late Byzantine colleagues.

It is among the newly composed chants of the Akolouthiai that one finds the melodies on which Koukouzeles' reputation as a composer rests. Encompassing many liturgical genres, these works include verses for the psalms of the all-night vigil, hymns for the eucharistic liturgies, festal hymns – both traditional and new texts, including those from his own pen – for the liturgy of the Hours, and optional codas to traditional hymns and responsories. A great number of these compositions are in the extremely florid "beautified" or "kalophonic" idiom, which is generally characterized by vocal virtuosity, but could also include textual troping, highly melismatic passages, and even textless vocalizations on nonsense syllables ("teretisms"), some of which exist as independent pieces (*kratemata*) bearing evocative names (e.g. *viola*). Although this style of composing antedated him by at least two generations, Koukouzeles brought it to maturity and then succeeded in disseminating it widely through his compilation of the Akolouthiai. The result was what Edward V. Williams has fittingly described as a "Byzantine *ars nova*", whereby Koukouzeles established the stylistic parameters for all subsequent composers of Greek Orthodox chant.

From the 14th to the early 19th century Koukouzeles's works were continuously copied both as originally notated and in florid realizations ("exegeses") by post-Byzantine cantors. His continued popularity is also reflected by the dissemination of his *Life* in multiple recensions and the early adaptation of some of his compositions for performance in Church Slavonic. In the early 19th century a large number of his works were transcribed melismatically into the "New Method" of Byzantine notation by Chourmouzios the Archivist and other exegetes. Perhaps due to their extreme length after being subjected to "exegesis", only a fraction of these were subsequently published, the most prominent of which are his chants for the vesting and entrance of a bishop, the *Mega Ison*, a single Sunday communion verse, and his farced verses for Psalm 103 ("the Great Anoixantaria"). In recent years, however, Greek scholar-performers have begun to explore the unpublished works of Koukouzeles, resulting in an increasing number of recordings and publications.

ALEXANDER LINGAS

Biography

According to an anonymous *Life* (of dubious authority), John was born in Dyrrachium to a Slav mother in the second half of the 13th century. Taken to Constantinople to study chant, he acquired the name Koukouzeles. He then moved to the Great Lavra monastery on Mount Athos, where he died. He is regarded as the "second source" (after St John of Damascus) of liturgical music for the Greek Orthodox Church and worked as musical director, composer, hymnographer, scribe, editor, teacher, and theorist.

Kritoboulos, Michael

Historian of the 15th century

Michael Kritoboulos of Imbros was one of the four 15th-century Byzantine historians (the others are Laonikos Chalkokondyles, George Sphrantzes, and Doukas) who left an account of the fall of Constantinople to the Turks in 1453. His approach of making the rise of the Turks the main theme of his history parallels that of Chalkokondyles. Kritoboulos, however, stands out for his glorification of Mehmet the Conqueror and for his attempt to find an accommodation with the Turks.

Very little is known about Kritoboulos's life, apart from his career in the Ottoman administration after 1453. The original family name of Kritoboulos must have been Kritopoulos, but was later changed in a classicizing fashion to Kritoboulos. It is possible that the historian was identical with the religious

writer Michael Kritopoulos, who composed an unpublished homily on the Passion of Christ. The Italian traveller and humanist Cyriac of Ancona, who visited the island of Imbros in 1444, called Kritoboulos a "most learned and noble man". Kritoboulos seems to have belonged to those strata of the Greek political and intellectual elite who readily accepted and were willing to serve the new Ottoman masters. After the Ottoman conquest of Constantinople, Mehmet II the Conqueror (1451–81) appointed Kritoboulos governor of the island of Imbros. In this capacity Kritoboulos negotiated the withdrawal of a papal fleet that had occupied the neighbouring islands of Lemnos and Samothrace in 1457. He was also involved in the expulsion of the Genoese from the island of Lemnos in 1260, which Mehmet then conferred briefly as an appanage on Demetrios Palaiologos, brother of the last Byzantine emperor Constantine XI Palaiologos (1449–53). When the Venetians besieged Imbros in 1466, Kritoboulos withdrew to Constantinople. He survived the plague in the following year, but seems to have lost Mehmet II's favour and to have withdrawn to a monastery on Mount Athos.

Surviving in a single manuscript in Istanbul (Topkapi Sarayi, Cod. G.I.3), the history of Kritoboulos covers events in the period 1451–67 and is an important source on the transition of power from the Byzantine to the Ottoman empire. It is dedicated personally to Mehmet the Conqueror and its primary focus is on the Turks. In a way that is analogous to his career in the Ottoman administration, Kritoboulos sought to emphasize elements of continuity with Byzantium. Indeed, he portrayed Mehmet the Conqueror, the main hero of the history, as a Byzantine emperor reborn. In his history Mehmet II bears the Byzantine imperial titles of *basileus* ("king") and *autokrator* ("emperor"), and the historian has ascribed to him patterns of behaviour expected from a Byzantine emperor. In order to make him a worthy successor of the Byzantine rulers, Kritoboulos emphasized Mehmet's interests in Classical antiquity during the sultan's visit to Athens and Troy. The preface to the history compares the Conqueror directly to Alexander the Great and to the emperors of Rome. The characteristics attributed to Mehmet II include centuries-old elements of Byzantine imperial ideology and propaganda, such as the ruler's foresight and care for his subjects, his philanthropy, his piety, his justice, his generosity, etc. Even the vindication of his expansionist wars corresponds to the Byzantine concept of the just war. Kritoboulos emphasized that the enemies of Mehmet II were always first to provoke armed conflicts, while the sultan's role in war was mainly responsive. In his description of the fall of Constantinople Kritoboulos stresses the sultan's mercy towards the inhabitants and praised him for rebuilding and repopulating the capital. If anyone deserved Kritoboulos's critical judgement, it was the Italians and primarily the Venetians. Unlike most of his Greek contemporaries, however, Kritoboulos despised the Latins, not for religious reasons, but because they were the main enemies of the Turks for naval hegemony in the Aegean basin.

Nevertheless, Kritoboulos retained much respect for his fellow Greeks and for Hellenic culture. He found it necessary to apologize to his contemporaries and to future readers for putting the Turks and their sultan in the centre of his history. He admired the last Byzantine emperor Constantine XI Palaiologos and the heroic defence of Constantinople that he led. Furthermore, he took pride in the fact that his work was written in Greek and he pointed out that this was a language widely spoken and studied during his time. For this reason Kritoboulos thought that his history would have a much wider readership than contemporary Ottoman chronicles. He wrote in a classicizing style and imitated Thucydides' *History of the Peloponnesian Wars*. This forced antiquarianism reveals the unceasing importance of the study of Hellenic culture for those Greek thinkers and literati who worked after the fall of Byzantium. Even people like Kritoboulos, who sought accommodation with the Ottomans, drew their literary models and their sense of cultural identity in the distant Hellenic past.

Kritoboulos blamed the demise of Byzantium partly on the bad qualities of its emperors. However, he found the chief explanation, and perhaps even some consolation, in the historical law of the inevitable rise and fall of states. This philosophical consideration not only exonerated Kritoboulos's compatriots who lived through the fall of the Byzantine empire and became adapted to the Ottoman regime, but also held certain, albeit small, hope for the future.

DIMITER G. ANGELOV

See also Historiography

Biography

Little is known of the life of Kritoboulos, who was living on the island of Imbros when Cyriac of Ancona visited him in 1444. After the fall of Constantinople in 1453 he joined the Ottoman administration and Mehmet II made him governor of Imbros in 1456. Ten years later he returned to Constantinople, where he died. His history of the years 1451–67 is written from the Ottoman perspective.

1926–1997	Livanos, George P.
1935–	Angelopoulos, Thodoros

NOTE ON TRANSLITERATION

Transliteration is always a problem when dealing with a non-Roman alphabet across such a vast span of time and space, and it is as impossible to please everybody as it is to be consistent within the rules one has set. But, on the principle that good transliteration like good writing is by definition inconspicuous, the aim throughout has been to present the reader with the form of any word which is likely to be the most familiar and least jarring. In general, ancient names have been presented in their "Latin" form (e.g. Thucydides), but medieval and modern names in their "Greek" form (e.g. Alexios I Komnenos). Since a point in time had to be chosen for the switch from "Latin" to "Greek" forms, that (entirely arbitrary) moment is taken to be the death of Justinian I (14 November, 565) who was probably the last Byzantine emperor to speak Latin. Greek is always transliterated into the Roman alphabet. Here again the more usual "ancient" system (e.g. *basileus*) is employed until (simply because a date had to be chosen) 1453 when the switch is made to the "modern" system (e.g. *vasilefs*). Places that have a standard ancient (or English) form (such as Thessalonica or Athens) retain that form throughout. Nevertheless inconsistencies and infelicities are inevitable and we can only crave the reader's indulgence where they occur.

GRAHAM SPEAKE

The Greek Alphabet

Capital	*Lower Case*	*Name*		*Transliteration (pre-1453/post-1453)*
A	*α*	Alpha	=	*a*
B	*β*	Beta	=	*b/v*
Γ	*γ*	Gamma	=	*g* (hard, as in "good")
Δ	*δ*	Delta	=	*d*
E	*ε*	Epsilon	=	*e* (as e in "net")
Z	*ζ*	Zeta	=	*z*
H	*η*	Eta	=	*e* (as ee in "meet")
Θ	*θ*	Theta	=	*th*
I	*ι*	Iota	=	*i*
K	*κ*	Kappa	=	*k*
Λ	*λ*	Lambda	=	*l*
M	*μ*	Mu	=	*m*
N	*ν*	Nu	=	*n*
Ξ	*ξ*	Xi	=	*x*
O	*ο*	Omicron	=	*o* (as o in "spot")
Π	*π*	Pi	=	*p*
P	*ρ*	Rho	=	*rh, r*
Σ	*σ ς*	Sigma	=	*s* (*ς* when final letter)
T	*τ*	Tau	=	*t*
Y	*υ*	Upsilon	=	*u/f* after *a* and *e*
Φ	*φ*	Phi	=	*ph*
X	*χ*	Chi	=	*ch* (hard, as in "chord")
Ψ	*ψ*	Psi	=	*ps*
Ω	*ω*	Omega	=	*o* (as o in "lone")

Constantine XI Palaiologos	1449–1453

**Constantine III was a usurper emperor in the western empire, 407–411*

L

Laconia

Region of the southeastern Peloponnese

The district of Laconia – Homer's "hollow Lacedaemon" – occupies the southeastern part of the Peloponnese, around the valley of the river Eurotas. To the west is the mountain range of Taygetus, the highest in the Peloponnese, whose summit is usually snow-covered at least into May. To the east is the Parnon range, which runs southwards to the peninsula of Malea. In the Homeric poems this is the homeland of Menelaus, brother of Agamemnon and husband of Helen whose abduction by the Trojans was the whole cause of the siege of Troy. Menelaus is the second-rating, after his brother, of the Argive kings, which would lead one to expect in Laconia a Bronze Age palace and citadel comparable with that at Mycenae, and at least the equal of the "Palace of Nestor" in neighbouring Messenia. If such a palace existed, it has not been found, though, adjacent to a natural mound on which in Classical times the shrine of the deified Menelaus and Helen was situated, there is a sequence of Late Bronze Age structures of some quality, not, however, palatial in scale. This, like other Mycenaean sites in Laconia, was destroyed about 1200 BC, at which point Laconia relapsed into total obscurity and, it would seem, was largely denuded of its population.

At least two centuries later, and probably not before the middle of the 10th century BC, Dorian newcomers settled in the upper reaches of the Eurotas, about 50 km from the sea, opposite the site of the Mycenaean buildings, but on lower ground. Here they formed a group of villages which collectively became the Classical city state of Sparta though, as Thucydides famously pointed out in the introductory chapters of his *History*, even at the end of the 5th century BC physically the city remained nothing more than a collection of villages. Four of them formed the city itself, while a fifth was politically part of the same city state structure, at Amyclae, a short distance to the south. The institutions of the Spartans, similar to those of the Dorian settlers in Crete, remained notoriously distinctive and primitive through the Classical period. They retained, almost to the end of their independence, a curious dual kingship, the reasons for which can only be guessed at. The purpose of these institutions was to create and sustain a military elite, the Spartiates, who alone had full citizenship rights, and with this to establish and maintain a supremacy which was extended, probably by the end of the 8th century BC, over the whole of Laconia, and in the following century crossed the mountain boundary of Taygetus to incorporate Messenia. Outside Sparta the population of Laconia comprised two categories: the Helots (a term which probably denotes that they were "prisoners"), who worked the land – to which they were tied – on behalf of Spartiate landlords, who were thus freed from labour to pursue their military functions; and the *perioikoi*, the "dwellers round" who were free, living in their own communities, but subject to Spartan control and under an obligation to render military support when called on to do so (the same distinctions were extended into conquered Messenia).

The land round Sparta is extremely rich agriculturally; fertile alluvium, well watered by streams fed by the melting snow on the mountain, running into the Eurotas and making it a river which continues to flow throughout the summer. For this reason, at the present day the district has suffered less than most parts of Greece from rural depopulation – with virtually all basic commodities produced locally there is less incentive to migrate to Athens. Conversely, the promontory at the southern end of Taygetus, the Mani, is desperately poor land, with much consequent migration, particularly to Australia. It was undoubtedly the wealth of the land round Sparta that led to it becoming a major city of Classical Greece, though situated at such a distance from the sea.

The communities of *perioikoi* were more varied. Some, like Geronthai (modern Geraki) southeast of Sparta, had long antecedents, but being in areas with poorer agricultural resources could never achieve the power of Sparta, and were satisfied to be part of the Spartan system (conversely, the reason they were not reduced to Helot status was probably that their land was less desirable to the Spartans). Other such communities served more specialized functions, the most important of these being Gytheum, which was the chief harbour town.

Despite being so far inland, Sparta experienced the same artistic development as the other leading areas of Greece in the 8th and 7th centuries BC, resulting from the renewal of overseas trade. Goods imported from the Near East are found there, while Laconian pottery evolved into a distinctive style, after the dull wares of the Dark Age, and was exported to north Africa (Cyrene) and south Italy, where Taras (Tarentum, modern Taranto) was a Spartan colony. There is good evidence

for the development of Spartan poetry, and the creation of the shrine to Menelaus and Helen, the Menelaion, on the mound which looks as though it were their tomb (though in reality it is a natural outcrop of rock) shows that the Spartans of the 8th and 7th centuries were well aware of the Homeric poems and the story of the siege of Troy. It was probably the difficulties of maintaining control over rebellious Messenia – another source of wealth – which in the later 7th and 6th centuries caused the Spartans to turn their back on this development, and reinstate with great rigidity (to the curiosity of progressive Greeks, such as the Athenians) the primitive militaristic training and regime for which they became notorious.

After the defeat of the Spartans by the Boeotian League in 371 BC, and the consequent loss of Messenia, Sparta dwindled in political importance; but the potential strength of Laconia was realized once more, after 150 dormant years, when king Cleomenes III carried out a redistribution of the land, and so recreated a substantial citizen army, only to be defeated by the Macedonian army of Antigonus Doson.

In Roman times Laconia became a quiet backwater, enjoying some imperial and other external patronage. Substantial theatres were built at Sparta and Gytheum, and the mosaic pavements of Spartan houses attest to a comfortable standard of living. In the troubled later Roman period fortifications, incorporating the theatre, defended only a reduced area. The city was sacked by Alaric in AD 396, but survived, though the later habitations built over the theatre are wretchedly squalid. Laconia, however, remained a vitally important area, though in the Middle Ages the centre of interest shifted to Mistra, the stronghold city on the foothills of Taygetus. Originally a Frankish foundation, Mistra was recovered by the Byzantines, and blossomed as a centre of late Hellenic culture, where George Gemistos Plethon's teachings took Platonism as the means to emphasize an intellectual continuity from the Classical world. Mistra, in turn, dwindled under Turkish occupation, though still equipped with a splendid series of late Byzantine churches. With the freeing of Greece after the War of Independence, the attempt to recreate the Classical cities led to the redevelopment of a modern city on the approximate site of Sparta. With its inevitable grid plan of streets, and an imposing Neoclassical town hall, splendidly restored in recent years, Sparta remains a relatively small but very prosperous market town for Laconia, whose good land now grows citrus fruit in abundance (the small town of Hagios Stephanos has an annual Festival of the Oranges): the perioikic land of Geraki is devoted largely to olive groves.

Summary

A district in the southeastern part of the Peloponnese, Laconia was prominent in the Bronze Age as the traditional homeland of Menelaus. In the 10th century BC Dorians settled a group of villages that later became the Classical city state of Sparta. Defeated by the Boeotian League in 371 BC, Sparta lost power; but Laconia rose again briefly under Cleomenes III. In the late Byzantine period Mistra blossomed as a centre of Hellenic culture.

Land tenure

Throughout the history of the Greek people access to use and ownership of arable land has been a central concern. The classical polis restricted land ownership to those who were citizens and, more often than not, refused full political rights to those who were too poor to own land. In the countryside the transition from ancient civilization to Byzantium was marked by the gradual disappearance of the small freeholder who worked his plot with the assistance of chattel slaves, and the spread of a class of technically free persons who were only conditional cultivators of the property of large landholders. Increasingly exploitative practices under the Ottoman rulers resulted in the virtual depopulation of many areas of rural Greece, and it was not a simple matter for the first post-independence governments to create the conditions under which land could be distributed and made productive again.

In exploring the question of land tenure from the 8th century BC to modern times certain issues keep recurring. Could one alienate land? What laws of inheritance applied to land? Does the payment of taxes or rent imply a less than full ownership of the land? In addition to exploring these rather legalistic issues, one must also keep in mind a recurring theme in Greek beliefs about landholding: the most desirable state of affairs is for all citizens to have roughly the same amount of land. Social and legal mechanisms which tend to work against the formation of large estates are a stated goal of lawgivers and political theorists at least until the 4th century BC.

The earliest Greek writer to deal specifically with these questions is Hesiod. At the very end of the 8th century BC he composed *Works and Days*, a didactic poem addressed to his

brother Perses. Hesiod covers a wide variety of subjects as he lectures Perses, but his central complaint involves land ownership: his brother has snatched most of their joint inheritance with the connivance of "bribe-eating lords", in spite of their private, apparently more equitable, agreement. In view of this, and his advice later in the poem to have only one son (in order that the family's wealth should grow), it is clear that in Boeotia of Hesiod's day it was the practice for all sons to inherit a part of their fathers' land. He also makes it clear that land could be alienated when he promises that, if Perses follows his advice, he will be able to buy the land of other people, instead of seeing his own land bought up by others. Finally, the complaints against the corrupt officials indicate that by the 8th century such disputes could be taken to an authority outside the family.

Evidence for Archaic and Classical Greece is far more abundant, but often confusing and contradictory. Both the 7th and 6th centuries BC and the 4th to the 2nd centuries BC were eras of widespread civil strife in many poleis, where conflict centred around disparities in wealth. Therefore, later writers tend to reconstruct earlier conflicts in terms of contemporary conditions. In the case of early 6th-century Athens, for example, Solon was appointed archon to deal with the crisis of debt bondage. Although this much is certain, the genesis of the crisis, its exact nature, and the content of Solon's legislation remain the subject of considerable dispute. Solon's own words about his aims and how he viewed his accomplishments in his legislative programme have survived, but as poems, not official documents. Adding to the confusion are various 4th-century sources which tried to coopt Solon's legacy in support of their own oligarchic or democratic philosophies. Any modern attempt to reconstruct the situation which Solon faced and how he dealt with it must take into account his own statement that, while he did cancel debts, he did not redistribute land, though some apparently expected him to do so. Current opinion holds that the land which the poor worked as share-croppers was either their own land which they had been forced to mortgage (Burford, 1993, p. 51) or public land which had been commandeered by the wealthy (Rihll, 1991, pp. 123–24). Solon in effect gave this public land back to the community, allowing the cultivators to become the owners. He is also credited by ancient writers with making it illegal to alienate one's inherited plot. The alienability of land in Classical Athens continues to be a controversial topic among scholars. On the one hand, there are specific cases of land being sold by at least the late 5th century, and on the other hand, there was obviously great social pressure against sales of this kind. The law of Athens went to great lengths at times to ensure that land would stay in the family, as is attested by the rules concerning the marriage of an *epikleros*, an heiress. When a man died leaving behind a daughter, but no son, this daughter was to be married to her nearest male relative. Ideally, she would bear two sons; one of whom would inherit from his father, and one from his maternal grandfather. This would also reconcile two conflicting desiderata: to give each son an inheritance and to keep the family holding undivided.

Other poleis had other strategies for preserving a rough equality among the citizens, ensuring each family a minimum livelihood. The Spartans called themselves *homoioi* ("equals"). Each male Spartiate was entitled to a portion of land which was worked by helots, and from this he contributed to the communal mess. Inability to make this contribution resulted in the loss of citizen rights. Again, Spartans were theoretically unable to alienate their ancestral plots. But by the 4th century BC the number of Spartans who were financially eligible to serve as hoplites had fallen disastrously. Wealth had accumulated in the hands of a relatively small portion of the population due to the transfer of property through dowry and inheritance by women: the wealthy were able to absorb more and more of the community's land through advantageous marriages.

The situation which allowed the Greeks to approach most nearly the ideal of equality among the citizens was the founding of a new colony. Beginning in the 8th century BC and continuing into the 5th century poleis would often solve their demographic problems by sending a portion of their citizens out to non-Greek territories to found a new city. Prospective settlers went on the understanding that the territory of the new polis would be allocated on an equitable basis. This did not mean that everyone would get exactly the same amount of land, but that, with no preexisting claims to the territory, and taking into account the variable quality of the lots, each would get a reasonable portion of the total land resources. When the division was done, the colonists would often swear an oath to abide by the distribution, and there might be actual legal penalties brought against anyone who in the future sought to have land redistributed.

In the 4th century the orator Isocrates described Greece as a land rent with civil strife and filled with destitute fugitives who posed a continuing threat to social order. His proposed solution, eventually made a reality by Alexander the Great, was a war of conquest against the barbarians, which would provide new lands on which to settle this horde. Whether or not conditions were quite so desperate in reality as in the speeches of Isocrates, it is certain that many Greeks left their homeland to settle in Egypt and the Near East as a result of Alexander's conquests. Those who went as soldiers were often rewarded for their services with grants of land. Since these grants were generally conditional upon continued military service, they frequently found it more profitable to lease the land to native cultivators. Furthermore, while the Greek poleis had avoided imposing direct taxes on land, seeing it as a sign of tyranny, those who received their plots from the Hellenistic kings usually found that they came with a whole host of taxes in kind and in cash. Individuals or colonies might be granted immunity from these taxes, but even this immunity served to underscore the fact that all the land was ultimately the possession of the king and not of the citizen body.

In the Greek homeland this emigration did not lead to a more stable situation with regard to agricultural conditions. Instead, there was a continuing tendency for the few to accumulate larger properties, or a larger number of scattered properties, which would be leased to the increasing numbers of those without land or without enough land to live on. In recent years archaeological surface surveys have confirmed, independent of literary testimony, that the number of rural sites decreases from the beginning of the 2nd century BC, particularly at the time of the Roman conquest of Greece. These sites are generally associated with small independent proprietors. Sites that continue to appear in the archaeological record tend

to be larger and show signs of affluence. On the basis of this evidence it has been suggested that the rural landscape came increasingly under the control of a few wealthy landlords. Their large estates would have been devoted to the production of cash crops and worked with large numbers of slaves. Alternatively, income could have been produced by leasing out plots to produce rents (Alcock, 1993, p. 72).

The late Roman landscape of Greece, however, shows a significant increase in the number of rural sites and there is a general sense of modest prosperity in the countryside. This is not really surprising, given that the peasants of the eastern Roman empire were not nearly as vulnerable to the pressures of large landowners as those in the western provinces, where the medieval institution of serfdom was already evolving. In the 4th and 5th centuries AD village communities of Asia Minor, Syria, and Egypt were still benefiting from the Hellenistic legacy of widespread urbanism. With towns and cities in which to market their products the peasants were able to pay their rents and taxes and maintain at least a measure of independence. This is not to say that conditions were not felt to be oppressive. Taxes were collected on both the land and its cultivators, peasants were always subject to extra assessments of produce and to demands for corvée labour. They had neither unrestricted freedom of movement nor an unlimited right to alienate their land. Reactions to these oppressive conditions often took the form of brigandage (Haldon, 1990, pp. 31–32), a phenomenon which also characterized the late Ottoman period.

The chaotic conditions of the 7th century AD may have led to a lessening of central control and a growth in the number of villages composed of small holders whose only responsibilities were the taxes which they paid directly to the Byzantine state. A tantalizing text called *The Farmer's Law*, which may date back to the 7th or even 6th century AD, paints a picture of a countryside dominated by this type of settlement. But the history of land tenure under the Byzantine empire is one increasingly dominated by peasants dependent on private landlords, the Church, or the state itself. In the 10th century the Byzantine state proclaimed itself the ultimate owner of all the lands of the empire. In effect, all private property was at risk from imperial confiscation (Kazhdan and Wharton, 1985, p. 17). An increase in the proportion of dependent peasants is also seen at this time. By the 13th century virtually all the peasants are referred to as *paroikoi* ("tenants"). *Paroikoi* had definite legal rights in that they could dispose of their property either by bequest or by sale. However, they were dependent in that they paid state taxes and rent to their landlord, owed him labour, and were not allowed to leave his service (Laiou-Thomadakis, 1977, pp. 144–45).

With the Ottoman conquest the lands of the Byzantine empire came under a regime whose ideology with regard to property was fundamentally different from that found in Romano-Byzantine law. Under a strict interpretation of Muslim holy law, private land ownership was not permitted. The sultan functioned as the custodian of the land on behalf of its true proprietor, God. In practice, individuals enjoyed the use and possession of land under various conditions – ranging from a form of feudalism to true private ownership. Ottoman law tended to identify cottage sites, their gardens, orchards, and vineyards as private property, while unimproved arable was retained as state land. Many aspects of Ottoman land tenure tended to undermine the ability of the actual cultivator to gain even a subsistence return from the land, but the fundamental source of corruption was the practice of granting individuals the right to take profits from land while having no responsibility for its cultivation (McGrew, 1985, pp. 21–31).

When Greece won its independence, the new government found itself the proprietor of a vast amount of land, and very few other sources of wealth. Initial attempts to redistribute land through public auction failed because the government was attempting to use the sales to raise money as well as put the land back into productive use. The Greek population, impoverished, suspicious of all governing authority, and well aware that much of the land would need a significant input of labour in order to provide a return, refused to participate. It was only some 40 years later, in 1871, that a plan was developed which met some success. This was principally because it was largely an offer to squatters to legitimize their holdings, provided they accepted a mortgage in favour of the state (McGrew, 1985, pp. 207–14).

In some ways modern Greek patterns of landholding tend to resemble those of antiquity. The countryside is typified by nuclear villages from which farmers go out to work their fields. Families tend to own only a small amount of land, with 6 hectares making for a large farm. One of the most striking features, to outsiders, of Greek patterns of landholding is how highly fragmented they tend to be. A farmer may spend hours travelling between parcels. There is no pragmatic reason for this fragmentation, since given the chance farmers will attempt through sale and trade to consolidate their holdings near their home village. Dowry and inheritance rules have been seen as the root cause of this phenomenon, and in at least one important respect they are different from those which prevailed in the ancient world. As in ancient Athens, all sons must inherit and daughters must receive a dowry. This does not necessarily have to be land, but traditionally it has been a component of both. Even sons who have left the land are frequently awarded a token piece of property "so they will not forget their father". One important difference however, is that the strict rules against marrying close kin which are enforced by the Orthodox Church all but ensure that young people will marry outside their own village. Combined with a strong tradition of patrilocal residence after marriage this inevitably leads to a family's holdings being scattered in several locations (Friedl, 1962, pp. 48–68).

Landscape

The great beauty and diversity of the Greek landscape were seldom fully appreciated by ancient Greeks, to whom these wonders were commonplace, or by modern tourists, who miss the glamorous parts. The best description of what the ancient Greek landscape looked like is the vision of the 12 mountains of Arcadia in the early Christian prophecy of Hermas, an Arcadian shepherd.

Greek landscapes are dominated by tectonics. Greece lies near the junction of two of the world's great tectonic plates, where Africa is burrowing under Europe. Over millions of years the forces of collision have generated the dramatic mountain landscapes of Greece, with their cliffs, gorges, and fault-scarps, especially around the gulf of Corinth and in Crete. Secondary effects include erosion and deposition, and the re-erosion of materials deposited during earlier periods of mountain building. Erosion has created the surrealistic gullied badlands of Macedonia and the northern Peloponnese, and the corresponding deposition has created many of the cultivable soils of Greece. Mountain building is, of course, still continuing today. At least three volcanoes – Santorini, Methana, and Nisyros – have erupted in historic times.

Most of modern Greece is rocky, with cultivation limited to plains or to places where soil has washed off the hillsides and accumulated in basins. Areas of land for cultivation were extended by the construction of terraces, bands of soil held up by retaining walls. Terraces created a level surface, got rid of boulders by building them into walls, accumulated and held soil, broke up the bedrock so that roots (especially of vines) could penetrate it, and increased absorption of water in times of heavy rain.

Wild vegetation in Greece ranges from forest to desert, depending mainly on rainfall and how much moisture is stored in the soil and bedrock (see the article on Climate). Forests occur mainly in mountains, especially in western Greece; often they occur on fissured limestone with no soil. In drier or more heavily used terrain forest gives way to maquis, land dominated by shrubs, most of which are in fact trees stunted into a shrubby form by browsing, burning, or woodcutting. Alternatively trees may form part of savanna, where large trees grow scattered in grassland or heath. Where moisture is more limited, the vegetation consists of *phrygano* ("scrub"), dominated by heathlike, spiny, or aromatic undershrubs which are not potential trees. Steppe is herbaceous vegetation with grasses, bulbous and tuberous plants. Patches of maquis, *phrygano*, and steppe typically occur intermingled, rather than in separate areas.

In Ancient, Byzantine, and Early Modern Greece wild vegetation was not underused land. It provided pasturage, fuel, materials for crafts, honey, edible plants, and medicinal herbs. The plants, except for those limited to cliffs, have the ability to resist, or recover from, browsing, burning, and woodcutting.

In pre-Neolithic times Greece was more wooded than it is now; in the drier east the trees probably formed savanna. There is some evidence for steppe, but *phrygano* was probably limited to particular, mainly coastal, areas. Crete and other islands may have differed from the mainland, owing to their peculiar faunas (nearly all extinct by the Bronze Age), including tiny elephants and mini-hippopotamuses. Lacking predators, these animals would have flourished sufficiently to bring about an ecological condition that would today be regarded as excessive browsing.

During the Neolithic and the Bronze Age the Greek landscape was affected both by increasing human activity and by the advent of a drier climate. Forests on good soils were uprooted to create farmland; on the remaining land native animals were replaced by domesticated – goats, sheep, and cattle. Forests retreated to places with moisture or good root penetration, being replaced by maquis or savanna. Undershrubs profited from the changes to establish areas of *phrygano*. The date, nature, and consequences of deforestation are controversial, but there is no firm evidence that Greece in Classical times was more wooded than it is today.

By Classical times ecological changes were largely completed. The landscape looked not very different from Greece today, aside from urbanization, road making, and bulldozing. An important difference is the disappearance of fens, most of which were destroyed in the 19th century. Classical Greece had much more grain and legume cultivation than today, and much less olive-growing; they kept cattle and pigs, as well as sheep and goats. At least half the land was natural vegetation (forest, savanna, maquis, *phrygano*, steppe, and fen). There was already the infrastructure of a cultural landscape in the form of roads, field walls, pollarded trees, and some terraces. Terracing, begun in the Bronze Age, was proba-

bly more limited than in Early Modern times; no ancient author definitely mentions it.

The coast of Greece has also changed. After the last ice age the world's sea level rose some 100 m to about its present level. This created bays, which have since become river deltas or have been filled with material eroded from the hills. At the same time the land has been jerked up or down by tectonic movements. A famous example of coastal changes in historic times is at Thermopylae, where the site of the ancient sea-cliff battles is now well inland and deeply buried.

Ancient city states varied hugely in the territory and resources that they controlled. Athens and Sparta were giants, with access to all ecological zones, from mountains to the sea. But even Athens was not self-sufficient in timber and not always so in grain. Some of the smallest cities had recourse to only one or two ecological zones, like the three states on the barren mountain isle of Amorgos, or the city of Tarrha at the mouth of the gorge of Samaria in Crete, which apparently had no ecological resources at all except cypress timber.

In antiquity Greece was not, as today, a land of cities and large villages set in otherwise uninhabited countryside. Instead there were small towns, small villages, hamlets, and single farms, grading into field houses that were inhabited only seasonally. Such a dispersed pattern of settlement still survives in western Crete, the Mani, and the island of Cythera; elsewhere, especially in the Middle Ages and the 16th century, houses have clustered into villages.

The use of the land would also have fluctuated over the centuries, as the human population rose and fell and as opportunities for trade changed. At times of prosperity, cultivation and pasturage would have increased so that the land would have been fully used or overused. In leaner times trees and other vegetation would have been left to invade fields and pastures.

Good and bad land have not always been the same as now. Some rugged, water-retaining, fertile mountain areas, such as northern Parnon, have a history of dense population. Some apparently promising plains, as at Nemea, have had periods of use only as pasture. Undrained fens, now despised, were precious as summer pasture for cattle. Coastal plains, though offering good land, and small islands have not always been favoured for cultivation or settlement because of the danger of raids by pirates.

The 19th century was a time of unusual population growth, leading to an exceptionally high rural population in the 20th century. New settlements were founded, especially on previously uninhabited coastal plains and in drained marshes. Around existing settlements terraces were extended to the limits of cultivable soil. American plants became important crops. Crete, especially, had an overcrowded appearance: most wild trees, even on cliffs, bear the marks of having been cut down for wood many times.

After 1950 rural populations declined, as people migrated to cities and coastal towns or to overseas colonies. The remaining rural life has become more specialized. Cultivation has retreated from terraces on to level ground where tractors can be used. Olive growing, market gardening, greenhouses, and irrigated orchards have greatly increased; cereals have disappeared from many areas. Cattle, horses, and donkeys are relatively rare. Woodcutting has almost disappeared, partly because of the advent of fossil fuels, but also because pruning olive and fruit trees produces firewood without the labour of felling trees. In many mountain villages the economy has been reduced to olives, goats, and sheep, sometimes not even these. This is not because traditional land-uses have proved unsustainable, but because tourism, bureaucracy, industry, and commerce have created easier ways of making a living.

This has resulted in extensive areas of abandoned terraces, and often also of abandoned pasture. Natural vegetation has greatly increased. Substantial forests have replaced terraces or savanna. Often these are of pines, which are extremely susceptible to, but have a natural ability to survive, fire. Where cultivation persists it has been intensified, bulldozers often being used to dig new fields out of hillsides. Further havoc is wrought by works to provide water for irrigation. What was once a complex, stable landscape has been reduced to large tracts of uniform vegetation, periodically burnt in conflagrations, and liable to erosion wherever the bulldozer has been deployed.

Language

The term "Greek" refers to the language spoken by the Indo-European inhabitants of Greece from their first arrival in that land to the present day. Greece was already populated when they arrived (probably not long after 2000 BC), but the original inhabitants spoke another language of which little trace remains; since there is no consensus even as to which language family it belonged, it is simply referred to as "pre-Greek". Greek itself belongs to the Indo-European family of languages and is thus related not only to Latin (and hence French, Spanish, and all the other Romance languages), but also to Sanskrit (and hence Hindi, Bengali, etc.), Hittite, Armenian, Albanian, Tocharian, Persian (and Kurdish, Afghan, etc.), the

Celtic languages (Irish, Welsh, etc.), the Germanic languages (English, German, etc.), the Baltic languages (Lithuanian, etc.), and the Slavic languages (Russian, Bulgarian, etc.). Since all languages change over time, however, these relationships were much closer in ancient times than they are today.

The original Proto-Indo-European language from which Greek and all of these other languages evolved was highly inflected; it had eight cases for nouns and divided number not into singular and plural but into singular, dual (used for two objects or people), and plural (used for three or more). It also had a number of sounds that have since disappeared from many of its descendants, such as vocalic (vowel-like) forms of L, R, M, and N, aspirated consonants such as DH, BH, and GH, and mysterious "laryngeal consonants", the exact pronunciation of which remains uncertain. On the other hand the parent language lacked many sounds with which we are familiar, such as F, V, J, CH, Z, and TH.

Greek is one of the oldest attested Indo-European languages; its earliest known form is Mycenaean, the language of the Linear B tablets. Since these tablets date from the 13th century BC or earlier, the history of Greek can now be traced over a period of 33 centuries. Because Linear B was written in a syllabary that did not indicate all the sounds of a word, however, and because it was used for writing lists rather than literature, much remains unknown about Mycenaean Greek. Nevertheless, we can see that it had already evolved to be recognizably Greek rather than Proto-Indo-European. The dual and some consonants that Greek would later lose (Q, W, Y, H) were retained, but the old case system was somewhat simplified and a number of consonants and vowels had disappeared. Mycenaean Greek, as we have it, does not appear to be divided into dialects; tablets from Thebes, Pylos, and Crete show only minor variations in language. Nevertheless it is likely that speakers of other Greek dialects were present somewhere in Greece during the Mycenaean period: not all classical Greek dialects can be descended from Mycenaean, but all show evidence of contact with the pre-Greek population and thus of having existed in Greece for a similar length of time.

The Mycenaean period ended around 1200 BC and was followed by a time known as the Dark Ages, when writing was unknown throughout most of Greece. (A relative of the Linear B script seems, however, to have survived in Cyprus, where it later reemerged as the Cypriot syllabary.) There is thus a gap during which one cannot trace the evolution of the Greek language; after the Mycenaean period, it next appears with our earliest evidence of the Greek alphabet, in the 8th century BC. By this time the number of cases had been reduced to five, the dual was in the process of disappearing, Q and Y had been entirely lost, and W was on its way out. Moreover, the Greek language was divided into a vast number of local dialects. Of these, only those spoken in Arcadia and in Cyprus appear to be direct descendants of the Mycenaean dialect; the other dialect groups, including Attic (the dialect of Athens), Ionic (the dialects of Greeks in Asia Minor), Aeolic (the dialects of the Lesbians, Thessalians, and Boeotians), and Doric (the dialects of Crete and most of the Peloponnese) seem to be descended from something slightly different. All the dialects, however, are clearly part of the same language and were mutually comprehensible.

The language normally described by the term "Classical Greek" is Attic, the dialect of Athens in the 5th century BC. At the beginning of the 5th century BC this dialect had no special status, but Athens' rise to political prominence during the Persian Wars and the extraordinary quantity of first-class literature produced by Athenians in the 5th and 4th centuries BC rapidly made Attic the most important Greek dialect. This is not to say that all ancient Greek literature was written in Attic; far from it. The earliest surviving literature, the Homeric poems, is written in a mixed dialect based on Ionic and containing almost no trace of Attic, and the poets who first followed Homer used a variety of dialects, none of them Attic. The Attic dialect first came into prominence with the development of tragedy, which was a distinctively Athenian genre. Even tragedies, however, were not simply written in the native dialects of their authors. The dialogue portions were composed in an artificial and elevated literary Attic with many features from other dialects, while the sections sung by the chorus were written in what was nominally Doric, though in some ways it would be more accurate to describe it as a Doricized Attic.

Comedy, however, made much more use of ordinary Attic, as did many prose genres. A peculiarity of Greek literature of the Archaic and Classical periods was that literary genre rather than the author's origin normally determined the dialect used. Thus although two of the greatest early Greek poets, Hesiod and Pindar, both came from Boeotia and would naturally have spoken an Aeolic dialect, Hesiod wrote in the Ionic-based epic dialect and Pindar wrote in Doric, because these were the dialects appropriate to their chosen genres (respectively epic poetry and choral lyric). Tragic choruses had to be composed in Doric because of the tradition of Doric choral song out of which the tragic genre evolved. Scientific and historical prose was originally written in Ionic, but as time went on Athenian prose authors began to write in an Ionicized version of their own dialect. Many of these literary dialects, however, were rather different from the same dialects as used for non-literary purposes by native speakers and attested in local inscriptions; they contained features of other dialects and were usually meant to be separated from and elevated above the usages of ordinary speech.

In the 4th century BC the political power of Greece was gradually eclipsed by that of its northern neighbour Macedonia. The issue of whether the Macedonians could be considered Greeks was debated in ancient times much as it is today. Little remains of their original language (which is unconnected to the modern Slavic language known as "Macedonian"), and from that little it is possible to argue either that Macedonian was a bizarre Greek dialect or that it was a different but related language. The Greeks themselves seem not to have understood it as easily as they understood each other's Greek dialects. Culturally, however, it seems that the Greeks looked down on the Macedonians as uncivilized barbarians, and the Macedonian monarchs reacted to their own feelings of inferiority by a programme of linguistic and cultural Hellenization. Greek was adopted as the official language of the Macedonian court, where from the time of Philip II Greek literature and education were highly valued. Because of the political and literary importance of Athens, the form of Greek adopted by the Macedonians was an Ionicized Attic.

The Macedonians soon became far more powerful than the Greeks from a political point of view, but even after conquering Greece they retained their respect for its language and culture. The conquests of Alexander the Great in the late 4th century BC thus had the effect of spreading the use of the Greek language and the appreciation of Greek literature and culture over a huge section of the ancient world. In the Hellenistic kingdoms that resulted from Alexander's conquests, Greek became the language not only of the court, but also of business, administration, and most upper-class interaction. Education normally consisted of training in the Greek language and literature, and knowledge of Greek was required for entry into the civil service and the army. Greek rapidly became the mother tongue of the elite as well as being widely spoken as a second language by much of the population. The less educated lower classes went on speaking their own languages most of the time, but these languages were less likely to be used in written communication.

The Greek used in the Hellenistic kingdoms was based on the Ionicized Attic adopted by the Macedonians, but it was sufficiently distinct from the dialect of Athens that it acquired a new name, the *koine* or "common dialect". The Koine was in some senses a uniform dialect; the differences between Koine documents from different parts of the Hellenistic world are minimal compared to, say, the differences between Attic and Doric. In other respects, however, it was far from uniform; there was some local variation, and a good deal more variation based on the level of education of the writer and his intended audience. The most highly educated Hellenistic scholars, however, could and did produce not only Koine but also the various literary dialects of the earlier periods.

In Greece itself the loss of the individual city states' political autonomy in the Hellenistic period led to the decline of the local dialects. Although most of the ancient dialects survived into the Roman period as spoken languages, the use of Koine came to be seen as a mark of education, in Greece as in the rest of the Hellenistic world. The result was that Koine supplanted the local dialects as the language of the elite and gradually became the official written language of cities that had once proudly displayed their own dialects in inscriptions.

Eventually Greece and the various states that had been part of Alexander's empire fell under Roman rule. This meant the introduction of Latin into Greece, but since the Romans had no cultural heritage to compare with that of Greece, the status of their language suffered greatly. The use of Latin never became widespread in Greece, but Greek grew more and more popular in educated circles in Rome. Meanwhile, in the other states that had been part of Alexander's empire, a tripartite linguistic situation arose: Latin became the language of some administrative and military circles, but Greek remained the language of education and culture, while much of the native population went on speaking the language that they had spoken before Alexander's arrival. The most important and prestigious of these three languages was normally Greek; in Egypt, for example, where large quantities of public and private documents have been preserved on papyrus fragments buried in sand, it is clear that most writing was done in Greek. In fact, the eastern half of the Mediterranean in the Roman period was often called the "Greek east". The degree to which Greek actually replaced local languages, however, depended on the region; in Egypt, despite the vast numbers of Greek papyri, most of the peasants spoke Coptic, but in Asia Minor the native languages tended to die out completely during the Roman period.

The dialect of Greek involved, of course, was still the Koine, but after centuries of evolution and of being used as a second language it showed some significant differences from the Ionicized Attic with which it had begun. These differences are perhaps greatest in phonology, for the pronunciation of Greek changed dramatically during the Hellenistic and Roman periods. At the time when the Greeks began to use the alphabet (the 8th century BC), their language contained ten simple vowels (A, E, I, O, U, each of which had separate long and short forms) and a wide variety of diphthongs (AI, EI, OI, UI, AU, EU, and OU, many of which could have either a long or a short vowel as their first element). By the Classical period, however, the short diphthongs EI and OU had already been monophthongized, and shortly afterward those diphthongs that consisted of a long vowel followed by I lost the I. (As a result, this I was not normally written in ancient documents, but it now appears in Classical texts as the iota subscript.) Then the short diphthong AI merged with short E, UI and short OI both merged with U, and the already monophthongized short EI merged with I. Eventually the distinction between long and short vowels was lost altogether.

The consonants phi, theta, and chi, which had originally been aspirated stops (P followed by H for phi, T followed by H for theta, K followed by H for chi), turned into the fricatives F, TH (as in English "thing"), and CH (as in German "ich", not English "change"), while in most contexts the voiced stops B, D, and G became the voiced fricatives V, TH (as in English "the"), and the voiced equivalent of CH (which does not exist in English). In the Classical period Greek did not have a stress accent as in English, where one syllable of each word is perceived as pronounced more emphatically than the others, but rather a pitch accent as in modern Norwegian, where an accented vowel is perceived as pronounced on a higher pitch (one Greek grammarian speaks of the voice being raised by a musical fifth). In Koine, however, the Greek pitch accent changed to the stress accent that is still used in Modern Greek.

It is sometimes difficult to pinpoint the date of these changes in pronunciation, not only because they occurred gradually and probably took effect in some regions before others, but also because the Classical spelling remained in use for most written documentation. Spelling mistakes, however, are very useful in tracing linguistic evolution: when papyri regularly show AI for E and E for AI, this is evidence that the two were pronounced the same, and the date when this mistake becomes common (the 2nd century BC) can be taken as one by which the change was complete, at least in Egypt. Borrowings into and from other languages also give us clues: when the Romans first began to borrow Greek words containing the letter phi, they represented it with PH, showing that the sound in question was an aspirated P. But later on the sound of phi changed to F, and at that point (the 1st century AD) the Romans used F to represent it.

The complex grammar and syntax of Classical Attic were also simplified in Koine. Two past tenses, the perfect ("I have done") and aorist ("I did") became interchangeable so that either could be used in either sense; eventually the perfect died

out and only the aorist was used. The optative, a verbal mood used to express wishes and potentiality and which replaced the subjunctive after verbs in a past tense, disappeared from Koine almost entirely. The middle voice, which in Classical Greek was distinct from both the active and the passive in meaning, if not always in form, was also lost. At the same time many irregularities of declension and conjugation were eliminated; thus, for example, the verbs that had originally ended in -MI began to lose their distinctive conjugation, although this change was completed only in the Byzantine period. During the Roman period many words of Latin origin also found their way into Greek.

The changes in grammar, syntax, and vocabulary were more often reflected in writing than those in pronunciation, but they too could be avoided by more educated authors. The New Testament, for example, is a document of the early Roman period written in a fairly basic form of Koine; it displays a grammar and syntax that are much simpler than those of Classical Attic. But it is not a uniform text written by a single author, and in some portions, for example the Gospel of Luke, even the optative appears. Other writers of the early Roman period, such as Polybius and Plutarch, wrote in a very different type of Koine far closer to Classical Attic. Since Greek education stressed the reading and memorization of Classical texts, there was a certain status attached to an ability to write Greek in a manner closer to that of those texts. Writers with a good education normally came from a fairly high-status background and naturally wanted their works to show this education and background, although if they were writing for a popular audience they might simplify their language in the interests of comprehensibility. People with little education did not normally become writers – the New Testament is something of an exception in this regard – but they often composed private letters which have survived on papyrus and tell us much about the evolution of non-literary Koine.

One of the most significant linguistic events of the Roman period was the revival of literary Attic in the 2nd century AD. Whereas earlier well-educated writers had been able to win respect using a form of Koine relatively close to Attic, it was now necessary for them to use "pure" Attic, a language as close as possible to that of Plato and the Classical orators. In the 2nd century AD Attic came to be seen as "Greek"; everything else was simply evidence of lack of education. The great writers of the period, such as Lucian, managed to achieve Atticism to a remarkable degree. Purity of language was required not only in writing but also in speech, and the opprobrium heaped on men of letters who accidentally delivered themselves of a non-Attic word or phrase is well documented. This does not of course mean that everyone in the Greek-speaking world began to speak Attic in the 2nd century; far from it. But everyone with literary pretensions tried. The reason for this revival seems to have been a desire for closer association with the glorious Greek past, since continuity of culture, the one thing that the Greeks had in a world dominated by the Romans, appeared to be assured by linguistic closeness to the past.

After the 2nd century AD the extremes of the Atticizing movement were modified, but the achievements of the period had a lasting effect on literary Greek; Attic always remained as an ideal, even if fewer writers pursued it. Written Greek came to consist of a range of styles combining Attic and Koine; at the top end of the spectrum were compositions in almost pure Attic, but these were the exception rather than the rule, and most writing showed some or many Koine features. Virtually all writing, however, was conducted in a language distinct from that used in normal speech. Learning to write involved learning the use of written Greek, rather than learning how to transcribe one's own speech. This situation is not so different from that which exists today for English, where learning to write involves learning the difference between "too" and "to", and at a higher level between "its" and "it's".

Starting in the 3rd century AD military imperatives forced a gradual administrative division of the Roman empire into eastern and western halves, with a resulting decline in linguistic interaction. In the 4th century the capital of the empire was moved from Rome to Byzantium (refounded as Constantinople), a move that bolstered the status of Greek as an imperial language and led in time to its official recognition as such. The use of Greek in the West and that of Latin in the East was sharply reduced, particularly after the early 5th-century collapse of the western Roman empire. The eventual result was a government in Constantinople that used Greek and ruled a largely Greek-speaking (whether as first or second language) populace, but which still regarded itself as being the Roman empire. From this situation arose the use of the term Romaic ("Roman") as a name for the Greek language; this term remained in use as late as the 19th century as a means of referring to spoken, as distinct from written, Greek. Even today, some Greeks use *Romios* to mean "a Greek person".

The Middle Ages in Greece are known as the Byzantine period; they begin in the 4th or 5th century AD and end with the capture of Greece by the Turks in the 15th century. During this period the language continued to change, although in many cases the changes were merely completions of processes that had begun much earlier. In pronunciation, long E merged with I, as did U; this meant that original long E, EI, I, U, UI, and OI now all had the same pronunciation (like the "ee" in "queen"). The U in the diphthongs AU and EU came to be pronounced as F or V (depending on the letter following). The sound H, which had been losing ground since the Hellenistic period, was lost altogether. Unstressed initial vowels were generally lost, meaning that verbal augments often disappeared. Nouns of the first and third declensions converged and became more and more similar, and there was a further suppression of irregular paradigms. Many pronouns were replaced; among the most striking such replacements is that of the relative pronoun, which in classical Greek had been fully inflected for gender, number, and case, and which in the Byzantine period was replaced by an uninflected word originally meaning "where" (*pou* or *hopou*). The dative case, which had also been gradually eroded, disappeared from colloquial usage. The wide variety of prepositions used in classical Greek was greatly reduced. The use of the infinitive declined dramatically, as did that of the participle, and the old future tense began to be replaced by a periphrasis formed with the verb "want" (*thelo hina*); later this periphrasis would be simplified into the uninflected particle *tha* used to form the future in Modern Greek. Following the loss of the perfect tense, a new periphrastic pluperfect was formed using the past tense of the

verb "have"; later a new perfect would also be formed on this model.

This period also marks the beginning of a famous linguistic phenomenon known as the "Balkan *Sprachbund*", in which languages that are fundamentally distinct (Greek, Albanian, Romanian, Serbian, and Bulgarian) have certain grammatical features in common as a result of the prolonged interaction of their populations. These features include the replacement of infinitive phrases with subjunctive clauses and the formation of the future with a particle derived from the verb "want".

Spoken Greek of the Byzantine period is called the vernacular, rather than Koine; the Koine of the Roman period remained in use as a literary language, but, as we have seen, the uneducated spoken language became more and more distant from it. Literary Greek still had many different levels: there was a high register which at its purest was not greatly different from Classical Attic, though generally more ornate, and below this register came a variety of less and less Atticizing ones, which generally carried less prestige the less archaizing they were. "Atticizing", however, did not refer to an exclusive use of Classical models as it had in the 2nd century AD; the Byzantines saw writers of the Roman period, and even later, as equally suitable for imitation. The tradition of writing "good" Greek was seen as a continuous one, and what counted was a writer's style, not his date. A number of Byzantine scholars were extremely well educated in Classical literature and could write in a variety of different forms of Greek; they used highly Atticized language or more basic Koine depending on their intended audience. Some earlier literature was rewritten to conform to the linguistic demands of its new audience; in some cases this meant recasting in a less archaizing style, but in other cases works were rewritten in higher rather than lower registers.

There was a tradition of oral poetry during the Byzantine period, and in the 14th and 15th centuries a number of written poems appeared that seem to derive from this tradition; at the same time romances, chronicles of recent history, and some other types of popular literature started to be written in a language closer to the vernacular than that of most Byzantine writing. It is likely, however, that the language of these works is still somewhat archaizing compared to that in use in uneducated speech. The rise of this vernacular literature is probably related to the fact that from the 13th century much of the Byzantine world was ruled by western Europeans, particularly French and Italians. The Byzantine state with its centralized bureaucracy, education system, and Church had exerted a standardizing and unifying influence on the written language, and much of that influence was lost with the decline of the central authority.

Other linguistic developments in the late Byzantine period have the same cause. Many French and Italian words entered the Greek language as a result of contact with the new rulers, and a new system of dialects became apparent. These dialects had grown up gradually over the centuries (they are not descendants of the Classical dialects, but of Hellenistic Koine), but the centralization of the empire had prevented their developing radical differences or breaking up the language in the way that Latin was dissolved into the Romance languages during the same period.

After the Turkish conquest in the 15th century, literary production and the general level of education both fell dramatically. The bastion of learning that remained in Greece proper was the Church, and thus the Greek used by the Church became the written standard of the period. This was not the vernacular, but a form of Koine that could be more or less Atticizing as necessary, as the language of the Byzantine court had been. Despite this restoration of a form of central control, the language did not remain unchanged by Turkish occupation, for many Turkish words were absorbed into Greek. A large number of these have since been expunged by patriotic reforms, but some still remain. The local dialects became rapidly more distinct from one another, as communication and mobility within the Greek world were reduced.

In the early 19th century Greece became independent from Turkey, and the modern Greek state was established. The existence of a state immediately led to what is known as the "Language Question": which of the innumerable spoken and written varieties of Greek would become the official language of the new country? Some advocated a return to Attic, others a written form of the vernacular, and many some form of compromise. It is important to note that the Language Question is a modern phenomenon; different forms of Greek had existed since ancient times, but previously they had coexisted fairly happily, and there had been a general consensus that different forms of language were appropriate to different linguistic situations.

In the end, a standard spoken language established itself. The dialect of the Peloponnese, which was more prosperous and had closer ties with the influential expatriate Greek community than the rest of Greece, was closer to Koine than many of the dialects of other regions. In addition, it was the dialect of the first part of Greece to be liberated from Turkey. This dialect began to be used more and more widely in the new Greek state, even ousting the Old Athenian dialect from the new capital at Athens. In the 20th century, with the advent of mass media and increased mobility, the Peloponnesian dialect has almost entirely replaced the others, resulting in the virtually complete standardization of spoken Greek.

The written standard posed a different sort of problem. Initially, official preference was given to what later came to be called *katharevousa*, a form of Greek based on the spoken language but extensively "cleansed" of modern features. Virtually all prose in the new state, literary and non-literary, used this medium, and most poetry composed in Greece did as well, though some expatriate poetry (which later became extremely influential) did not. The problem with *katharevousa* in the 19th century, however, was that any standard deciding how much cleansing should take place was artificial and easily perceived as such; this resulted in an escalating competition of archaization, with writers trying to outdo each other in their revival of long-vanished linguistic features. Meanwhile some of the proponents of what came to be called demotic, a language closer to the spoken standard, went to the other extreme and produced neologisms that did not actually exist in the spoken language. At the same time, however, literary figures were increasingly won over to demotic, and by the end of the 19th century it had become the language of most creative literature.

The linguistic debate became increasingly polarized and vicious, leading to riots at the beginning of the 20th century

when demotic translations of ancient works were produced. The issue was then politicized, with advocates of *katharevousa* being seen as politically conservative and supporters of demotic as left-wing. This politicization meant that in the 20th century there was some change in the language of school instruction virtually every time there was a change of government, as well as that the linguistic choices of individuals were constrained by politics. Eventually in 1974 a military government that had mandated *katharevousa* was ousted, and the enormous unpopularity of that government guaranteed that demotic would become and remain the official language. Today *katharevousa* is rarely used in Greece, although the fact that it was the official language until only a few decades ago means that most Greeks retain at least a passive knowledge of it. Demotic, however, has now absorbed many of the features of *katharevousa*, including some elements that had been lost for centuries from the spoken language, and is markedly distinct from the language advocated by early radicals. It is now known as Standard Modern Greek to acknowledge that fact.

Although the phonology of Standard Modern Greek is greatly different from that of the Classical language, the traditional spelling of most words has been retained. This can cause some confusion for learners; it means that the sound "ee" can be spelt E, I, EI, OI, or U, for example. On the other hand, the rough or smooth breathing indicating whether or not H used to be present on an initial vowel has been abolished, and it is no longer necessary to make the distinction (meaningful only with a pitch accent) among acute, grave, and circumflex accents. Modern texts of works in ancient Greek, however, do have both accents and breathings in addition to a fully ancient orthography.

Larissa

City in Thessaly

Larissa is located in the middle of the Thessalian plain on the right bank of the river Peneus. It is about 32 km from the sea, and bestrides the major north–south routes between Athens and Macedonia. Among the few remains of the early city are a late Hellenistic theatre excavated near the modern main square, a low hill to the south of the square marking the site of the ancient acropolis, and the remains of the Byzantine *phrourion* (fortress) to the east of the square.

The name Larissa is pre-Greek, and means "citadel". (Indeed, settlement on the site goes back to palaeolithic times, as is attested by archaeological remains.) According to Greek mythology, however, the city was founded by Acrisius, the father of Danae and the grandfather of Perseus, and was named after a nymph (whose likeness appears on coins of the 4th century BC). Unlike other places in the area, such as Phthia, Larissa is not named in the catalogue of ships in book 2 of the *Iliad*, or indeed in the rest of the *Iliad* or *Odyssey*, though some scholars have wanted to associate Larissa with the city Argyssa, which is mentioned in the catalogue of ships.

When Larissa first became important in Greek history, it was dominated by the powerful family of the Aleuadae. Their influence in Larissa, and, to a lesser extent, in Thessaly as whole, lasted from the early 6th to the end of the 4th century BC. The founder of the family was Aleuas, who claimed descent from Heracles. Although tradition more strongly associates Heracles with the rival (and related) Scopadae of nearby Crannon, the late 6th- and early 5th-century BC poet Simonides is cited by Theocritus (in *Idyll*, 16. 34–46) as praising Aleuas among other Thessalian grandees, such as the Scopadae and the Creondae, for his wealth: "Many slaves drew their monthly rations / in the palaces of Antiochos / and King Aleuas" (tr. Barriss Mills).

The Aleuadae were renowned as patrons of literature; writers of different generations and genres such as the poet Pindar, the Presocratic philosopher and rhetorician Gorgias, and the physician Hippocrates are all said to have spent time in Larissa as their guests. The fact that both Gorgias and Hippocrates are said to have died there may be a less than ringing endorsement of Aleuad hospitality.

Politically speaking, the legacy of the Aleuadae was more mixed. They were strongly associated with the political and military organization of Thessaly along federal lines. Thorax, the leader of the Aleuadae at the time, and his brothers sided with the Persians, during Xerxes' invasion of Greece in 480 BC, as did the neighbouring Macedonians. This realpolitik led to a loss of influence by the Aleuadae after the Greeks defeated Xerxes and drove his army out of Greece. Furthermore, by the end of the 5th century BC, a democratic revolt in Larissa and the rise of tyrants at Pherae had weakened the power of the Aleuadae. In the 4th century BC they made the fatal mistake of calling upon their fellow Heraclid, Philip II of Macedon, as an ally against the tyrant of Pherae. Philip annexed all of Thessaly and held it, despite an unsuccessful revolt of the Aleuadae in a belated attempt to undo their mistake. The Aleuadae faded from history thereafter.

Larissa was ceded to the Romans after the second battle of

Cynoscephalae in 197 BC, and became the capital of a new Thessalian confederation (which lasted until Diocletian's reorganization of the provinces at the start of the 4th century AD). Achilleius, the city's patron saint, was its first bishop, and attended the Council of Nicaea in 325. The city's fortunes were varied in late antiquity and under the Byzantine empire. It was attacked by such foes as the Ostrogoths, the Bulgarians (who carried off relics of St Achilleius in 985), the Normans, and Boniface of Montferrat of the Fourth Crusade. In the 8th and 9th centuries it served as the metropolis of Hellas, but in the 13th and 14th centuries it was ruled at different times by the Lombards, the despotate of Epirus, the Serbs, and the Byzantines, before passing under Turkish rule in 1393. During the Tourkokratia, which lasted for Larissa until 1881, it was eclipsed by Trikkala, from where the Turks ruled Thessaly, as had the Serbs before them, until 1870. A strong Turkish garrison kept Larissa from participating in the War of Independence, and some Turks continued to live there until the 1920s. The city suffered severe damage in 1941, when it was defended by a combined Graeco-British force against the invading Germans, and also suffered under German occupation. Today, it is the capital of the province of Thessaly, and the chief city of its nome. The Greek First Army has its headquarters in Larissa, and it is the seat of the Metropolitan Bishop of the Second Thessaly and Exarch of All Hellas.

Summary

Larissa, the chief city of Thessaly, lies on the right bank of the river Peneus in the middle of the Thessalian plain. In mythology founded by Acrisius and named after a nymph, the city was ruled by the Aleuadae in the Classical period. Having made an alliance with the invading Persians the city lost influence in the 5th century BC following their defeat. Under the Romans it was the capital of the Thessalian confederacy, but under the Turks it was eclipsed by Trikkala.

Laskaris family

Rulers of the empire of Nicaea (1204–1261)

The Laskaris family, or the Laskarids, ruled the Byzantine empire in exile in Nicaea (1204–61). Although the family name Laskaris is known from the middle of the 11th century, no prominent members of it are known to have entered the upper tier of the Byzantine aristocracy during the rule of the Komnenoi (1081–1185) and the Angeloi (1185–1204). The founder of the Nicaean empire was Theodore I Laskaris (1204–22). Having distinguished himself in battle in the Balkans, Laskaris had been awarded the title of despot and had married the daughter of the emperor Alexios III Angelos (1195–1203). After the Latin conquest of Constantinople on 12 April 1204 and the establishment of the Latin empire, he organized the resistance of the Greeks in western Asia Minor. One of Theodore Laskaris's five brothers, Constantine Laskaris, might have been the unknown Laskaris to whom an assembly in Hagia Sophia had offered the imperial crown the night before the Latin conquest, but afterwards he disappears from the sources as a holder of the imperial office.

In 1205 the people of Nicaea acclaimed Theodore I Laskaris as emperor of the *Romaioi* in the aftermath of the Latin defeat at the battle of Adrianople by the Bulgarians. In order to bolster his imperial claims, Theodore chose Michael IV Autoreianos (1208–14) as ecumenical patriarch in 1208. In the same year the newly appointed patriarch crowned and anointed Theodore I Laskaris as a divinely chosen emperor. Yet the legitimacy of the Laskarids was questioned by Alexios III Angelos, Theodore's father-in-law, who had found refuge at the Seljuk court in Konya. The Seljuks invaded Nicaea in the spring of 1211, but Theodore I Laskaris defeated them in a pitched battle in 1211 near Antioch-on-the-Menander, killed the Seljuk sultan Kay-Khusraw I (1195–97 and 1205–11), and captured Alexios III who was then imprisoned for the rest of his life in a monastery. The rulers of Epirus, the other important Greek successor state that had emerged after 1204, were also rivals of the Laskarids. The imperial claims of the Epirote ruler Theodore Komnenos Doukas (*c.*1215–30), crowned as emperor in Thessalonica in 1227, came to an end when the latter was captured by the Bulgarians in 1230.

The chief source of strength of the Laskarid dynasty was the conviction that the Nicaean empire was the Byzantine empire recreated in exile and that they were destined to restore Constantinople as the seat of rule. Theodore I Laskaris followed the Byzantine imperial model in the organization of court life and administration. In comparison with the Byzantine empire of the 11th and 12th centuries, however, the empire of Nicaea was better administered and a more vigorous state. The aristocracy enjoyed fewer privileges and tax immunities, while the small landholders could meet their obligations to the state fisc. The Laskarids protected local commerce and manufacturing, cloth production in particular. Only one commercial privilege, given to Venice in 1219, is known for the whole period of Laskarid rule. Administrative posts and other positions of power were systematically entrusted to people of low social origin and to members of the emperor's inner circle. The anti-aristocratic policy of the Laskarids culminated in the reign of the Theodore II Laskaris (1254–58). The powerful landed aristocracy felt excluded from power, abandoned the Laskarids, and supported the claims of Michael Palaiologos, first as regent (1258) of the young John IV Laskaris (1258–61), then as a coemperor (1259), and finally as a sole ruler (1261).

Imperial succession under the Laskarids was by and large hereditary. It is true, however, that they took pains to hand the

imperial office to an able successor. Theodore I Laskaris passed over his son by a second marriage to an Armenian princess in favour of his son-in-law, John III Doukas Vatatzes (1221–54), most likely on the grounds that his son was still a child. John III was succeeded by his son Theodore II (1254–58), who in turn was followed by his son John IV (1258–61). The chief aim of the foreign policy of the Laskarids was the recovery of Constantinople, whether by diplomatic or military means. Theodore I suffered a big defeat by the Latins in October 1211. Subsequently, he attempted to forge a dynastic alliance by marrying a Latin princess as his third wife and by arranging a marriage for his daughter to the Latin emperor Robert de Courtenay (1221–28), but in the second case he met with ecclesiastical opposition. John III Vatatzes was more successful in his foreign policy. He drove the Latins out of northwestern Asia Minor in 1224, repudiated the claims of the rulers of Epirus, and recovered Thrace in 1235 and Macedonia in 1246 from the Bulgarians. By the end of his reign, John III Vatatzes had reduced the territory of the Latin empire solely to Constantinople and its environs.

The Laskarids of Nicaea were not only good statesmen, but also generous patrons of arts and letters. Nicaea became known in this period as "the new Athens" and a centre of Hellenic education. The court in Nicaea and Nymphaion included such scholars as the polymath Nikephoros Blemmydes (1197–1272) and the emperor Theodore II Laskaris. Theodore II Laskaris saw himself as a Platonic philosopher-king, and wrote numerous theological and rhetorical works as well as a political treatise based on Isocrates and Aristotle. A new sense of Hellenic identity developed in Nicaea at the expense of the traditional Roman one. Still, this shift was far from complere, and was suppressed to a large extent by the recovery of Constantinople in 1261 and the revival of old ideological constructs.

The Greek population of Asia Minor cherished the memory of the Laskarids after the demise of their dynasty. After Michael VIII Palaiologos usurped the throne in 1261, the people of Nicaea rebelled in support of the child emperor John IV Laskaris who was to spend the rest of his life imprisoned in a castle in Dakibyze on the Sea of Marmara. The patriarch Arsenios (1254–60 and 1261–65) excommunicated Michael VIII for blinding John IV Laskaris, but paid for this daring behaviour with his deposition. His followers, the Arsenites, were not reconciled with the Palaiologan dynasty until 1310. Supporters of the Laskarids in Asia Minor backed the rebellion of the general Alexios Philanthropenos during the reign of Andronikos II (1282–1328) in 1295. A conspirator against Andronikos II in 1305–06 sought popular support by pretending to be the legitimate emperor John IV Laskaris. In a similar way to the posthumous fame of John III Vatatzes, John IV was honoured as a saint in the 14th century. While the cult of John III Vatatzes was centred in the region of Magnesia in Asia Minor, however, the relics of the last Laskarid ruler were venerated in the monastery of St Demetrios in Constantinople itself.

Latin Empire 1204–1261

The Latin empire had its formal beginning with the election of Baldwin of Flanders as the first Latin emperor on 9 May 1204 and his subsequent coronation on 16 May, just over one month after the capture of Constantinople by the army of the Fourth Crusade on 12 April. Its end as a political and military entity came 57 years later on 25 July 1261, when Baldwin II fled the city in the face of the entry of a Greek force from Nicaea led by Alexios Strategopoulos in the name of Michael VIII Palaiologos. For the period of its existence, the empire had been governed by a succession of five emperors: Henry (1206–16); Peter de Courtenay (1217); Robert (1221–28); John de Brienne (1229–37); and Baldwin II (1237–73). Paradoxically, the line of titular Latin emperors, which came to an end only in 1382 with the death of Jacques des Baux, may be said to have exerted far more political influence than their predecessors who actually ruled in Constantinople. It was an indicator that the Latin empire depended on material support and patronage from the Latin west.

Judgements on the empire and its rulers have been harsh: a barren and bankrupt experiment that in no way matched the great days of Byzantium. Certainly the new empire had tremendous military and financial problems which it was never to solve; yet it did mark a watershed in the place of Constantinople and its rulers in East–West relations. Conceived from the start as a territorial empire, the Latin empire never controlled very much land outside Constantinople itself, but it did incorporate that city very much into Western Christendom and to some extent established a Western ownership of the city which was to continue after the expulsion of the last Latin emperor by the forces of Michael VIII Palaiologos in 1261. Its brief existence was also to mark a substantive change in Western perceptions of subsequent Byzantine emperors and brought the latter much more into a reactive relationship with the West—initially in fending off Western attempts to recapture the city, and to unite the Roman and Orthodox Churches and latterly to work with the West in resisting Ottoman expansion. Constantinople had not endured to the Second Coming as many had foretold, and after 1261 the economic, political, and even cultural organization of the West was outstripping that of Byzantium.

The Latin emperors used Byzantine ceremonial and titles, but their administration and council were based on Western lines. The new Latin emperorship, no matter what Byzantine traditions it might seek to echo to reconcile its Greek subjects, was never fitted by either the pope or other Western rulers into the imperial model worked out in the West since AD 800.

Baldwin I was never regarded as one of the universal authorities in the medieval world who could create kingdoms and principalities; yet in the world of the Aegean he was to do just that with regard to lands in western Turkey, Thessalonica, and Achaea. Unlike his Byzantine predecessors he had his imperial title confirmed by pope Innocent III. This was necessary for papal support; but it also signalled that the new empire marked the union of the Greek and Latin communions, admittedly more in desire than in fact. Baldwin's title was the same as that used by his Byzantine predecessors. In its Latin version it ran *Balduinus, Dei Gratia Fidelissimus in Christo Imperator, a Deo Coronatus, Romanie Moderator et Semper Augustus.* Baldwin wore Byzantine imperial regalia and followed Byzantine imperial protocols, possibly to some effect among his Greek subjects; but despite all this the Latin emperors never gained imperial recognition in the West. Baldwin and his successors were always deferential to the pope, whose support they needed, and in no way did they exhibit any caesaropapal behaviour. Papal support was worth having. Pope Honorius III coined the epithet *Nova Francia* in 1224 to bolster Western and particularly French support for the new Crusader states in the Aegean. In times of military setback the pope would preach crusades to bolster the Latin empire as in 1223, 1262, and 1264, but these calls lacked appeal to would-be Western crusaders. The negative side of all this was the presence of a succession of papal legates in Constantinople which prevented the Latin emperors from working out any religious modus vivendi with their Greek subjects similar to that agreed by the Western rulers of Achaea.

From the start the emperors were advised by a council of their own choosing made up of their household officials and men who had their trust. This had led to difficulties with those excluded from these councils, particularly the Venetian interest in the city. In October 1205, on taking over the regency after the capture of his brother Baldwin I by the Bulgarians, the future emperor Henry of Hainault (1206–16) agreed to be advised by an "official" council made up of the Venetian *podestà*, the *podestà*'s council, and, somewhat vaguely, the principal Frankish vassals of the empire. This might answer an emergency situation when it was unclear whether Baldwin was alive or dead, but no ruler could be bound in this way for long. In practice two councils, the personal and the official, worked in parallel and sometimes in opposition. The Latin emperors seemed keen to use Greek advisers in their inner council, which provoked complaints to Western rulers from those in Constantinople who felt that this was inappropriate. This in turn led to interference from Western backers like the pope and the French royal family. The circumstances of the creation of the Latin empire by the contracting parties to the Fourth Crusade also meant that its sacramental basis was weakened and led to an attempt to define and thus limit imperial powers. This conformed with contemporary western-European constitutional developments and it is certainly not improbable that the barons of the Fourth Crusade had ideas of their own about the limitation of monarchical power.

The pact of March 1204, which had been primarily concerned with unity in the Crusader ranks at a time of crisis, had made provision for the election of an emperor and a Latin patriarch, for the division of spoils, and the carving out of fiefs. After the conquest it received surprising significance in the Latin empire. Each new emperor confirmed the pact on his accession and as such it acquired the status of law. It has been called the constitution of the Latin empire, yet it had nothing to contribute to the organization of the Latin state, but was concerned with protecting sectional interests and limiting the executive functions in all but name.

The partition of the former Byzantine empire which followed in October 1204 created spheres of influence rather than defining territorial grants. This was inevitable in that all lands of the former Byzantine empire had to be conquered and held by would-be Western rulers. The emperor received one quarter of the notionally available land; the remainder was divided between the other Crusaders, including the Venetians. The emperor's sphere was limited to parts of Constantinople, to eastern Thrace, and to Bithynia and the Troad in Asia Minor, an area roughly conceived as west of a line from Nicomedia to Philadelphia. Certainly in these areas the first Latin emperors sought to secure support by generous land grants and the creation of dukedoms. In all three areas the new empire confronted formidable enemies that did not permit the establishment of these lordships. Not only did the empire fail to expand, but after 1205, with a brief interlude between 1208 and 1211, it was on the defensive on all its borders.

The emperor was the suzerain of the Frankish states of the Aegean, yet this suzerainty had to be enforced and exercised to be effective. The defensive stance of the empire itself meant that only on occasion could this in fact be done. The Western conquest of Greece was carried out under the direction of Boniface of Thessalonica (d. 1207), a rival, rather than by Baldwin or Henry. The Latin emperors were clearly aware of this problem and, as soon as circumstances permitted, in March–May 1209 Henry visited central Greece and imposed his authority over the Western rulers there; but soon the emperors became preoccupied with defending their own frontiers against the Greeks of Nicaea and Epirus and against the Bulgarians. Conflict on three fronts left little time for exercising overlordship over Greek lands, establishing settled revenue streams, or reconciling Greeks to Latin rule.

In 1204 the Crusaders had rudely rejected the overtures of Kalojan and his Vlacho-Bulgar confederacy. In April 1205 he routed a Latin army near Adrianople, capturing the emperor Baldwin and killing some leading barons. In the next two years Thrace was ravaged and Kalojan began a campaign of extermination designed to win over Greek supporters of the Latin regime. The loyalty of the Greeks was critical to the Latin position, which now quickly deteriorated to the north and west of Constantinople. In April 1205 over 7000 Latins lost confidence in the future of the new empire and returned home. The Latin position in Thrace was saved only by the death of Kalojan in October 1207. The Latins had failed to capitalize on the advantage they had gained with the capture of Constantinople. They had not gained the dominant position in the Aegean and instead had become merely an additional element in the regional mosaic made up of the Byzantine successor states in Nicaea, Epirus, and Trebizond, and the Bulgarian power bloc to the north. None of these elements was powerful enough on its own to knock out the others. The Crusaders were quickly to develop a policy of negotiating to preserve their position. The odds were tipped against them.

Attrition and the backflow of Western settlers would eventually favour natives over incomers.

Immigration and reinforcements from the west were fitful and disappointing. Direct appeals for reinforcements were made in 1204, 1205, 1206, and 1212. A crusade, mounted mainly from northern Italy in 1223 to relieve Thessalonica, was poorly coordinated and broke up. Papal taxation of the clergy in support of the empire roused resentment in the west. The 30th request in 1239 went uncollected, a subsidy proposed in 1245 was still being collected in the 1260s, and another subsidy proposed by pope Urban IV in 1262 to restore the emperor Baldwin II seems never to have been collected.

The Latin empire was both a symptom and a casualty of changing western-European interests and perceptions. Founded as a staging point for the liberation of the Holy Land, it became just one of a number of worthy options as the variety of crusading experience widened in the 13th century. The anonymous annalist of the abbey of Santa Justina at Padua penned the epitaph of the empire in 1262 as but "a shadow of a great name". However, in a purely Aegean context, it did shield the developing states of Frankish Greece from the principal aggressors of the region in the early 13th century and allowed them some space to develop structures which enabled them to survive until the 15th century.

PETER LOCK

Summary

Dating from 1204 to 1261, the Latin empire began with the capture of Constantinople by the Fourth Crusade. Dependent for material support and patronage from the Latin west, it incorporated the city of Constantinople into western Christendom. It included parts of the city, eastern Thrace, Bithynia, and the Troad. Never vigorous, the empire eventually succumbed to Western apathy and Eastern aggression.

Laurium

District in Attica

The district of Laurium played a pivotal role in the history of ancient Athens. It covered an area of about 200 square km, extending from Anaphlystus south to Sunium and then north to Thoricus. Hilly with only a few plains and subject to scarce rainfall, Laurium's importance in antiquity lay in its argentiferous lead, mined by slaves for centuries. Mining may have occurred as early as the Middle Bronze Age (at least at the site of Thoricus), when open-cast mining was used to extract silver and lead. As excavations have shown, mining in Laurium continued down through the Archaic period. Shafts or adits were sunk to reach the highly argentiferous ore deep under the surface; while some shafts were simple passages cut into the ground, other shafts reached a depth of over 130 m and were fitted with wooden ladders, huge galleries, and ventilation shafts. The extracted ore was sent to workshops (*ergasteria*), which included grinders, washeries, cisterns, furnaces, and cupellation work-areas. Athens considered the mines state property, but leased them at annual fixed rates (typically 4 per cent) to private individuals or companies (*poletai*), which employed slaves and condemned criminals. (Many of these lease arrangements have been published; see the bibliography below.) The mines proved especially important in the 5th century BC. In 483 a particularly rich vein was struck at Maronea, immediately yielding 100 talents of silver. With the Persians advancing on Greece, the Athenians, on the advice of Themistocles, elected to use the silver to finance an additional 100 triremes; the augmented Athenian fleet defeated the

Laurium: washery used in processing lead ore

Persian navy at the decisive battle of Salamis in 480, preventing a barbarian conquest of Greece. The mines continued to produce large amounts of silver during the century as Athens built its maritime empire. In the later stages of the Peloponnesian War, production ceased when the Spartan army, on the advice of the renegade Athenian general Alcibiades, occupied the nearby mountain pass of Deceleia, thereby blocking the land route from Euboea to Athens. In 413 over 20,000 slaves at Laurium reportedly defected to the Spartans. The mines were reopened after Athens had established in 377 the Second Athenian Confederacy; extensive mining was conducted for the rest of the 4th century. However, mining ceased in the 3rd century (the last dated lease is from 306 BC) due to a precipitous decline in the price of silver caused by the flooding of Macedonian gold coinage. Limited and sporadic mining occurred down to the end of the 2nd century, but slave uprisings in the 130s and 100s helped bring about the closing of deep mining. During the Roman empire slag heaps on the surface were resmelted, but otherwise the area was abandoned. It is estimated that altogether 2,000,000 tons of ore were smelted, with a yield of 1200 tons of silver and 400,000 tons of lead. The mining and processing of cadmium, magnesium, and lead continues in the area to the present day.

The administrative and economic centre of ancient Laurium was the city of Thoricus, located in the very northeast corner of the district. The ancient site is spread over on the side and top of the mountain Velatouri; its harbour, a refuge fortress built during the Peloponnesian War on the St Nikolaos peninsula, also served as a naval base. The lower slopes of the mountain were ringed by a fortification wall. Inside the wall are remains of numerous houses, workshops, ore washeries, an extensive industrial quarter, three sanctuaries, and a theatre. The theatre, with a unique design and shape, was first built in the 6th century BC and later expanded in the mid-4th to a seating capacity of 5000–6000; a temple of Dionysus formed part of the west entrance. Nearby necropolises have yielded nearly 200 tombs from the Protogeometric to the Hellenistic periods; some of the Geometric houses found among the graves show signs of silver working. Higher up, on the Velatouri, are prehistoric remains. Three Mycenaean tholoi or beehive tombs and a Mycenaean chamber tomb have been excavated; signs of cult worship in the Archaic period are evident. Trial trenches have demonstrated that the acropolis was inhabited as early as the beginning of the Early Bronze Age (*c.*2900 BC) down through the Geometric period, when houses were built over the remains of prehistoric dwellings. The site was abandoned during the early Roman empire. Neighbouring silver-mining sites in the Agrileza district, Pountazeze Bay, Mekala Perka, and Gaïdhouromandra Bay have recently been uncovered.

Summary

A district of southern Attica, Laurium was of particular importance for its silver and lead mines. Mining may have started as early as the Middle Bronze Age, but it became especially significant in the 5th century BC. The discovery of a very rich vein in 483 enabled the Athenians to build a fleet of 100 extra triremes with which they defeated the Persians at Salamis. Mining on a large scale ceased in the 3rd century BC. Mining of other metals continues today.

Lausanne, Treaty of 1923

The Treaty of Lausanne, an international agreement signed by, among others, Britain, France, Greece, and Turkey, in July 1923, was a remarkable Turkish achievement and a heavy blow for Greece and its visions of a greater Greece. Alone among the countries defeated in World War I, Turkey was able to reject, by force of arms, the terms imposed on it by the victorious allies at the conclusion of the war. The treaty signed at Lausanne rendered null and void the Treaty of Sèvres (1920), which had carved up the Ottoman empire and distributed the various pieces to the victors, and gave to Turkey the territorial integrity and full independence that the Ottomans had lost as a result of their defeat in 1918. For the Greeks, the most consequential sections of the treaty were those that settled the territorial and population issues remaining between the two countries as a result of war and the upending of international agreements. Greece had formally to surrender eastern Thrace, several Aegean islands, and the city of Smyrna and its hinterland in western Anatolia. All of these territories had been awarded to it in the Treaty of Sèvres of 1920. In addition, the long and vibrant history of Hellenism in Asia Minor was brought to a close. All "Turkish nationals of the Greek Orthodox religion established in Turkish territory" (with the exception of those living in Istanbul) were to be forcibly sent to Greece, in exchange for "Greek nationals of the Muslim reli-

gion established in Greek territory" (with the exception of the Muslims of Thrace), who had to depart for Turkey. It is estimated that about one and half million Greek Orthodox and half a million Muslims were affected by this population exchange.

The reason that the settlement so favoured Turkey was simple: between 1920 and 1923 the Turkish nationalists had realized an amazing string of military victories. Accustomed to dealing with an obsequious Ottoman sultan, the Allies were astonished to learn, in February 1920, that an army of 20,000 Turkish troops operating deep inside Anatolia under the command of Mustafa Kemal (later Atatürk) had defeated a small French contingent at Marash in southern Anatolia. But this was just the beginning. By an odd coincidence, the very month, May 1919, that Mustafa Kemal began his journey into Anatolia, the Greek government received permission from the Allied powers to land Greek troops in Smyrna on the coast of western Anatolia. The understanding was that the Greek government would administer Smyrna and its hinterland, with a Greek population of more than one million, for five years. At that point a plebiscite on union with Greece would be held. Finally, it seemed, the Greeks were going to be able to build the Greece of "Two Continents and Five Seas" that they had dreamed of for so long. Greek troops quickly landed and occupied not only the territories assigned to them, but began to advance into the interior of Anatolia as well. Thus it was only a matter of time before they would run into Kemal's army. Kemal and his forces were determined to reverse the dismemberment of Anatolia that the Allies (including Greece), in collusion with the Ottoman sultan, had begun to implement. It was at the Sakarya river, deep inside Anatolia, that Kemal, in August 1921, managed to stop the Greek advance, although he had to sustain severe casualties in order to do so. The Greek army, stranded in the interior of Anatolia and deserted by its allies, began to retreat. The final blow came one year later, when Kemal launched his final offensive and drove the remaining soldiers, along with civilian refugees, into Smyrna and, famously, even into the sea itself.

The expulsion of the Greek community of Asia Minor was a singular event in modern Greek history and came to be known as the Great Catastrophe. The Treaty of Lausanne was as bitterly resented in Greece as the Treaty of Sèvres had been in Turkey. It brought to an end the pursuit of the Great Idea, which had dominated Greek politics since the middle of the 19th century. The Great Idea envisioned the expansion of the Greek state to include all the Greek communities (however defined) of the Balkans and the Near East. Now that dream had to be abandoned and Greece had to come to terms with the disaster that had befallen it.

The population exchange enforced by Convention VI of the Treaty of Lausanne continued and actually reinforced the demographic upheaval that had been ongoing in the Balkans and the Near East since 1912. As war engulfed the region, first the Balkan Wars, then World War I, then the Graeco-Turkish War, and the War of Turkish Independence, many people found themselves on the wrong side of the border and began to flee. In 1912, for example, 100,000 Balkan Muslims fled before the successful armies of the Balkan League. The result of this massive flight over the course of a decade was a radical restructuring of the area's population in the direction of what was considered to be greater ethnic homogeneity. Against the backdrop of such extreme violence, the European diplomats who worked out the idea of a formal population exchange felt that it was the best way to ensure stability in Europe. Others, however, were uneasy with this method of dealing with the problem of minorities. A Red Cross officer writing at the time pointed out that neither the Greeks of Asia Minor nor the Muslims of Macedonia had any desire to leave their homeland. Greek refugees marched by the thousand in Athens, carrying black banners of mourning at the Lausanne decision that they must never return to their homes. Despite the general feeling of a catastrophe, the Greek government was able to derive at least one significant benefit from the massive influx of refugees. By settling large numbers in Greek Macedonia, they effectively Hellenized an area where non-Greek populations had historically been strong.

Law

Evidence for the legal history of Greece is patchy. For some periods there are only the legislative texts, for others only contracts or court decisions. In these cases, the extent of the gap between the law and its application remains unknown. This article will attempt to provide a brief overview of the available sources of law in different historical periods. For reasons of convenience the discussion is divided into four chronological sections: (1) antiquity (late-7th century BC to AD 212), (2) the Romano-Byzantine period (AD 212–1453), (3) the Tourkokratia (1453–1821), (4) modern Greece (1821–present).

Antiquity

The sources of law in ancient Greece include inscriptions preserving laws and decrees of the assemblies of the city states, private transactions (sales, manumissions, wills, leases, loans), interstate agreements, lawcourt speeches pertaining to political and legal disputes in 4th-century BC Athens, philosophical and

sociological treatises, and, to a lesser degree, literature (comedy and drama). A particular case in the ancient Greek world is Egypt under the Ptolemies. The legal system, developed over almost ten centuries, is preserved in numerous papyri written in Greek, including all kinds of documents from receipts for deliveries and censuses to marriage and divorce agreements, inheritance settlements, loans, etc.

The several hundred tablets of Linear B, the earliest deciphered form of writing in Greece, from 13th-century BC Pylos, Knossos, and Thebes reveal very little, if anything at all, about the legal aspect of Mycenaean society. They relate mainly to the administrative structure of these kingdoms and the status of the land.

The earliest information on law concerns procedural affairs or what is sometimes called dispute settlement. In the 8th-century society of the Homeric poems and especially in the famous scene on Achilles' shield (*Iliad*, 18. 497–508), the disputants over the payment for homicide present their case to the assembled elders. Hesiod, the next earliest source, refers to gift-devouring kings when it comes to adjudicating disputes. In the late 7th century BC there was a wave of legislators, especially in the colonies of southern Italy (Zaleucus Epizephyrii at Locri, Charondas at Catana) and only subsequently in Athens (Draco), Sparta (Lycurgus), and Mytilene (Pittacus). The content of their legislation is preserved in a piecemeal way by later authors, who underline the moral and pedagogical aspect of their legislation (laws about revenge, about amending laws, banning the sale of land, regulating family life, etc). The first firmly attested laws come from late-7th-century Crete. They mainly concern procedural matters, such as the ban on magistrates serving a second term in office in the small town of Driros (*M-L*, 2). However, the most famous example of legislation from Crete is the early-5th-century inscription known as the "law-code of Gortyn" (*IC*, 4. 72). The Gortyn laws regulated property affairs between spouses in case of divorce or death, inheritance, adoption, sexual offences, personal status, and procedural matters associated with them. Recent research suggests that these laws did not form part of a codification programme but were the outcome of successive stages of codification and amendment.

The best-known legal system of the ancient Greek world is that of Athens. The first major legislative effort was made by Solon in 594 BC. It comprised constitutional reforms (establishment of a council), the abolition of debts, and innovations in the inheritance laws. Further reforms in the constitutional framework were introduced by Cleisthenes in 509 BC (new administrative units and a reformed council) and in 462 BC by Ephialtes (reduction of the political powers of Areopagus). The text of the Draconian law on homicide survives from the late 5th century. The main characteristics of law in Athens in the 5th and 4th centuries BC were: (1) law thought of as a piece of evidence, (2) the lack of autonomy of the legal sphere, (3) the interaction of politics and law in the domain of public law, (4) the multiplicity of procedures available to the prosecutor, (5) popular courts appointed by lot, (6) lack of definitions of offences, and (7) absence of a professional class of jurists and lawyers.

For the remaining city states and kingdoms, with the exception of the literary (and for some questionable) tradition on the Lycurgan legislation in Sparta, there are only fragmentary and isolated pieces of evidence about their legal systems. These are mainly decrees of the assembly honouring individuals, registers of acts of manumission, of leases, sales of land or other transactions, which do not provide a coherent picture of legal life.

The rise of the kingdom of Macedonia followed by the foundation of numerous Greek colonies in the Middle East, Egypt and Anatolia resulted in the interaction of the laws of the city states among themselves and with the laws of the colonized lands. Egypt is the best-documented example of this interaction between the laws of the Greek settlers, soldiers, and officials and the local population. In Greece proper the Macedonian domination did not affect the legal life of the cities to the point of obliterating their autonomy. Certainly, the kings of Macedonia and their successors granted conquered land and privileges to their friends and friendly cities. But they did not interfere directly with the legal institutions. In the same way, the Roman conquest of Macedonia in 168 BC and of the remaining Greek cities in 146 BC did not mean the abolition of their legal autonomy. Most cities kept their legal institutions and rules except in the area of public law, which had to accommodate Roman wishes. The Romans applied Roman law only to Roman citizens while the affairs of the conquered people and the allies were regulated by the *jus gentium*. That period ended with the grant of Roman citizenship by Caracalla in AD 212 to every free inhabitant of the empire. From that moment, Roman law superseded the laws of the remaining city states. The extent to which local laws and customs disappeared or influenced the application of the rules of Roman law is still debated.

The Romano-Byzantine period

The sources of law in Greece in the Romano-Byzantine period are preserved in the major codifying efforts of Byzantine emperors, such as Theodosius I (379–95), Justinian I (527–65), Leo III (717–41), Leo VI the Wise (886–912), their compilations, and commentaries as well as monographs and the sporadic collections of court decisions. From the 11th century onwards, the archives of the monastic communities of Mount Athos, pertaining to the landed property of the monasteries in Macedonia, provide interesting insights into the sociolegal conditions of the era.

The history of law in Greece in this period joins the development of Roman law. In the late 3rd century AD the need for a collection of the imperial constitutions had become evident. Three attempts were made: *Codex Gregorianus* (AD 291) and *Codex Hermogenianus* (AD 295) were probably private collections containing imperial constitutions from Hadrian to Diocletian, while the *Codex Theodosianus* (AD 438) included constitutions from the reign of Constantine the Great onwards. But the compilation by Justinian known as *Corpus Juris Civilis* (AD 533/4) was more ambitious. It included not only opinions of the most famous Roman jurists (*Digest*), but provisions from previous codes and those approved in the meantime (*Codex*), an introductory course for students of law (*Institutiones*), and laws issued by the emperor (*Novellae*). No commentaries were allowed but only the teaching of law. However, after the death of Justinian two major commentaries on the legislation appeared in the late 6th century AD by Theodoros Hermopolitis and Athanasios Emesinos. In parallel

there were several works addressing the needs of the practitioners of law – *Ropai* (About Deadlines), *Peri Bathmon Syggeneias* (About Kinship), *Peri Enantiophaneion* (About Contradictions). The structure of the administration of justice was reformed by Justinian. Until his reign justice was part of the remit of civic and military officials. Justinian appointed 13 judges to resolve disputes in Constantinople, while appeals were addressed to the emperor's *consilium*. Another aspect was the extension of the *episcopalis audentia*, that is the jurisdiction of bishops to resolve private disputes when the litigants so wished, recognized by Constantine. From this early Byzantine period also date the first collections of ecclesiastical rules, later known with the inclusion of civil rules as *nomokanones*.

In AD 741 the Isaurian emperors Leo III and Constantine V introduced the *Ekloge* (Ecloga), an epitomization of *Corpus Juris Civilis* in a more accessible structure and language. Major novelties were introduced in marriage (recognition of a civil and religious wedding), inheritance, and above all in penal law (limiting the application of the death penalty and the discretion of the judge in imposing penalties). Among other laws issued were the *Georgikos Nomos* (mainly concerning property law) in the late 7th or early 8th century, the *Nomos Rodion Nautikos* (codification of maritime custom of the eastern Mediterranean) in the 7th or 8th century, and the *Stratiotikos Nomos* (pertaining to military penal law) between the late-6th and mid-8th centuries.

The emperors of the Macedonian dynasty (867–1081) reintroduced the legislation of Justinian with *Procheiros Nomos* (879) and *Eisagogi ton Nomon* (*c.*885) in which the dual power of emperor and patriarch in the Byzantine state was recognized as ultimate. Then, in about 900, Leo VI the Wise produced a compilation of the *Digest* in 60 books, called the *Basilika*. The *Eparchike Biblos* (*c.*911 or 963) addressed to the city prefect responsible for the supervision of guilds, contained rules concerning their organization and duties. A significant number of compilations and commentaries were subsequently drawn up, among them the *Epitome ton Nomon* (*c.*913), *Epitome ad Prochiron Mutata*, *Ecloga Privata Aucta* (a collection from the 9th century including rules from the Isaurian *Ekloge*), *Ecloga ad Prochiron Mutata*, *Eisagoge Aucta* (a collection of the 10th or 11th century from the legislation of the Macedonian dynasty), *Synopsis Basilicorum Maior* (a collection of the main provisions of *Basilika* of the mid-10th century), *Tipoukeitos* (an index to *Basilika* by judge Patzes at the end of the 11th century), and the *Ecloga Basilicorum Librorum I–X* (a selection with comments from the first 10 books of *Basilika* composed in the 12th century). In the following centuries three major compilations appeared: the *Synopsis Minor* of *Basilika* in the end of 13th century, the *Prochiron Auctum* (*c.*1300) including regulations from several compilatory works and codes, and the *Hexabiblos* by K. Armenopoulos in 1345, which was a compilation from the *Procheiros Nomos* and other earlier collections in six books, that tried to answer the problems of applying the law. Two teaching handbooks of law appeared, *Synopsis ton Nomon* (11th century) by Michael Psellos, politician and philologist, and *Ponima Nomikon* (*c.*1073) a synopsis of *Basilika* by Michael Attaleiatis.

There were also three major collections of judicial decisions: *Peira, Igoun Didaskalia ek ton Praxeon tou Megalou Kyrou Eustathiou tou Romaiou*, (Know-How, or Teachings from the Acts of the Great Cyrus Eustathios the Roman, *c.*1040–1050), and at the end of the 12th century the decisions of bishops Dimitrios Chomatianos and Ioannis Apokaukos on ecclesiastical and civil law matters. Several monographs were published: among them the most important were *Peri Hypobolou*, *Hypomnema peri Duo Exadelphon Labonton Duo Exadelphas* (Note on the Marriage of Cousins) by Eustathios Romaios, *Peri Diaireseos Phonon kai ton Prospheugonton ti tou Theou Megali Ekklisia* (On the Distinction of Terms and those who Take Refuge in the Great Church of Christ) by Konstantinos Garidas (11th century).

In the 12th century (and probably earlier), the judicial system was divided into courts of higher status with jurisdiction and courts of lower status without jurisdiction. The former could delegate cases to the latter, decide on criminal cases, and authorize certain actions by the litigants. As a rule, the prosecutor/plaintiff had to go to the court of the defendant's place of residence; there was exceptional jurisdiction for the clergy, military, senators, and guild members as well as for fiscal matters.

A new *Nomokanon* appeared *c.*883 including resolutions of synods convened in the meantime. Major works on ecclesiastical law were written by Balsamon and Zonaras, who prepared commentaries on the *Nomokanon*. An encyclopedia of ecclesiastical law with some provisions of civil law, known as the *Syntagma kata Stoicheion* (Elements of the Law) by Matthaios Blastaris, appeared in 1335.

In the 12th and 13th centuries there was a marked decline in legal studies and an increasing involvement of clerics in dispensing justice and theorizing about it. One reason for this may lie in the gradual weakening of the central authority and the Latin conquest of Constantinople in 1204, which led to the fragmentation of political and judicial authority. Crete remained under the influence of Venetian law until 1669; the Ionian islands until 1797. The laws of the Venetian republic and the regulations issued by the governor were applied in the areas where the Venetians were dominant while there is some evidence for the application of customary law. A collection of laws used in the Latin kingdoms of the east (mainly of mainland Greece), known as the *Assizes of Romania*, survives from the early 14th century.

The Tourkokratia

The Ottoman conquest of mainland Greece, which lasted for four and in some areas for five centuries, passed the responsibility for administering justice among Christians to the Orthodox Patriarchate. The legal sources for the period from the 15th to the 19th century include the compilations of earlier Byzantine (civil) law (especially of *Basilika*) and rules of ecclesiastical law, which were made mainly for the use of bishops, and the archives of notaries preserved in the Cyclades and Ionian islands.

Three layers of jurisdiction were created: the Islamic law pertaining to property affairs, the Romano-Byzantine law administered by the Patriarchate and applied in disputes among Christians, and, finally, the locally operating customary law. The main instruments for administering justice by the ecclesiastical authorities were compilations of Byzantine law

(especially Harmenopoulos' *Hexabiblos*) with rules of ecclesiastical law, known as *nomokanones* or *nomika*.

Modern Greece

Law in the modern Greek state closely follows the models established in post-revolution France and Germany. The judiciary is independent from the executive, although the head of the Supreme Court (*Areios Pagos*) is appointed by the Minister of Justice. Judges are professionals, while there is a limited role for juries. Most often codes provide the rules of substance and procedure in criminal, civil, and administrative courts.

During the War of Independence and under the influence of the French Revolution, three constitutional texts were produced (1822, 1825, 1827). Subsequent constitutional law has followed the political history of the country from the demand for a constitution in 1843 (establishing a constitutional monarchy), to the enactment of a new constitution in 1864 (as amended in 1911), to the establishment of the republic in 1924 after the defeat in the Graeco-Turkish war of 1920–22, to the restoration of a constitutional monarchy after the civil war of 1944–49 (1952), and finally to the restoration of democracy following the collapse of the 1967–1974 dictatorship (1975, amended 1986).

In the area of civil law the Bavarian administration ordered the collection of local customs but discouraged the idea of drawing up a civil code. Provisionally, the decree of 23 February/7 March 1835 sanctioned that the compilation of Harmenopoulos (*Hexabiblos*) be used as civil law until the elaboration of a civil code. A civil code was finally introduced in 1946 (amended in 1982) and with it came the abolition of local codes, such as the Ionian Civil Code, the Civil Code of Crete, and the Civil Code of Samos. A penal code was introduced in 1951, and has been amended several times since, as well as a Code of Penal Procedure (1952). A Code of Civil Procedure was introduced in 1968, replacing the one elaborated by Maurer in the 1830s, and has already undergone several amendments. Finally, the entry of Greece into the European Union in 1981 meant the adoption of the legal order of the European Union, since in most cases European legislation and courts prevail over national ones.

Laz

Ethnic group from the Caucasus region

The Laz are a mysterious people to be found in the southeastern corner of the Black Sea, speaking a Caucasian language akin to Georgian. Until the collapse of the Soviet Union about 50,000 Laz-speakers could be found in that country and about the same number in Turkey. Georgian independence, followed by civil war and the secession of Abkhazia, and the dubious status of the district near the Turkish border have confused the issue, with the Laz now scattered among a number of territories and joining a growing band of refugees in the Caucasus. Prior to 1923 the Laz population of this area on the Black Sea was interspersed with the large Greek community around Trebizond. Because the exchange of populations following the Greek defeat in Asia Minor was conducted on religious rather than linguistic grounds, Christian Laz may have been evacuated to Greece. There are references to Laz in Greek statistics, although such immigrants would seem to have been assimilated fairly quickly, and there may be confusion between Pontic Greeks in general, and Laz in particular. Both in ancient and in modern times, Lazica as a geographical term for the Caucasian corner of the Black Sea coast clearly encompassed a great many races other than the Laz. Ancient sources are hardly likely to be specific about the mosaic of different languages in the Caucasus, and since until very recently Laz was not a written language, modern authorities have found it hard to take it seriously.

Lazica appears in Greek legend as Colchis, the land of Medea and the Golden Fleece. A Greek colony on the river Phasis was founded by Miletus. Xenophon in his *Anabasis* encountered tribes hostile to him and to each other. Pliny and Strabo both mention the multiplicity of different languages in the area. Lazica had been part of the empire of Mithradates of Pontus until Rome under Pompey entered the region. For the next 700 years the southern Caucasus was hotly disputed between Persia on the one hand, and the Roman or Byzantine empire on the other, sometimes acting as an independent ally to both sides. Western Lazica generally fell in the Roman sphere. The gold of the Golden Fleece made it valuable, and it was an important staging post on the silk road from China. The coming of Christianity in the 4th century should have strengthened the links with the Roman empire, but the decline of this empire meant that in the time of Justinian I (527–65)

an independent Lazica owed allegiance to the Persians. Procopius describes in long and tedious detail how Justinian reversed this state of affairs. The Arab invasions drove back the Byzantines temporarily, but they never really lost control over the central district near Trebizond in spite of the presence of the Arabs and the Turks and the independent and powerful kingdom of Georgia under the Bagrationi dynasty. The Georgians were Christians and usually allied to the Greeks. Indeed it was the famous queen Tamara of Georgia who was able to help her nephews David and Andronikos Komnenos carve out a domain in Trebizond which survived until 1461.

Laz and Greeks appear to have survived in harmony both in Trebizond and in the multi-ethnic kingdom of the Bagrationis. But the arrival of the Ottoman Turks changed this. Georgia survived with some difficulty until the Russians annexed it at the begining of the 19th century, but it lost control of Lazica. Under the Ottomans in both the Georgian and the Byzantine parts of Lazica, most of the Laz converted to Islam. Some may have already become Muslims at the time of the Arab invasions. As in Albania, in addition to financial benefits for conversion there were linguistic reasons as well. Services in Greek or Georgian are unlikely to have been comprehensible or congenial to the average Laz; Islam is less demanding.

Russian and Turkish troops fought different campaigns in the Caucasus during World War I; as a result the Laz were divided between the hardly sympathetic regimes of Kemal Atatürk in Turkey and the Bolsheviks in Russia. Their language would have been ripe for extinction, but recent interest in minorities and the efforts of the German scholar W. Feurstein to give the Laz a language and an identity may preserve this improbable fossil.

T.J. WINNIFRITH

See also Georgia

Summary

An ethnic group from the Caucasus region, the Laz inhabit the area known to Greek legend as Colchis. Taken for the Romans by Pompey, the region was disputed by Romans and Persians for 700 years but remained largely Christian until the coming of the Ottomans, when most Laz converted to Islam.

Lebadea

City in Boeotia

In antiquity Lebadea was best known as the site of the oracle of Trophonius. Today, it is the largest city in Boeotia.

The town spreads out on both sides of the river Hercyna, which issues from an impressive gorge, dominated at one end by a Frankish castle and at the other by a graceful Turkish bridge. Lebadea lies south of Chaeronea, southwest of Orchomenus, and west of Coronea, from which it is separated by Mount Laphystion. Like Mount Laphystion, the later polis of Lebadea originally belonged to Orchomenus. Legendary connections linking Lebadea and Laphystion to Orchomenus (Trophonius and Agamedes were sons of Erginus of Orchomenus, and Athamas king of Orchomenus attempted to sacrifice his children to Zeus Laphystius) support the impression that Lebadea was originally a dependency of Orchomenus (Lebadea's absence from the Homeric Catalogue of Ships – strongly felt by later inhabitants, who identified their polis with Homeric Mideia – is another indication).

The earliest contemporary references to Lebadea by name occur in the 5th century BC. Lebadea and the oracle of Trophonius seem to have come to the notice of the outside world, that is to say, Athens, at the time of the battle of Coronea in 446 BC, after which the oracle began to become famous. Lebadea was independent by the end of the 5th century BC. Under the federal constitution described by the Oxyrhynchus Historian, Lebadea at this period took turns with Haliartus and Coronea in contributing one of the 11 Boeotarchs (Hell. Oxy. 16 [11]. 2–4). Although attacked and plundered by Lysander in 395, the polis recovered sufficiently to issue its own independent coinage after the King's Peace (the absence of any coins attributable to Lebadea in the late 6th century is another indication that it had not yet become independent at that time).

Lebadea was one of few towns in Boeotia to survive and prosper throughout antiquity. By AD 100 it was one of the most important towns on the mainland, and an almost obligatory stop on any visitor's "grand tour", no doubt because of the oracle of Trophonius, its best-known sanctuary. This was just outside the town, on the banks of the river Hercyna. The oracle functioned as early as the 6th century BC and perhaps even earlier. It shares the characteristics of two distinct types of oracle. The first, exemplified elsewhere in Boeotia at the Amphiareion near Oropus (and also possibly at the Thesprotian Nekromanteion), is one where the god lives underground and is approached directly at night by the consultant. Trophonius' oracle was also one of a number clustered around Lake Copais, each situated more or less at the limits of its polis. Here the predominant features were a hill or mountain represented by a young god, and a spring issuing from it, represented by a nymph who was usually the god's *trophos* (nurse). Divination came through inspiration caused by drinking the water of the spring, which was the real medium.

The traveller Pausanias (second half of the 2nd century AD) gives a vivid description of his own consultation of Trophonius. First, he spent several days in a house sacred to the Good Daemon and Good Fortune, bathing only in the water of the Hercyna, and sacrificing to the divinities of the

sanctuary. The entrails of each victim were scrutinized to see if the omens were favourable. On the night of the actual descent he put on special clothes. The procedure began with the sacrifice of a ram over a pit and invocation of Agamedes: only if the omens from this sacrifice were favourable could the consultation proceed. He was taken to the Hercyna, anointed and washed, and then to two adjacent fountains of Forgetfulness and Memory, from which he drank. Then, after worshipping the early cult image of Trophonius, he proceeded to the oracle, where he was let down into the chasm by means of a ladder. At the bottom he lay on his back, holding honey-cakes in his hands, and thrust his feet and legs into a narrow gap between the wall and floor of the pit, whereupon he was pulled through the hole. Inside he was confronted by the god (Pausanias says that prophecy could come by sight or sound, but does not say what his own experience was), and then thrust out again feet first through the same hole. Back on ground level, he was seated by the priests on the throne of Memory, and asked to describe his experience.

The other important cult at Lebadea was that of Zeus Basileus (the King), probably the same as the god worshipped on neighbouring Mount Laphystion. He is best known in connection with the games called *Basileia*, which the Boeotians, under the leadership of the Thebans, founded to commemorate their victory over Sparta at the battle of Leuctra (371 BC). The Thebans chose the site carefully, to emphasize their own domination of Boeotia and the consequent humiliation of Orchomenus.

The intertwined development of the two cults – of Trophonius and Zeus Basileus – reveals how religion, politics, and commerce interacted in the life of a polis. In the latter part of the 3rd century BC the polis of Lebadea undertook a major building project, which would affect its two outstanding attractions, the sanctuaries of Trophonius and Zeus Basileus. The plan was to build a temple of Zeus – huge by the standards of mainland Greece – on the top of a hill which dominated the route leading past Lebadea to Delphi, as it still does. They also planned to move the site of the oracular chasm from inside the sanctuary of Trophonius to the mountain top. The plan to build the temple failed due to shortage of funds. The project was eventually taken over by the Boeotian Confederacy, but too late, for very soon afterwards the confederacy was dissolved by the Romans and all that was left of the undertaking were the foundations of the building – on the hill called Profitis Ilias – and a pan-Boeotian college of *naopoioi* (temple fabric officers) who, since their work was never finished, were never disbanded.

The other part of the project was completed. It is quite clear from Pausanias that the oracle was not in the sanctuary of Trophonius itself, but beyond and above it, on the hill which also bore the temple of Zeus Basileus. In fact, the remains of this man-made hole were discovered between the foundations of the temple of Zeus Basileus and the chapel of Profitis Ilias (although it has since vanished with the complete rebuilding of the chapel).

Aside from these two important sanctuaries, relatively little is known about public religious activity at Lebadea. There has been no systematic excavation in the ancient town site: accidental finds late in the 1930s revealed evidence for the worship of the mother of the gods, of Artemis Eileithyia, and Zeus Meilichius. Their find spot, although it was clearly not at their original sites, suggests that the sanctuaries of these deities were at or near the outskirts of the urban area of the polis. Pausanias says only that Lebadea had all the amenities of a normal Greek polis, but he does not describe them. To him they were banal, and not as interesting as the oracle of Trophonius.

The oracle operated at least into the 3rd century AD, and possibly even later. The town itself, probably because the hilltop above the gorge of the Hercyna was ideally suited for the siting of a castle, flourished throughout the Middle Ages, being held successively by Franks, Catalans, and Turks. The castle itself may have been built early in the 13th century, during which Lebadea belonged to the dukes of Athens (who were based at Esteves, that is, Thebes). After the defeat of the knights of the Morea by members of the Catalan Company in 1311, Lebadea became for a time the third city of the Catalan duchy of Athens and Neopatros.

In the 15th century, after further vicissitudes, it was ceded to Mehmet II, and remained a major site throughout the Tourkokratia (even today, the elegant bridge over the Hercyna and a small number of buildings – among them, a bathhouse – bear testimony to this period). Greek again since 1829, Lebadea is the capital of the nomos of Boeotia, and the seat of the bishop of Thebes and Lebadea.

Summary

This city in Boeotia was best known in antiquity for its oracle of Trophonius, where the consultant approached the deity directly by descending underground. Lebadea was an important fortified site during the Frankish and Catalan periods, and later flourished under the Tourkokratia. Today it is the capital of the nomos of Boeotia and seat of the bishop of Thebes and Lebadea.

Lemnos

Island in the northern Aegean

The position of Lemnos in the northern Aegean, where it lies midway between the tip of the Mount Athos promontory and the coast of Asia Minor, meant that control over it was always sought after. Any ships entering or leaving the Hellespont (the Passage of Romania, now the Dardanelles) could do so only with the knowledge (and often the permission) of the current

rulers of Lemnos. The frequency with which their identity might change is a symptom of its strategic importance to the Hellenic world throughout its history. The island is now administered under the nomos of Lesbos.

Lemnos has an area of 476 sq km and, like a number of the Aegean islands, its shape indicates its volcanic origins, two bays to north and south almost dividing the island in two; the smaller, eastern, sector was where the capital of the island in antiquity, Hephaestus, was situated, while on the coast of the western sector, larger and much more mountainous with the highest peak of Mount Skopia reaching 430 m, the medieval and modern capital of Myrina is located. The low-lying and flatter areas of the island are quite fertile, and produce a variety of crops. A tradition, already current in antiquity and still existing in the 20th century, credited Lemnian earth, excavated on one day each year, with the power of healing many kinds of wounds; it was exported all over the Hellenic world.

In antiquity Lemnos figured both in Homeric legend and in Hellenic history. Herodotus (4. 145) related how the Argonauts, who according to legend had arrived on the island and left progeny there, were driven out of Lemnos three generations later by the Pelasgi. Later (5. 26) he described how Lemnos, with Imbros, was taken from the Pelasgi by Otanes, who had already occupied Byzantium and Chalcedon. The stronghold of Myrina figured early in the history of the island, as when Miltiades, having called on the Pelasgi to leave the island – a call which the townspeople of Hephaestus obeyed – was defied by the inhabitants of Myrina, whom he besieged (no doubt secure in their rock-perched fortress) before eventually ejecting them by force.

An indication of the importance in the Greek world that Lemnos must already have attained by the early 4th century AD is suggested by the fact that the island's bishop was one of only three from all the Aegean islands to attend the First Church Council at Nicaea in 325. The site of an early Christian basilica is still preserved at Livadochori, close to the narrowest part of the island. The island's ecclesiastical importance was further increased when, under Leo VI (885–912), it was raised to a metropolitan see; this was probably in part due to an attempt to counter the rise of Saracen maritime power in the northern Aegean, and in 924 a Byzantine fleet decisively defeated the Saracens off the coast of Lemnos. By 1136 Venice, already always anxious to establish and extend its trading opportunities, reached an agreement with the island's metropolitan to grant the use of a chapel at the port of Kotsinas (modern Kokkino) in the bay on the north coast; this foothold in Byzantine territory is a further indication of the island's continuing strategic and economic significance.

In the Deed of Partition that followed the Fourth Crusade in 1204 Lemnos was awarded to the new Latin emperor in Constantinople, but he was unable to maintain control of the island and from 1207 it became a domain of the Venetian family of the Navigaiosa, who were styled grand dukes. When the first duke, Philocole, died in 1214, Lemnos remained in the family's control, being divided in half, his son ruling one half and his two daughters the other. This arrangement continued until 1276, when Michael VIII Palaiologos was able to reestablish Byzantine possession. It was inevitable that with the rise of Genoese power in the northern Aegean, and the corresponding weakness of Byzantium, control of Lemnos should pass to the Gattilusi family, with Jacopo Gattilusi (lord of Mytilene) ruling there 1414–19.

It was by chance that in 1442, while travelling back to Constantinople from Lesbos with his young bride Caterina Gattilusi, Constantine Palaiologos, later to become the last Byzantine emperor, stopped at Lemnos; they stayed at the castle beside the port of Kotsinas, first built by the Venetians in 1397, but the Turks had been informed of their presence and blockaded the port. While there Caterina, who probably by then was pregnant, became ill and in August, her condition aggravated by the stress of their situation, she died; she was buried at Palaiokastro, the site of the ancient Hephaestus, but her grave has disappeared. Had she lived for just another seven years, she could have become the last Byzantine empress.

With the fall of Constantinople in 1453 the Gattilusi again controlled Lemnos, but their rule was so oppressive that a secret plea was sent by the people of Lemnos to the Turkish sultan Mehmet II to take over the island. This development was forestalled when, in 1456, the island became involved in a papal crusade carried out in the name of pope Callixtus III to recover Constantinople from Islam. In that year a papal force under a Venetian cardinal, Lodovico Trevisan, occupied Lemnos, Samothrace, and Thasos, installing garrisons and governors in the name of the pope. His successor, Pius II, even founded a completely new religious military order, the Order of Our Lady of Bethlehem, which had its headquarters on Lemnos. These interventions by western powers all came to an end in 1470 with full Turkish occupation.

From then until 1912, when it again became part of Greece and passed to official Greek control, Lemnos was occupied either by the Turks or, briefly, the Russians. It was always to be its strategic significance that gave the island its importance; this was the reason why it figured in numerous 20th-century treaties and agreements. In 1915 the harbour at Myrina became the assembly point for the British fleet that was to make the famous and disastrous assault on the Gallipoli peninsula, and it was only in 1936 that Greece regained the right to fortify Lemnos and Samothrace; as late as 1983 the previous illegal fortification of Lemnos by Greece became the issue which caused the Greeks to withdraw (at Turkish insistence) from a combined exercise of NATO forces.

PAUL HETHERINGTON

Summary

An island located in the northern Aegean, Lemnos is strategically placed to control the passage of the Dardanelles. In the late Middle Ages Lemnos was disputed between the Venetians, Genoese, and Byzantines. It was under Turkish rule from 1470 to 1912, when it reverted to Greece.

Leo III *c.*685–741

Emperor

When the Arabs entered the Byzantine empire in 716, proposing to take Constantinople, they were aware that the general responsible for defending the eastern frontier, Leo, had refused to recognize the de facto emperor, Theodosios III (recently set on the throne by the rebellious army of the Opsikion); they therefore assumed that if they recognized Leo as emperor they would find in him an ally. Leo, realizing that he had inadequate forces to resist them, reached some kind of agreement. The Arab generals had their men proclaim him emperor and, to avoid pillaging the territory under his jurisdiction, led their army into southern Anatolia to winter. As soon as the way was clear, Leo, with his few forces, headed for Constantinople. Theodosios promptly abdicated and entered a monastery. For the seventh time in 22 years the throne had been seized by force. The Isaurian dynasty, which Leo founded, ruled until 802.

When the Arab general Masalmas realized that Leo had tricked him he crossed to Thrace, took a number of minor strongholds, and laid the country waste before moving on Constantinople. In August 717 he set his army in position around the city and had a deep ditch dug around the walls with a drystone wall above it. On 1 September an Arab fleet of 1,800 vessels, comprising large warships and lighter, fast craft, anchored along the sea wall of the city. But because this position was unsuited to a long siege, as soon as a favourable wind arose the fleet started to move to sites where camps could be established; Leo took advantage of their difficulties in the unfamiliar currents, and sent ships equipped to spray them with Greek fire. According to Theophanes, as the fire took hold, some of the vessels were thrown in flames against the sea walls, some went down with all hands, and some were carried, burning furiously, as far as Oxeia and the island of Plateia.

The winter was bitterly cold, and the Arabs' provisions ran out. In the spring supplies were brought by another Arab fleet which, warned of the Greek fire, approached by night, unseen, and went into hiding. It came, however, from Egypt, from the shipyards recently conquered by the Arabs, and the Egyptian crew escaped under cover of darkness and joined the Byzantines, revealing the presence of the fleet and the location of their anchorage. So they too had to face Greek fire; their arms and supplies were seized; and furthermore the warm weather brought disease to the Arab camp. Leo also persuaded the Bulgars to attack them. Finally in August or September 718 the Arab fleet sailed away. This siege of Constantinople is also related in the form of an Apocalypse, with Leo as saviour king.

The Arab siege, which had provoked two attempts at usurpation, convinced Leo that God was displeased. He tried to counteract this by forcing all Jews and Montanists in the empire to be baptized. This did not prevent the fleet sent to quell disorders in Italy from foundering in the Adriatic; and Arab expeditions into Asia Minor resumed, regularly wintering in Byzantine territory.

Then on 26 October 726 the volcano of Thera (Santorini) erupted. Both the historians of the reign, Theophanes the Confessor and the patriarch Nikephoros, agree that this was what moved Leo to take action against icons – wrong action, according to them; but the next uprising (originating in the naval forces and the Cyclades) was successfully suppressed. In the summer a combined raiding party, of 15,000 light-armed Arabs under Omar and 8,500 under Moawiya, appeared before Nicaea. Sources hostile to Leo say that Omar and Moawiya left with a great number of captives and much booty, demonstrating to the impious man (Leo) that he had not overcome them because of his piety, as he boasted; but it was at least to some extent a Byzantine success, certainly claimed by Leo as such, and attributed to correct worship.

Though he is often represented as primarily the initiator of iconoclasm, Leo's two great contributions to history are having interrupted 22 years of successive usurpations and intermittent civil strife, and having taken the first steps towards halting the Arab advance. He also took measures to reorganize an empire fallen into anarchy. Data on this, except for his law code, the *Ekloge*, are minimal. Taxation was a priority: with war permanent and many sources of revenue lost, those that remained had to be exploited with all possible efficiency. Three measures are documented (two because of the opposition with which they met): new fiscal measures were introduced (against which pope Gregory led Roman resistance in 724); registration of male babies was instituted (Theophanes, 410. 9–17); and (a measure mentioned without condemnation) a tax was raised to cover the rebuilding of the walls of Constantinople after the earthquake of 740. Reorganization of the army and of provincial administration were major priorities.

When Leo III instituted iconoclasm, in either 726 or 730, he held mass meetings to explain his policy and win popular support, and repeated this tactic in 740 for the tax to rebuild the walls. The iconoclast emperors were without exception extremely popular with the Constantinople masses (hostile sources underline this as the ultimate proof of their vileness). This understanding of themselves as the ones to whom the people have entrusted power, to whom they are, at least formally, accountable, goes back to Augustus' formulation rather than to Hellenistic concepts of empire, but there are Hellenistic elements present.

PATRICIA KARLIN-HAYTER

See also Iconoclasm, Law

Biography

Born *c.*685 at Germanikeia, Leo was probably brought up in Mesembria. He came to notice as the defender of the eastern frontier. Having forced Theodosios III to abdicate he entered Constantinople by force in 717 and reigned as emperor until 741. His main concerns were with the defence of the empire and of the city against the Arabs.

He revised the laws of Justinian with his *Ekloge* and in 726 he instituted iconoclasm. He died at Constantinople in 741.

Leo V *c.*780–820

Emperor

Leo V (813–20) is most famous for starting the second period of official iconoclasm in the Byzantine empire, in 815. He was born around 780 in the Anatolikon theme (or province) to prominent Armenian parents. His father, Bardas the patrician, may have been the ex-*strategos* (or general) of the Armeniakon theme who was exiled by the empress Irene around 780. Leo may also have been related to the general Bardanes Tourkas, in whose retinue he served during the latter's abortive coup against the emperor Nikephoros I in 802/03. For reasons unknown, Leo deserted Bardanes and joined Nikephoros, being richly rewarded with a military post (commander, or *tourmarch*, of the Federates, a garrison unit in Constantinople) and property in the city. He was joined in his actions by his companions Michael Travlos ("the Stutterer", later Michael II, 820–29) and Thomas the Slav (later to lead a famous rebellion against Michael II that led to Thomas's execution in 823). Leo fell out of favour with Nikephoros I around 808 due to the revolt of Arsaber the quaestor, to whom Leo was related, but returned to imperial favour under his friend Michael I Rhangabe (811–13) in the capacity of *strategos* of the Anatolikon theme. Leo served Michael until the latter's abdication in 813 during a disastrous war with the Bulgarians. At that point he was offered the crown by the senate and the army and entered the capital on 11 July 813. He was immediately acclaimed and crowned, and ruled until Christmas 820, when he was murdered in Hagia Sophia by followers of Michael Travlos. At Christmas 813 he crowned his son Smbat co-emperor, with the new name of Constantine.

The Byzantine sources present a mostly hostile view of Leo because of his decision to restore iconoclasm, which had been officially abandoned at the Council of Nicaea II in 787. Thus the chroniclers speak of duplicity surrounding his accession, including the betrayal of Michael I, but these accounts seem to represent a later blackening of his image. Leo's Armenian stock and the increased presence of Armenians in positions of power during the 8th and 9th centuries also appear to have disturbed some Byzantine contemporaries.

In 813/14 Leo began moves to restore iconoclasm, later arguing that the iconophile ("icon-venerating") emperors before him had all lost their thrones, if not their lives, in disastrous reigns and that this indicated God's displeasure with icons. In this policy he found great favour with sections of the military who still venerated the memory of the great iconoclast emperor Constantine V (741–75). By 815 Leo had summoned the council of Hagia Sophia to revoke Nicaea II, and embarked on a period of persecution of the more stalwart iconophiles, mostly monks and especially those of the Stoudios monastery. He also exiled the iconophile patriarch and theologian Nikephoros (806–15). Leo's motives, however, were less involved with theology than with discipline. Leo, who saw himself as a warrior emperor in the image of the early Isaurians, was concerned that any disobedience to him or his religious policies would undermine his power to control the affairs of state. His iconoclasm does not seem to have involved the destruction of icons, but only their removal from places where they might receive undue veneration.

Even Leo's enemies agree that he was a good ruler and soldier. He managed to reverse the tide against the Bulgars (whose dangerous khan, Krum, died – almost miraculously – shortly after Leo's accession) with great skill and managed to establish a 30-year truce with Krum's successor Omurtag, probably in 816 after the battle of "Leo's Hill" where the Bulgars were crushed.

Relationships with the West during Leo's reign were built on the settlement reached by the Byzantine embassy to Aachen in 812, but by 817 they had stalled on agreement over borders in Dalmatia. In the same year, however, Leo funded the building of the church of San Zaccaria in Venice and sent the saint's relics to the city as a gesture of goodwill. Civil turbulence in the Caliphate also meant that Leo could stabilize the border in the east, and he even managed to rebuild some of the border fortresses lost under Irene (780–802).

Leo's capability was shown not only on the battlefield but also in his attempts to regulate economic and administrative life. Plausible accusations of corruption, depravity, and misrule are curiously quite mild, almost non-existent, in some of the works that nevertheless harshly criticize the emperor's iconoclasm. He was against corruption and appears to have chosen capable administrators, ignoring the fact that many were crypto-iconophiles in favour of their skills and personal qualities. One extant edict attributed to Leo III and Constantine V

Leo V: illustration from the 11th-century chronicle of Skylitzes showing Leo being crowned by his predecessor Michael I Rhangabe in 813, Biblioteca Nacional, Madrid

on divorce and inheritance has been attributed by one scholar (Kresten, 1980) to Leo V and his son Constantine-Smbat.

One of the emperor's proclivities mentioned more than once in the sources is his penchant for prophecies and "holy men" who could predict the length and course of his reign. An important source, now lost and preserved fragmentarily in other sources, appears to have been a long poem by the iconophile monk and saint Theophanes Graptos (d. *c.*843,) based on the curious fates of Leo, Michael, and Thomas, from their days with Bardanes Tourkas to the civil war between Thomas and Michael following Leo's murder. The revolt has been interpreted as a revenge for Michael's actions and as a possible iconophile backlash against Leo's policies, but iconophile sources are almost universally critical of Thomas and the strife he caused.

Leo may have had a great interest in cultural life. He was a close friend of the learned John the Grammarian, the iconoclast intellectual who was to become patriarch in 836/37, and appears to have been interested in music and singing. He was by no means a bigoted sovereign, and members of his immediate family and court were iconophiles, a fact to which he seems to have turned a blind eye as long as they were personally loyal to him and kept their convictions to themselves. His persecution of the iconoclasts was actually light, even by 20th-century standards, and today one senses the strain of iconophile apologists in trying to fit Leo into the mould of tyrant.

The murder of Leo V by Michael II was, curiously, avenged by Michael's son, Theophilos, when he ascended the throne in 829 and arrested those who had hewn Leo down while singing vigorously near the altar in Hagia Sophia on Christmas Day 815.

Many modern Greek accounts of the Byzantine empire ignore the rejection of Leo's qualities by Byzantine sources and stress his forceful actions to save the state and his keen sense of justice and administrative propriety. As such, they reflect the western Enlightenment verdict on Byzantium, which tended to see all supporters of the traditional ecclesiastical and theological order as enemies of progress and champions of superstition.

Biography

Born *c.*780 to Armenian parents, Leo "the Armenian" grew up in Anatolia. For service to Nikephoros I he was rewarded with a military post and property in Constantinople. He served Michael I as general and became emperor after the latter's abdication in 813. Leo was a good soldier and an effective administrator but is best known

for restoring iconoclasm in 815. He was murdered in Hagia Sophia in 820.

Leo VI 866–912

Emperor

The emperor Leo VI (886–912) earned the epithet "the wise" in his own lifetime, and part of the explanation for this is his extensive literary activity. He spent most of his life in the city of Constantinople, and has the image of a sedentary scholar emperor. An episode in the *Life* of St Blasios of Amorion describes how Blasios, when in the palace for an audience with the emperor, stumbled by accident upon Leo; as the emperor was occupied with calligraphy, as was his custom, Blasios did not initially recognize him. A number of poems and speeches dedicated to Leo by contemporary authors also celebrate his wisdom and erudition. It is known that he received an appropriate education for a child of the imperial family, and at one time was taught by the famed Photios. As such Leo's work appears to owe a debt both to this master and to the cultural trends of the day, when Byzantium was reclaiming the knowledge of the past under the impetus of the iconoclastic debate. Leo was active in many literary fields, including poetry, homilies, military manuals, and legislation.

Leo seems to have had a particular enthusiasm for hymns, and produced texts of his own. Eustratiades has even described him as one of the most important Byzantine ecclesiastical poets; the emperor's most familiar piece is the anacreontic ode on the Second Coming. But Leo did not just write ecclesiastical poetry; it is known that he wrote poems on the fall of Thessalonica, the desertion of Andronikos Doukas, and his brother Alexander, though none of these texts has survived. He also composed and recited a poem in order to persuade bishops to support ecclesiastical toleration for his fourth marriage. Leo composed his verse in anacreontics, a form fashionable among the 9th- and 10th-century literati.

Leo is perhaps best known as a speech writer, homilist, and orator, due to the survival of a collection of his work. This collection contains 40 texts, and was probably produced during his own lifetime for his spiritual father the monk Euthymios. It incorporates speeches on feast days, saints' days, dedication days of churches, and other unique occasions – most famously Leo's *Epitaphios* on his parents; it seems that the last text was written not at the time of Basil's death in 886 (Eudokia had died first, *c.*882/83) but two years later. Antonopoulou (p. 259) opines that Leo's homiletic work marks a stage in the genre at which the rhetorical execution of the speeches was more significant than the dogmatic message, and that his homilies are "the first to display so consistently the preferences of the following generation".

Leo's overtly religious bent (scholars have noted his infrequent use of the Classics over traditional ecclesiastical texts; for instance the *Epitaphios* owes much to Gregory of Nazianzus' funeral orations on his brother Caesarius and on Basil the Great) is again reflected in a work of spiritual advice on the monastic life, organized in 190 chapters. It seems likely that this text was composed for Euthymios and his monastic community, whose monastery Leo had built and patronized.

While Leo's literary work seems to be dominated by religious and ecclesiastical concerns, his most famous single text is probably the *Taktika*, a military manual. Dating from around 900, and addressed to a generic general, it consists of an introduction, an epilogue, and 20 constitutions. The value of the text for the study of the late 9th-/early 10th-century Byzantine army is called into question by historians, for it is in fact based extensively on pre-existing military handbooks, notably the 6th-century *Strategikon*, the *Strategikos* of Onesander, and the *Tactica Theoria* of Aelian. However to Leo's mind this clearly enhanced the importance of his work, not the opposite. Despite its literary debts, Leo did add some new material as well, most notably a section on the Arabs, and a constitution on naval warfare. It is worth noting also that the *Taktika* is not the only military text connected with Leo VI. In his youth he produced the *Problemata* (again exploiting the 6th-century *Strategikon*), and the *Taktika* itself refers to another work of Leo's, a compilation of excerpts on warfare. The emperor also commissioned a text dealing with imperial military expeditions, produced by Leo Katakalon.

The *Taktika* is marked by the didactic, legislative character of 9th- and 10th-century literature which is taken to exemplify the revival of knowledge in this period, the so-called Macedonian renaissance. But Leo was also active in the field of pure legislation (again redolent of the Macedonian renaissance). Not only does it seem that it was under Leo that the *Basilika* project of Basil I was completed, but Leo issued his own collection of new laws (*Novels*) – again inspired by the work of Justinian I (527–65), and in some cases a direct response to that emperor's own *Novels*. (Schminck [1986], also argues that the *Procheiron*, a legal handbook issued in the names of Basil, Constantine, and Leo, was in fact a revision of the *Epanagoge*, to remove the taint of Photios.) But the legislative work of Leo forms a bridge to his other writings, for it is characterized by its rhetorical and advisory style.

The rhetoric-loving Byzantines also valued highly the art of letter writing, and we have references to letters that Leo wrote, but unfortunately no examples of his literary activity in this area have survived.

As noted, much of Leo's work epitomizes the style and type of literature produced during the so-called Macedonian renaissance of the 9th and 10th centuries. Leo's unique contribution was perhaps the fact that he was an *imperial* author. In this sense his greatest impact seems to have been upon his son

Constantine VII Porphyrogennetos (913–59), who stands as the epitome of the encyclopedic movement, but who owes much in reality to the example of his father. Indeed it was under Constantine VII that the *Taktika* was copied and incorporated into a corpus of strategic writings, and it was Constantine who found and exploited Leo Katakalon's text dealing with imperial military expeditions. In the wider field Leo's *Taktika* appears to have spawned a host of 10th-century tactical writing; he is acknowledged, and used, by subsequent texts linked with Nikephoros II Phokas and Nikephoros Ouranos.

Beyond his legislative work Leo's reign was marked by the scandal over his fourth marriage (the tetragamy), the military threat of both Bulgaria and the Arab navy, and notable relationships with his military and civil officials. Leo married for a fourth time in 906, following the birth of a son to his lover Zoe Karbonopsina. However, fourth marriages were illegal and Leo found himself excommunicated, though he planned to have his marriage sanctioned by the church. This was granted in 907, though Leo had had to depose the patriarch of Constantinople for his opposition prior to the meeting of the synod. During Leo's reign the recently Christianized Bulgaria emerged as a military threat in under its khan Symeon (893–927); several conflicts marked the 890s, but a peace was finally concluded in 896. At sea the Arabs proved devastating, striking key sites such as Samos, Demetrias, Lemnos and Thessalonica, approaching Constantinople itself in 904. Leo responded to this situation by making Himerios admiral; he led the Byzantine navy to some success though a campaign to Crete in 911 failed. Internally Leo fostered close relations with his military and civil officials (notably his eunuchs). This seems to have resulted in some tensions; the eunuch Samonas's machinations seem to have caused the general Andronikos Doukas to flee to the Arabs in 906.

But one of the most enduring legacies of Leo VI is his peculiar connection with the prophet Leo the Wise and his oracles, as studied by Cyril Mango in his classic "The Legend of Leo The Wise" (1960). Mango argues that Leo VI became linked with the figure of the prophet through a confusion with Leo the Philosopher especially but also with Leo Choirosphaktes, though it could be argued that Leo VI had as much a stake in the creation of the prophet as these two men (see, for instance, Magdalino, 1988). A set of oracles, with illustrations, was known by the 12th century, and a second set emerged probably in the 13th century. After the fall of Constantinople the oracle collection attained mass popularity in East and West, and remained salient for the East due to the Turkish occupation.

SHAUN TOUGHER

Biography

Born in 866 probably in Constantinople, the second son of Basil I, Leo was a pupil of Photios and received a good education. He had a bookish reputation and was known as "the wise" during his lifetime. A collection of his homilies and a military manual survive; he also wrote poetry and hymns and issued legislation. His fourth marriage caused controversy. He died in Constantinople in 912.

Leo the Mathematician *c.*790–after 869

Scholar

Born around 790, Leo studied "grammar and poetics" in Constantinople, and "rhetoric, philosophy, and arithmetic" on the island of Andros, where he "happened on a learned man". (It has been suggested that he went to Andros because no one who taught these subjects could be found in Constantinople, but there is no evidence for this; education was at a low ebb, but the degree has been much exaggerated.) Having mastered the elements of these disciplines, Leo "headed for some mountains" where he found monasteries with manuscripts that enabled him to pursue his studies. He returned to Constantinople "master of philosophy and her sisters, arith-

metic, geometry, astronomy, and music". (The Pythagoraean relationship between philosophy, mathematics, and music was still dominant.)

Back in Constantinople, Leo earned his living by giving lessons privately for several years before coming to the attention of the emperor Theophilos (829–42). This occurred, say the chroniclers, when a mathematician pupil of his was taken prisoner and brought before the caliph Mamun (813–33), who was known for his interest in Greek science. When Leo's pupil informed Mamun that his mathematics were as nothing compared to his master's, Mamun, already impressed, wrote to Leo, offering him great wealth if he would come to his court. Leo turned the letter in to the palace, where it was submitted to the emperor; he promptly sent for Leo and, recognizing his gifts, set him up to "teach publicly".

To this period must be dated a great technical achievement of Leo's: news of frontier violation reached Constantinople, through a chain of beacon-lights, within the hour, it is estimated, from the fortress at Loulon, just north of Tarsus. The message had been simply that there was frontier trouble; but Leo made it possible to choose between 12 different messages, identified by the hour of arrival. Only three of these have come down to us: hour one meant a small raid; hour two, full-scale war; hour three, enemy incendiarism. Achieved through the synchronization of clocks in Constantinople and at Loulon, and by introducing the division of the day, at all seasons, into twice 12 standardized hours, the importance of this system for defence is obvious.

In 840 Leo was made metropolitan of Thessalonica. Finding the city in the grip of famine due to repeated crop failure,

> He told them not to despair ... And when he recognized through astrology, thanks to the rising and phases of certain stars, that an emanation and sympathy with things earthly were present, he [told them to] place the seed in earth's bosom, resulting in such fertility and fruitfulness that, when spring came and the harvest season arrived, they had enough for several years.

Leo presumably found in his manuscript of Ptolemy what signs in the heavens should precede sowing. No clear distinction was made between astronomy and astrology. Leo's astrology, unlike that of John the Grammarian, has the enthusiastic approval of the chroniclers.

Although probably not an iconoclast, Leo was inevitably removed from the see of Thessalonica in the purge that accompanied the Restoration of Orthodoxy. He reappeared at the time of the foundation of the "University" of the Magnaura by the empress-regent Theodora's brother, Bardas, well after Theophilos's death, perhaps in 855/56. Bardas made Leo head of the philosophy school and possibly of the whole institution. There were three other "faculties" – geometry, astronomy, and "grammar" (in fact language and literature; the incumbent, Cometas, was a great Homer specialist).

Leo produced a "corrected" edition (*diorthosis*) of some of the works of Plato; even though it has not survived, it served Arethas for his "edition", as emerges from a marginal note to *Laws*, 5 (743b): "End of the corrections due to Leo the Philosopher". He quotes Gregory of Nazianzus, and he knew Porphyry as well as Achilles Tatius' romance *Cleitophon and Leucippe* (on which Photios and Leo express differing views). Our limited knowledge of Leo's reading is gleaned from references such as the scholion quoted above to Plato's *Laws* or brief poems by him in the 10th-century *Palatine Anthology*. There are more general references in a curious poem addressed by one Constantine the Sicilian to a "former teacher" of his, called Leo, "who taught profane learning ..., losing his soul in that sea of godlessness"; this is probably our Leo, whom Constantine proceeds to send to "Tartarus and Pyriphlegethon" where he will find all the authors his "heart desires", listing Chrysippus, Socrates, Proclus, Plato, Aristotle, Epicurus, Euclid, Ptolemy, Homer, Hesiod, and Aratus.

A little more is known of Leo's scientific reading. Only one manuscript that belonged to him seems to have come down to us, of Ptolemy's *Almagest* (Biblioteca Apostolica Vaticana gr. 1594, one of the oldest extant minuscule manuscripts), but his verses show that he had Euclid, Apollonius of Perge's *Conic Sections*, treatises on mechanics (now lost) by Kyrinos and Markellos (apparently Latin: Quirinus and Marcellus), on astronomy by Theon of Alexandria, and on geometry by Proclus of Xanthus. The greater part of our text of Archimedes is thought to be due to him.

One sermon that Leo is said to have preached in Thessalonica is preserved; it is decidedly individual. The occasion was, in theory, the Annunciation; the sermon begins, however, with considerations on the names of Easter ("Phasek to the Hebrews ... escape from Egypt, that is darkness – so should 'Egypt' be interpreted") and Pentecost, at considerable length. After various digressions on the properties of numbers and a brief if gushing paragraph on the Virgin, he finally passes to the miraculous healing and conversion of a young Jewess that had taken place in the same church about the year 500; to this he devotes more than half the sermon, giving quite an important role to two icons.

PATRICIA KARLIN-HAYTER

Biography

Born *c.*790, Leo was educated in Constantinople and on Andros. The emperor Theophilos appointed him to a teaching position. From 840 to 843 he was metropolitan of Thessalonica. In 855/56 he became head of the philosophy school at the "University" of the Magnaura. He made important contributions to the textual transmission of Ptolemy, Plato, and Archimedes. He died in Constantinople after 869.

Leonidas *c.*530–480 BC

King of Sparta

Leonidas was famous for his heroic attempt to hold the pass of Thermopylae in central Greece against the advance of the Persians under king Xerxes in 480 BC. His father,

Leonidas: remains of marble statue of Leonidas, hero of Thermopylae, in the Sparta museum. It provided the inspiration for a modern memorial to Leonides and the 300 set up in 1955 at the battle site

Anaxandrides of the Agiad royal house (Sparta had a dual kingship with two royal houses, the Agiads and the Eurypontids), had married his niece but had no children, whereupon the ephors and the council of elders (Gerousia) forced him to take a second wife, who produced a son and successor, Cleomenes I. But shortly after Cleomenes' birth, the first wife, who was hitherto childless, produced three sons: Dorieus, who died in a failed attempt to plant a colony in Sicily, Leonidas, and Cleombrotus. After Cleomenes lost his throne around 490 BC, probably shortly before the battle of Marathon in that year, Leonidas succeeded, having married Cleomenes' only child, Gorgo.

In 480 BC the Persians, whose expeditionary force had been defeated at Marathon ten years earlier, launched a massive invasion: their army, led by Xerxes himself, crossed the Hellespont by pontoon bridges and advanced through northern Greece while the navy, carrying supplies, cruised along the coast. The Greek states that were willing to resist allied themselves under Spartan leadership, and first attempted to make a stand at the vale of Tempe in Thessaly, but the commanders of the joint land and naval force that was dispatched there withdrew once they realized the position was indefensible. A second attempt was made at the pass of Thermopylae, where the road between the Malian Gulf and Mount Kallidromos was much narrower than today. Leonidas was sent there with an allied force totalling perhaps 7,000 foot-soldiers, including 300 elite "Spartiates" of the royal bodyguard, and a comparatively large naval contingent was sent to Artemisium at the northern tip of the island of Euboea to prevent any joint operation between the Persian fleet and the army on land.

However, Leonidas' force was unaware that there was another path bypassing Thermopylae along the ridge of Kallidromos, known locally as the Anopaea. When they learned about it on their arrival, many, particularly those from the region south of the isthmus of Corinth, where the allies from the Peloponnese were building a defensive wall, wanted to withdraw. But Leonidas quelled the panic and assigned the 1,000-strong contingent from Phocis, who knew the terrain, to guard the Anopaea.

For two days the Greeks warded off all Persian efforts to force the pass. But then a traitor, whom the Greeks identified as Ephialtes from neighbouring Malis, offered to lead the Persians along the Anopaea, and Xerxes assigned his elite corps of 10,000 "Immortals" to the manoeuvre. At dawn on the third day Leonidas learned from his scouts that the Persians were circling at his rear by the Anopaea. He sent home the allied contingents from the states to the south of the isthmus of Corinth, while he himself, with his 300 Spartiates, and 700 Thespians and 400 Thebans from north of the isthmus, secured their retreat by remaining behind in the pass and fighting to the death. The Greek fleet at Artemisium, which had engaged the Persian navy timidly while the battle at Thermopylae was taking place, retreated to Salamis off the coast of Attica as soon as it learned of the disaster.

Leonidas' decision to stay and fight was a rational choice made to save the bulk of his army, but he and his brave "Three Hundred" entered mythology almost immediately. Herodotus, who published his *Histories* around 425 BC, reports that Sparta had received an oracle from Delphi that said that either Sparta itself would be destroyed or a Spartan king would perish, and Leonidas, knowing the oracle, chose to save his state by his death. Thermopylae became the chief building block of the Spartan mystique of utter devotion to duty, which was epitomized by the couplet that Sparta engraved on the monument erected where Leonidas' Spartiates made their last stand: "Go, stranger, to the Spartans tell / That here, obeying their commands, we fell." More than half a century later, in 425 BC, when a force that included some 120 elite Spartiates surrendered to the Athenians at the bay of Navarino during the Peloponnesian War, Greece was amazed that they did not die fighting. Leonidas himself became the paradigm of the soldier who obeys orders without question. For the Renaissance, he represented the virtue of Fortitude: at the Collegio del Cambio in Perugia, Perugino depicted the *Four Cardinal Virtues*, each with three examples from history; for Fortitude the examples are Leonidas, Lucius Sicinnius, and Horatius Cocles. For the neoclassicists of the French Revolution, Leonidas represented courageous resistance to tyranny, and a painting of Thermopylae was, among contemporaries at least, one of the most famous works of the "official artist" of the revolution, Jacques Louis David. The Greek War of Independence of the 1820s evoked Leonidas again, along with other heroes of the Classical past; the Souliot leader, Markos Botsaris (died 1823), the defender of Missolonghi who died at the battle of Karpenisi shortly before Lord Byron's arrival in Greece, was called the "modern Leonidas", though the claim to be the modern Spartans belonged to the Maniotes from the southern tip of the Taygetus range. More than a century later, during the German invasion of 1941, his memory was evoked again when the British made an unsuccessful attempt to hold Thermopylae against the German tank divisions. In 1955 a white marble monument surmounted by a heroic bronze sculpture of Leonidas in full hoplite armour was unveiled at Thermopylae by King Paul of Greece. However, the ideal of unquestioning obedience is no longer as attractive to the military mind, and Crane Brinton's judgement on Leonidas' heroism (*A History of Western Morals*, New York, 1959, p. 84) represents a general feeling in the post-World-War-II era: "[it is Thermopylae] much better than the charge of the Light Brigade on which we now surely accept French Marshal Bosquet's verdict, 'C'est magnifique, mais ce n'est pas la guerre'". Brinton goes on to quote a stanza from Tennyson's poem *The Charge of the Light Brigade* as an example of an earlier generation's silliness.

JAMES ALLAN EVANS

See also Persian Wars

Biography

Born *c.*530 BC, Leonidas became king of Sparta after the death of his half-brother Cleomenes in 490. In 480 he attempted to hold the pass of Thermopylae against the Persian army with a hand-picked force of 300 Spartiates and 1100 Boeotians. Their fight to the death immediately entered mythology. His memory has regularly been invoked ever since as the model of resistance to tyranny.

Lesbos

Aegean island

Physical remains and the Homeric poems associate Bronze Age Lesbos with Anatolia and the Troad; despite a tradition of Greek migration two generations after the Trojan War, Greek artifacts are rare before the 10th century BC. After 900 BC Anatolian connections continued in personal names (Myrsilos), cult (Cybele), and material culture, but Lesbos' cities (Antissa, Arisba, Eressos, Methymna, Mytilene, Pyrrha) were inhabited by speakers of a Greek dialect (Aeolic) and no allophone ("Pelasgian") population remained. In the 8th century Aeolian Greeks established settlements on the coasts opposite Lesbos and in the Troad; by 700, except for Assos, they were controlled by Mytilene, and Methymna had enslaved Arisba. Inter-city hostility became a constant of Lesbian history.

Mytilene's dependencies in Asia Minor, outposts in Pontus, Thrace (Aenus), and Egypt (Naucratis), good relations with the Lydian monarchy, and flourishing trade in oil and wine, made Lesbos a major cultural force from 700 to 500 BC. Among their accomplishments were close-fitting polygonal masonry (*Lesbia oikodome*), "Aeolic" capitals with vertical volutes (linking Phoenician models with later Greek orders), and lyric poetry, associated with the cult of Orpheus at Antissa, the home of Terpander (676 BC); Mytilenean hegemony may explain why Terpander and Arion of Methymna worked in mainland Greece. Around 600, Sappho and Alcaeus wrote for and about Mytilene in Lesbian dialect, which was used in inscriptions as late as the 3rd century AD; Lesbian accentuation is maintained in modern place-names (Yéra for Hierá). Besides their poetic influence, Sappho and Alcaeus illustrate much about archaic Lesbian society. Sappho shows how much less restricted women's roles were on Lesbos than in democratic Athens, more like Lydia, where women chose their own husbands; the pejorative use of terms derived from "Lesbos" for sexual behaviours reflects male hostility to such freedom as much as to Sappho's sexuality. Mytilenean politics, as presented by Alcaeus, provided a paradigm of the relationship between aristocracy and tyranny. Mytileneans, with ties to Sardis, may have been the first Greeks to use the Lydian term *tyrannos* for their rulers; it was applied also to the constitutional rule of Pittacus around 590 BC.

After Persian domination the Lesbian cities joined the Delian League in 479, to which Mytilene and Methymna provided ships rather than tribute. In 428 Methymna and Tenedos denounced to Athens Mytilenean plans to unify Lesbos by force; the punishment of Mytilene's subsequent revolt became an eloquent symbol of Athenian imperialism.

In the 4th century Aristotle conducted primary research on Lesbos. In the Hellenistic period Methymna and Eressos were Ptolemaic but Mytilene remained independent. Methymna was an early ally of Rome, but Antissa was destroyed by Rome in 169 BC for supporting Macedonia, and Mytilene, the most persistent supporter of Mithradates of Pontus, was conquered by Rome in 80.

In 62 BC Pompey gave Mytilene back its independence as a favour to his friend, the historian Theophanes. Mytilene developed a special relationship with Rome; several Mytileneans, including the descendants of Theophanes, the sophist Potamon, and the poet Crinagoras, had significant careers in the capital, while important Romans, notably Agrippa and his family, resided in, and were honoured by, Mytilene.

The pastoral novel *Daphnis and Chloe* is part of this relationship. Set on Lesbos by an author with a Roman name, its account of the island's cults had special resonance for descendants of Theophanes, who led a Dionysiac cult near Rome. Longus' assimilation of the pastoral form to that of the love romance and his choice of fertile Lesbos as its setting affected all subsequent pastorals.

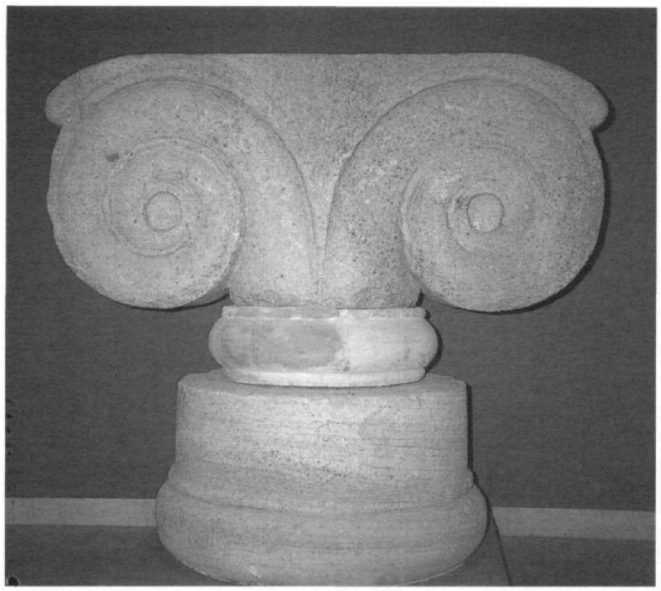
Lesbos prospered in late antiquity. Mosaics from the 4th or 5th century AD portraying scenes from Menander show the continuance of pagan culture, and several Christian basilicas were built in the 5th to 7th centuries.

When the Fourth Crusade took Constantinople in 1204, Lesbos was assigned to the emperor Baldwin, but was recovered in 1229 by the empire of Nicaea. In 1355, Genoese Francesco Gattilusio received it as the dowry of his wife Maria, sister of John V Palaiologos, whom Francesco helped regain the imperial throne. The Gattilusi came to control much of the northeast Aegean, and were more popular with their Greek subjects than other Frankish regimes: their authority came from the emperor, they spoke Greek, brought Greek notables into their council, and maintained the Orthodox hierarchy. Their imperial connections gave Lesbian products (especially wine) preferred access to markets in the capital. Most medieval remains on Lesbos were built by the Gattilusi; their castle in Mytilene reused much ancient material.

When Lesbos was taken by the Turks in 1462, the urban population was transported to Constantinople, and much of the city of Mytilene, in which remains of antiquity were still visible, was destroyed. Many rural communities were abandoned under Turkish rule, and there was substantial migration to the adjoining mainland, where Kydonia (modern Aivali), granted self-government in 1770, became a centre of Greek learning.

In the 18th and 19th centuries the Greek community on Lesbos flourished as they, rather than the Turkish landowners, profited from liberalized trading regulations; wealthy Lesbians built traditional *pyrgoi* (tower houses) in the villages, and fine villas in the southern suburbs of Mytilene. Lesbians participated in the War of Independence, including the destruction of a Turkish warship at Eressos, but remained under Turkish rule until 1912.

Along with Kydonia, Mytilene saw a great advance in learned culture in the 19th century, typified by the philologists Dimitrios and Grigorios Bernardakis. Towards the end of the century Argyris Eftaliotis (1849–1923) became a leading figure in the creation of literary demotic. His portrayal of 19th-



Lesbos: Aeolic capital, late 7th or early 6th century BC, predecessor of the Ionic order

century island life draws on Lesbos' particularly rich folklore tradition, which preserves memories of the Gattilusi, if not of antiquity.

Liberation from Turkey in 1912 and the military catastrophe in Anatolia in 1922 presented Lesbos with a severe challenge to integrate a large refugee population. The response included a movement of political and literary reform with which were associated both Lesbians and refugees. They included the most moving witnesses of Greece's experience of the war years and the Asia Minor catastrophe, Elias Venezis and Stratis Myrivilis, whose idyllic portrait of the island recalls Sappho and Longus. Lesbos' revived culture also supported visual artists, of whom the best known is the folk painter Theophilos Chatzimichail (1873–1934), whose paintings on the walls of buildings on Lesbos are especially fortunate in recalling traditional Greek society, and are symbolic of the role of folk culture in Greek society, to which Lesbos bears particularly eloquent witness.

HUGH J. MASON

Summary

A large island in the northeast Aegean, Lesbos was inhabited by Aeolian Greeks in ancient times. The island was prosperous and an early centre of culture from 700 to 500 BC, making important contributions to music, lyric poetry, and architecture. It prospered again in late antiquity; but under the Turks many communities were abandoned. Prosperity returned in the 18th and 19th centuries and cultural creativity in the 20th.

Libanius AD 314–*c.*393

Teacher of rhetoric

Libanius was born at Antioch, where he belonged to one of the leading curial families. He was the most highly esteemed teacher of rhetoric of his time, and attracted pupils from all over the Near East. Yet he spent most of his life teaching in his native city and died there. Libanius wrote in an elaborate Atticizing Greek that was admired and imitated for most of the Byzantine period. In consequence a large part of his literary output survives: almost 1600 letters, 64 orations on topical questions, 51 declamations, and numerous rhetorical exercises. We therefore know Libanius better than all but a very few individuals of antiquity, and his writings are an almost inexhaustible source of information about social life, politics, administration, entertainments, and education in the 4th century AD; thanks to Libanius, Antioch is by far the best-known provincial city of late antiquity.

Libanius was above all a traditionalist. He was an Atticist in the tradition of the Second Sophistic. His vocabulary, syntax, and sentence structure are based on those of Classical Athenian authors. He was an admirer of Aelius Aristides (AD 117–*c.*189), but he was thoroughly familiar with the Classical authors themselves, above all Homer, Demosthenes, and Thucydides. References and allusions to Plato also occur frequently in his writings. He pays respect to the wisdom of Plato the philosopher, but what he adopted for his own use was Plato's mastery of language. Above all he used him as a source of rhetorical comparisons and analogies. Socrates was a great hero, a kind of pagan Christ. He does not appear to have used Aristotle at all. Unlike his contemporary and admirer the emperor Julian the Apostate, Libanius seems to have had very little use for the philosophy either of the Classical thinkers, or of contemporary Neoplatonists. Declamations with an Athenian setting show that Libanius had a very detailed knowledge of the history, institutions, and customs of classical Athens.

Libanius' writings contain very few allusions to historical events later than the reign of Alexander the Great. Though he

– like most free inhabitants of the empire by the 4th century – was a Roman citizen, and though his life was shaped by decisions of Roman emperors and officials, he showed no interest whatsoever in things Roman, seeing Roman and Latin law as the dangerous rivals of the Greek rhetorical education, based as it was on close familiarity with Classical Greek authors, which it was his life's work to maintain and propagate. In the realms of politics he appreciated the need for an emperor and empire to keep off barbarians and to uphold law and order within the borders, but his personal allegiance was to his birthplace rather than to the empire. More particularly he mistrusted Constantinople as an upstart that was draining human and material resources from cities such as his own Antioch. Libanius was a pagan and made no attempt to hide his paganism. But his Hellenic educational ideal had a strong moral component not very different from the moral teaching of Christianity, and his correspondents included Christians as well as pagans. Libanius was honoured by the Christian emperor Theodosius I. Christian and pagan parents alike sent him their sons to educate. John Chrysostom and Theodore of Mopsuestia were almost certainly his pupils; Basil and Gregory of Nazianzus are likely to have been.

The life and career of Libanius thus illustrate the peaceful coexistence of Christians and pagans in an age better known for religious conflict; and his work as a teacher actively contributed to the assimilation of Hellenic traditions into a Greek Christian civilization.

Biography

Born at Antioch in 314, Libanius was educated in Athens and taught rhetoric at Constantinople and Nicomedia. He declined the offer of a chair of rhetoric at Athens but accepted one at Antioch where he remained for most of his life. His pupils included many famous men. His surviving works includes letters, orations, declamations, and rhetorical exercises. His prose style was much admired by the Byzantines. He died at Antioch *c.*393.

Libraries

Libraries in the ancient Greek world were an important medium for the preservation and storage of literature. Since books had to be copied individually and by hand, many less popular books were fated to survive in the long term only in the collections of one or two libraries or of the occasional enthusiastic bibliophile.

Private book collections began to exist as soon as written literature multiplied, certainly by the 6th century BC. A book trade must have emerged soon after, dealing in second-hand copies. Booksellers may also have provided – speculatively, or to order – new copies of the latest writings: certainly they did this in later periods. At Athens, already in the 5th century BC, a distinct part of the city market was occupied by booksellers. Quite soon two types of libraries emerged to meet the needs that private collections and the book trade were unable to satisfy.

Schools, mainly philosophical and medical, needed to have permanent access to works that were relevant to the teaching and research they conducted, especially texts compiled by their own teachers. By the 4th century BC we know of two such school libraries. The books now known as the Hippocratic Corpus (anonymous medical texts by many authors, traditionally ascribed to Hippocrates himself) were evidently the nucleus of the working library of the Hippocratic school at Cos – broad-mindedly including several works that adopt the theories of the rival school at Cnidus. The contents of the library of the Peripatetic school led by Aristotle, and after him by Theophrastus, also partly survive, in the form of research texts attributed to these two philosophers themselves, though in several cases they are evidently not the actual authors. This library was bequeathed outside the school by Theophrastus, was not available to later Peripatetics, and was nearly lost for good; its history is outlined by Strabo (*Geography*, 13. 1. 54).

True public libraries were needed as soon as the range of texts that people wanted to read grew to the point at which a book dealer could not find or supply them all. If it is true that Pisistratus, tyrant of Athens, established a public library, this need must have been felt as early as the mid-6th century BC. The Latin author Aulus Gellius (*Attic Nights*, 7. 17. 3), the only source of information on Pisistratus' library, adds that it was seized and taken to Persia when Xerxes invaded Greece.

But little is known for certain of libraries before Alexander's time. It was under the Hellenistic kings, with their need to establish and assert Greek culture across the Near East, that major public libraries appeared. The Library at Alexandria (closely associated with the Museum), founded by Ptolemy I Soter (reigned 305–283/82 BC), was one of the great libraries of all time, classified in accordance with a system developed by Aristotle and eventually with a stock of 700,000 papyrus rolls, according to Gellius. Ptolemy persuaded the Athenian state to lend the archive copies of Classic Athenian drama for copying. Having received them, the Alexandrian library kept the old manuscripts and sent new copies back to Athens. The 3rd-century BC poet Callimachus worked at the library and was credited with the authorship of the *Pinakes*, "Tables", which were a thematic listing of Greek writings up to his time and a subject catalogue of the Alexandrian library: sadly, only a few fragments survive.

A second great library of the Hellenistic period was founded under the patronage of the Attalid kings of Pergamum. It had grown to 200,000 volumes when Mark Antony seized it and presented it to Cleopatra. From the excavations of Pergamum some details of the floor plan of this library can be reconstructed: three large rooms, with wooden bookcases, held the manuscripts; a fourth room was apparently for readers' use; and there were colonnades that provided an additional location for reading and discussion. Bookcases for papyrus rolls took the form of sets of pigeon holes: rolls had labels hanging from one end, which could be read without removing the roll from its place.

The Seleucid kings also had an important library at Antioch. Two further Hellenistic libraries, that of the kings of Macedon at Pella and that of Mithradates, king of Pontus, were both taken to Rome as booty by victorious generals. The great library at Alexandria was burned (though not completely destroyed, it is thought) by Julius Caesar's troops in 47 BC. Rome's own public libraries – the first was founded in 39 BC – were probably better stocked with Greek than with Latin literature.

In general, Greek libraries continued to flourish under the Roman empire, and inscriptions and excavations give us occasional clues regarding their operation. They were naturally to be found at centres of Greek learning. The emperor Hadrian founded a magnificent library near the Agora in Athens in AD 131.

Constantinople, the new capital of the Roman empire, eventually became the focus of Greek cultural life. Here it was that Greek literature survived, in libraries and private collections, through medieval times. The emperor Constantius II founded a public library there. Julian added his own book collection to it in AD 362, and it survived until 726.

Byzantine institutional and private libraries suffered in the sack of Constantinople in 1204 and the long period of instability and decline that followed. It is probable that many Classical texts that had survived in Byzantine collections until 1204 were lost for ever in that year. By 1453, when the city fell to the Turks, some of the most important remaining manuscripts had travelled, with fleeing Byzantine scholars, to Italy, and they now enrich the libraries of western Europe.

The chequered history of the libraries of the capital was not shared by the monastic libraries of the Byzantine provinces. Some of these were never destroyed or looted, and, where monasteries have remained active, libraries continue to retain their valuable medieval collections. This is notably the case with several of the monastery libraries of Mount Athos, which date back to the 10th century, and those of Meteora. Also rich is the library of the monastery of St John at Patmos, founded in 1088.

The intellectual climate in Greece in the 16th to 18th centuries, under Turkish rule, did not favour the maintenance or foundation of libraries. In the late 18th century, however, an important landmark was the establishment of schools, several of which were soon equipped with libraries. With very limited funds and absolutely no official support, these naturally collected their stock in a haphazard way, yet the early collections of several of the school libraries (Ioannina, Chios, Dimitsana, Andritsaina, Zagora, and Melies are examples) are now of great importance in the history of the Greek intellectual and political revival.

As Greece became independent and Athens asserted its role as the national capital, the city became the base for scientific and literary societies and for higher education. Thus, in the 19th century, some larger and modern libraries were developed in Athens (occasionally rivalled by Thessalonica).

By the early 20th century the National Library and the Library of Parliament had emerged as the major research libraries in Greece. The National Library, founded at Aegina in 1829, had moved to Athens in 1834 and merged with the Athens University Library in 1842. It did not gain the privilege of legal deposit until 1943. Its collection of early manuscripts and printed books is fairly small, but it is rich in documentation of the struggle for Greek independence. The Library of Parliament was established in 1845, with the privilege of legal deposit and with reliable funding for foreign purchases. It has the best collection of early Greek newspapers and periodicals, and also contains some important collections bequeathed by politicians and scholars.

Other collections of current importance include those of the Academy of Athens, the British, German, and American Schools at Athens, and, more notable than any of these, the privately founded Gennadios Library, which is outstanding in its collections on modern Greek history. It opened in 1921.

Linear B

The oldest surviving written record of the Greek language

Linear B is the name given to the script that records the oldest known form of Greek (dated to the 15th to 13th centuries BC) and therefore is most probably the earliest evidence of the Hellenic people. It was used in the royal palaces of Bronze Age Crete and mainland Greece as a means of recording the transactions of the palace economy and administration until the destruction of the Mycenaean palaces. The first Linear B script,

Linear B: clay tablet showing fragment of writing in Linear B from Knossos, *c.*1450 BC, Ashmolean Museum, Oxford

written on a clay tablet, was found at Knossos in 1878, and this discovery among other things motivated Arthur Evans, a British archaeologist, to carry out a systematic excavation of the site. Evans's excavations at Knossos from 1900 revealed a palace complex older than the palace at Mycenae excavated by Heinrich Schliemann, and it no longer seemed appropriate to label the civilization of Bronze Age Crete "Mycenaean". Evans named the newly found civilization of Crete "Minoan" after the legendary king Minos. He found three distinctive writing systems at the palace which he named Hieroglyphic (or Pictographic), Linear A, and Linear B, according to their physical appearance. Soon Linear B inscriptions were found also at Pylos and other Mycenaean palaces on the mainland, but because they were assumed to be Minoan they were taken to be evidence of Minoan domination of mainland Greece. However, in 1952 Linear B was deciphered by Michael Ventris, a British amateur, and the language was found to be an old form of Greek. The older hieroglyphic and Linear A inscriptions are still undeciphered, but are thought to represent non-Greek languages.

The Linear B inscriptions were either scratched on clay tablets, labels, and sealings, which were subsequently sun-dried, or painted on large clay vessels. Of the clay tablets, some are called "page" type and others "palm-leaf" type, after their respective shapes. The page type can measure up to *c.*24 × 11 cm, whereas the palm-leaf type measures only up to *c.*18 × 4 cm. There is a sort of hierarchical system among the different classes of clay documents. At least some clay sealings appear to have functioned as delivery notes of goods to various administrative centres. Palm-leaf-type tablets recorded shorter entries and page-type longer ones, and some entries on palm-leaf-type tablets were found to be collected and duplicated on page-type tablets. Clay labels were attached to the containers of sets of tablets to function as indexes. In addition, since the surviving tablets refer only to "this year" and "last year" with no reference to earlier years, it is likely that they were only temporary records for the particular year and that longer-term records were kept on some more perishable material. The inscriptions painted on pottery appear to indicate the places of origin or the producers of the content, most probably wine or olive oil. Most Linear B inscriptions come from Knossos (*c.*5600), Pylos (*c.*1200), Thebes (*c.*420), Mycenae (*c.*90), and Tiryns (*c.*80), but a small number of inscriptions have been found also at Chania (tablets and jars), Midea (a sealing), Orchomenus, Gla, Vlicha, Kreusis, Eleusis, Mameloukos Cave, Armenoi, and Mallia (jars).

The clay tablets show the last stage of the script in use, since they were preserved by being baked in the fire that destroyed the palaces which housed them. The dating of the inscriptions is a controversial matter. Those from Knossos are dated to Late Minoan IIIA2 period (*c.*1375 BC), while those from mainland sites are dated to Late Helladic IIIB (*c.*1200 BC). The tablets from Chania in west Crete, however, are dated to Late Minoan IIIB1 (*c.*1275–1250 BC), which brings the Cretan and mainland scribal traditions closer together. The inscribed pottery on the other hand dates from the 15th to 14th centuries BC, which shows that Linear B was invented in the 15th century BC or possibly earlier.

The Linear B script consists of syllabic signs (87), ideograms (*c.*160), and numerals (1 to 10,000). It was derived from Linear A, a script probably devised for a non-Greek language, and is not well suited to the writing of Greek. All the syllabic signs stand for open syllables, i.e. single vowels standing on their own or syllables ending in a vowel, most of which consist of one consonant followed by one vowel. This is not a convenient feature for writing Greek which contains many words with consonant clusters and final consonants. When a syllable comprises v(owel) + c(onsonant) or c + v + c, the consonant which closes the syllable is usually omitted (e.g. *te-me-no* for *temenos*; *ka-ko* for *khalkos*), whereas when a syllable consists of c + c + v, it is usually written out as two syllables, the first containing the vowel of the succeeding syllable as a "dead" vowel (e.g. *ko-no-so* for Knossos). Apart from a small number of special signs such as *ha*, *au*, *dwe*, and *pte*, the script can represent only 5 vowels and 12 consonants (transcribed as *d*, *j*, *k*, *m*, *n*, *p*, *q*, *r*, *s*, *t*, *w*, *z*). This increases the difficulty in representing Greek. For example, the transcriptions *a*, *e*, *i*, *o*, *u* can stand for short, long, aspirated (h-), and unaspirated vowels; the transcriptions *ka*, *ke*, *ki*, *ko*, *ku* can stand for k-, kh-, or g-; *pa*, *pe*, *pi*, *po*, *pu* can stand for p-, ph-, or b-; and l- and r- have the same set of signs in common. The resulting writing is not always clear. What provided the most decisive evidence for the successful decipherment was its occasional practice of adding ideograms, which are often visually recognizable, to the words spelt in syllabic signs, such as "horse" and "tripod". Despite the incomplete nature of the writing, there is sufficient evidence for identifying many dialectal features which show it to be most closely related to the Classical Arcadian and Cypriot dialects.

The contents of the Linear B tablets are mostly lists of people, animals, and goods with short statements, but they do reveal many aspects of palace economy and administration. We can gather from them, for example, the administrative division of the territory, movement of people and livestock, land tenure, offerings to the gods, food rations for workers, production of wool and textiles, production of scented oil, and storage of vessels, utensils, weapons, armour, and chariots. It also appears that the man called *wanax* ("lord"; *anax* in later Greek) was the most powerful person at each palace, and in

the Mycenaean pantheon the most prominent divinity was a goddess (or a group of goddesses) called *Potnia* ("Lady"), surrounded by some familiar names such as Zeus, Hera, Poseidon, and Dionysus as well as others totally unknown. Some tablets from Pylos seem to refer to preparations for an attack expected from the sea, offering an interesting glimpse of the last days of the Mycenaean palaces.

Literacy disappears from most of the Greek world after the demise of Linear B until the introduction of the alphabet in the early part of the first millennium BC. However, a sister script known as Cypro-Minoan, also derived from Linear A, survived in Cyprus, and eventually evolved into the Cypriot Syllabary which remained in use into the Classical period.

Literacy

The earliest known Greek script is Linear B, an adaptation of the Cretan Linear A to accommodate the sounds of Greek, which was devised, perhaps by Minoans rather than by Mycenaeans, at some unknown date (the oldest surviving examples are probably from the late 14th century BC). Although a few Linear B symbols are found on pottery, it seems to have been primarily a secretarial tool for recording palatial inventories of personnel and property on unbaked clay tablets. (There is no scholarly consensus as to whether the "baleful signs" in a folded tablet mentioned in the *Iliad* (6. 168–69) refer to a Greek lexigraphic script, just possibly Linear B, or semasiographic writing or whether they are simply a Near Eastern element imported into the tale of Bellerophon.) Mycenaean society was, therefore, almost exclusively illiterate, a fact which makes more intelligible the Greeks' complete loss of the skill of writing after the collapse of Mycenaean institutions in the 12th century. Knowledge of their past was preserved during the Dark Age (*c.*1200–700 BC) by oral means, most notably in the material that lies behind the Homeric poems.

An alphabet based upon the Phoenicians', but with the adaptation of certain signs to symbolize vowels, was created probably through mercantile contacts and possibly as early as the late 9th century (the earliest known inscription dates from *c.*740 BC). Despite the optimism of many modern scholars, this cannot be proved to have led to widespread literacy throughout the Greek world, even at the most elementary level.

Erection in public places of marble columns inscribed with law codes, first known from the 7th century, did indeed make them available to all, but citizens could rely on intermediaries to read them. Ostracism similarly need not have depended upon common literacy, as the illiterate could have names written for them (a cache has been found of 191 *ostraka* all bearing the name of Themistocles and written in only 14 separate hands). Poetic texts were written down at least as early as the 7th century, but books were always expensive and even in the second half of the 5th century BC Euripides was considered strange for possessing a few papyrus rolls. Schools, though not the only means of transmitting literacy, seem to have arisen first only in the second half of the 6th century (the earliest specifically attested belong to the early years of the 5th) and were never universal. Society remained largely oral, even reading being performed aloud. Although written records of Olympic victors were reputedly made from 776 BC and in the late 6th century Attic demes began to keep records of their members, until at least the 4th century BC legal proceedings were carried out almost exclusively orally, and commercial deals were made by verbal agreements of the parties concerned, the attestation of witnesses, when necessary, being unwritten. There was, moreover, even a distrust of the written word as being more dishonest than the spoken (Isocrates, *Epistles*, 1. 2–3), and Plato, whose inspirational hero Socrates wrote nothing, argues (if *Epistles*, 7 is accepted as genuine) against writing down truly serious things for fear of misuse (344c), and in the *Phaedrus* rightly points out (274e–275b) that literacy militates against memorization.

Although illiteracy seems to have involved no social stigma and created no economic disadvantages even to members of the elite during the Archaic age (*c.*700–479 BC), writing and reading (presumably the more common, especially of lapidary texts) became less unusual accomplishments particularly in the last few decades of the period. They were not confined to the upper classes: inscriptions on vases began as early as the second half of the 8th century and became ubiquitous in the 6th; from 593/92 there survive at Abu Simbel graffiti made by Greek mercenaries; curse tablets first appeared in the 6th century; and even though the earliest known exchange of historical letters in Greek (those of Polycrates of Samos and king Amasis of Egypt) dates only from the 520s, there has been discovered on the island of Berezan, in the estuary of the Bug near Olbia, from only some 20 years later a letter in Milesian Ionic from a private individual (admittedly poorly written, on lead, and probably not even by the sender). Sappho and her circle in late 7th-century Lesbos, though probably exceptional, show that literacy was not exclusively a male preserve. Nevertheless, W.V. Harris concludes that in the Archaic Age "it would be astonishing if as much as 10 per cent of the population as a whole was literate" in any way.

In the Classical period (479–323 BC) there was clearly a great disparity in literacy between city and country, but not necessarily between large and small cities (the minor city of Mycalessus in Boeotia possessed at least three schools in 413, although their type is not mentioned). Most of the known evidence is from Athens, Pericles' "School of Hellas", and thus may be misleading for Greece as a whole. Nevertheless, although Sparta with its need for permanent military preparedness placed little emphasis upon reading and writing, there is evidence that Athens was not atypical (except in its fondness for monumental public inscriptions which need not, however, reflect either a high rate of literacy or democratic policies). Accepting the leadership of the Delian League in 478/77, Athens needed to keep written records (partially surviving) of members' contributions; from 425 are attested both the earliest written manumission and the earliest written litigant's pleading and from about that time, or possibly a little earlier, the first political pamphlet ("The Old Oligarch"); in the last quarter of the century booksellers began to appear; in the last decade a law was passed prohibiting the use of unwritten laws and a state archive was established; by *c.*360 written service and apprenticeship contracts and large loan agreements had appeared and written testimony was required in court; *c.*330 standard texts of the tragedians were placed in the state archives.

During this period literacy for the whole population, including slaves (some of whom were literate), probably reached little more than 10 per cent, but few urban, adult, free males could be expected to be entirely ignorant of letters. The very word *agrammatos* came into existence and signified both "illiterate" and "uncultivated"; Euripides' lost *Theseus* contained a scene whose appreciation was possible only through a knowledge of the shapes of letters of the alphabet; Xenophon in his *Oeconomicus* takes it for granted that not only the landowner Ischomachus but also his wife are literate; Aristotle claims (*Politics*, 1338a15–17) that literacy is useful for "business, running the household, learning and many civic activities".

In the Hellenistic period (323–31 BC) literacy among urban freeborn men reached perhaps 40 per cent. From one area, Egypt, there survive for the first time written ephemera in the form of documents and letters of minor officials and common people, although it is somewhat hazardous to extrapolate from here to the rest of the Greek world. Clearly paperwork (on papyrus) was increasing greatly and was being used for even fairly trivial purposes. However, the many hundreds of documents (at least 1500 from the Hellenistic, Roman and early Byzantine periods) that explicitly mention the illiteracy of one or more of the parties suggest that the majority of male farmers and artisans were unable to write, and that only a very tiny proportion of their wives could. For the elite, however, literacy was now a sine qua non, and institutional libraries, initially probably modelled on Aristotle's at the Lyceum, were established, most notably at Alexandria and Pergamum.

Despite growing bureaucratization and interest in buying books, evident from papyrus finds in Egypt, the percentage of literate Greeks perhaps declined slightly under Roman rule (Harris believes that the peak had been passed by the mid-2nd century BC), as certainly did that of all inhabitants of the Roman empire after *c.*AD 200. It is notable that a village clerk in Egypt was still ineptly practising his signature formula while in office at some point between AD 184 and 187; and that in AD 263 a rich woman considered her literacy sufficiently exceptional to be ground for requesting privileges from the prefect of Egypt.

Although no thorough study has been made of literacy at any period in Byzantine history, it is clear that, even at its lowest ebb in the 8th century, it was always far more common than in the contemporary Latin west. The complex administrative system of the empire necessitated in both the capital and the provinces numerous officials, who depended upon vast numbers of scribes and copyists and whose own literacy is emphasized by the deliberate noting of exceptions (there were reportedly two illiterate emperors, Justin I and Basil I). Many shorthand scribes too were required for taking legal testimony and minutes of church councils and even for recording sermons. Although in the mid-6th century Justinian I found it necessary to legislate that all bishops should be literate, the importance of the Bible and liturgical texts ensured that most ordinary monks (and many nuns) could read (in one document from Athos dated to 991 only three out of 18 monks were unable to sign their names, and it has been estimated that approximately one half of all scribes in the 10th to 11th centuries were monks, although the percentage declined later). Army commanders too were expected to be able to read military manuals. Although the rate of literacy was clearly higher in the cities, and especially in Constantinople, saints' Lives give evidence that many children were able to pick up some knowledge of letters even in remote communities. In the late 9th century Leo VI permitted oral testimony to authorize wills in country areas, but throughout Byzantine history most documents required the signature of witnesses, and Leo's father Basil I decreed that fractions in all tax documents should be written in full so that they should be interpretable by peasants. The cultural elite, which included some women, prided itself on fluency in the "High Language", an approximation of Classical Greek, and scorned as illiterate those familiar only with demotic, the commonly spoken language, or even *koine*, in which the Bible was written.

Evidence for Byzantine libraries is very incomplete and of little aid in assessing general literacy. The huge number of book reviews written by Photios in the 9th century must have required a substantial library or libraries, while letters that mention borrowing as well as inscriptions in surviving manuscripts attest to numerous personal collections after the Iconoclastic period. Monasteries too had libraries ranging from a handful of volumes to a few hundred. In Constantinople itself there were an imperial and a patriarchal library and, at the times when these institutions were in existence, libraries attached to the patriarchal academy and the secular university; but to determine to what extent these collections were accessible to the public is problematic. In the 13th century the emperor Theodore Doukas Laskaris gathered books which were distributed to various cities with the specific instruction that they were to be available to everyone; but this was noted as an innovation. Public access to libraries was not as great during the Byzantine period as it had been during the Hellenistic and particularly Roman eras.

Except among the Phanariots, who often sent their children to be educated in Italy, literacy during the Tourkokratia was

for many years minimal (it was higher among the Greeks in areas ruled by western states). The most educated person in a village was usually the priest who, although he had probably been taught his letters at a nearby monastery, still struggled with his liturgical texts and relied largely on memory. However, growing opposition to the Ottomans and a sense of nationalism promoted the creation of so many unofficial schools that at the time of Greek independence (*c.*1821) at an elementary level Greeks could claim to be one of the more literate nations of Europe; although within a few decades they had been largely overtaken.

The last half of the 20th century saw a great diminution in illiteracy in Greece, and the promise of its almost complete eradication, through more regular attendance and more years of schooling. One minor obstacle to illiteracy, albeit an aid to comprehension, was also eliminated in the last two decades of the 20th century by the gradual abolition of breathings (originally indicating whether or not an initial vowel was aspirated) and the compression into one of the three accents (originally indicating pitch but by the 4th century AD only stress). The abolition of these Alexandrian diacritical signs had been frequently mooted in modern times, but opposition had been such that in the 1940s the University of Athens publicly censured one of its professors for publishing a book without accents.

The first serious attempt to eradicate illiteracy in modern Greece was the establishment by the government of Eleftherios Venizelos in 1929 of night schools to provide elementary education for those above the legal age for primary school. During World War II various resistance organizations attempted to educate especially farmers, and in 1943 an Adult Education Service was developed at the Ministry of Education. Nevertheless, in 1951, after the end of the Civil War, 25.9 per cent of the population aged 15 and over was deemed illiterate (including 49.9 per cent of rural females). Three years later a Central Committee to Combat Illiteracy (KEKA) began to establish night schools at which attendance was compulsory for illiterates and semiliterates up to the age of 20 and voluntary for those older. By 1981 the illiteracy rate had dropped to 9.5 per cent and by 1991 to 4.8 per cent, while of the 389,067 classified in the latter year as illiterate 51.1 per cent were women over the age of 65 (the percentages for Cyprus were higher, but showed a more rapid diminution).

Literacy may be measured also by publication of books, library holdings, and newspaper circulation. In 1995, 4134 new titles were published in Greece, "literature" accounting for the extraordinarily high percentage of 38.6. However, apart from the National Library in Athens and the libraries of higher education, the 669 public libraries housed in 1994 only 9,558,000 books, slightly fewer than one for each inhabitant. This was, to some extent, offset by the fact that 168 daily newspapers had in 1995 a circulation of 153 per thousand of the population, continuing a growing literate trend which had been reversed in most other European countries by dependence on the orality of radio and television.

Liturgy

In Classical Greek the word liturgy (*leitourgia*) referred to any kind of public service. In Christian usage it came to mean the service offered to God by the Christian community, gathered for common prayer. Central to that service is the Eucharist; and in Orthodox tradition the Eucharist is called the (Divine) Liturgy. But liturgical worship includes more than the Eucharist, and here liturgy is used in its wider sense, to include all aspects of corporate Christian worship in the Greek-speaking world.

In common with other Christian traditions, the fully developed pattern of Greek Orthodox worship includes the daily services of the Church – Vespers, Orthros, and the lesser Hours – as well as the sacramental rites of baptism, chrismation (confirmation), the Eucharist, confession, unction, marriage, and ordination. These are called "mysteries" in the Orthodox tradition. In addition there are various rites less often used, such as monastic profession and the consecration of a church, and blessings of various kinds. These services are contained in a number of books. The Euchologion includes the prayers and litanies used by the priest and deacon. The fixed parts of the daily services are in the Horologion. Variable texts for Sundays and weekdays are found in the Oktoechos, those for Lent in the Triodion, for Eastertide in the Pentecostarion, and for the fixed feasts in the 12 Menaia, one for each month of the year. Scriptural readings are set out in two lectionaries, the Apostle and the Gospel. The Typikon gives instructions for celebrating the services throughout the year within the framework of the

liturgical calendar, and combining the texts supplied by these various books. Together, these services and the books that contain them make up what is called the Byzantine rite.

In Orthodox worship the architectural and iconographic setting of services is hardly less important than their liturgical texts. The church building itself is understood to be sacramental. It is heaven on earth, an image of the cosmos. Its interior iconography makes its sacramental significance explicit, and presents in pictorial images the saving events celebrated in the liturgy itself. Traditional interpretation of the symbolism of the church building and its services enables worshippers to enter into the inner meaning of Orthodox worship. In no other rite has there emerged the synthesis of art, architecture, text, ceremonial, and music characteristic of the Byzantine rite, which was essentially complete in its present form by the 15th century.

The origins of this developed pattern of worship are to be sought in the worship of the Jewish community, within which Jesus Christ himself and Christianity were born. Relatively little is known about the development of Christian liturgical worship in the first three centuries. Its setting was domestic: Christians met in private houses, sometimes adapted for the community's use. Only towards the end of the 3rd century were special church buildings occasionally erected. New Christians were admitted by baptism, and then shared regularly in the Sunday Eucharist. There were gatherings for common prayer, reading scripture, and exhortation; and Christians were encouraged to pray at various hours during the day. Easter was the annual celebration of salvation through the death and resurrection of Jesus Christ, Sunday its weekly celebration. The only other elements in the Christian year were commemorations of martyrs. Within a broadly common tradition there was considerable variety of local custom. Some evidence indicates that the Eucharistic prayer was extempore, precluding any standardization.

Significant developments in liturgical worship began in the 4th century. Constantine's recognition of Christianity enabled worship to move into imposing basilicas. Ceremonial developed, as bishops acquired the status of civil magistrates. Liturgical rites came to be written out, and the texts of prayers fixed. Two cycles of festivals emerged: the lunar, centred on Easter, and the solar, centred on Christmas, so giving its basic form to the calendar. Church organization developed, based on the civil administration, and ecclesiastical centres emerged, of which the two oldest were Alexandria and Antioch. Jerusalem rose to rapid prominence after the discovery of the holy sepulchre; and the new capital, Constantinople, soon enjoyed the same prestige as Old Rome. The liturgy of these centres, later called patriarchates, began to acquire distinctive characteristics. Each had its rites of Christian initiation, including baptism, chrismation or confirmation, and participation in the Eucharist, which often took place at the Easter vigil. Each developed its own eucharistic rite, with its own eucharistic prayers, or anaphoras. By the end of the 7th century each of these centres had its own distinctive rite. That of Constantinople is usually known as the Byzantine rite, from the city's original name. These rites gradually spread to other local churches within their sphere of influence, and mutually influenced one another. For the future development of Greek Orthodox worship Constantinople and Jerusalem were of particular importance.

The Church of Jerusalem enjoyed immense prestige. Cyril, bishop of the holy city *c.*349–87, is usually credited with devising the complete sequence of Holy Week observances, which other Churches in the East and West soon borrowed and adapted. The eucharistic theology of Cyril's *Mystagogical Catecheses*, with its emphasis on the transformation of the Eucharistic bread and wine into the body and blood of Christ by the invocation of the Holy Spirit, influenced all Eastern Eucharistic worship. The monasteries of Palestine, especially that of Mar Saba, were to have a profound influence on the development of Orthodox worship. The monks used the same Eucharistic rite as the rest of the Church, but developed their own forms of daily worship, the Hours that made up the divine office. Their content was distinct from that of the cathedral office, which they were destined ultimately to supplant. Much of the liturgical poetry characteristic of the later Byzantine rite was composed, from the 6th century onwards, in Palestine.

Constantinople derived its liturgical tradition from Antioch, but from the end of the 4th century its rite began to acquire distinctive characteristics. The reign of Justinian (527–65) was particularly significant for its development. His new church of Holy Wisdom (Hagia Sophia) completed in 537, was both cathedral and palace chapel. It was the first church building to be given an explicit symbolic meaning as the house of God. Its great dome symbolized heaven, and the church itself was both heaven on earth and an image of the cosmos. Its services were performed with imperial splendour. Its worship, especially the Eucharist, was believed to be a participation in the worship of heaven. This understanding was reflected in liturgical texts, and systematized in the 7th century by Maximos the Confessor, whose *Mystagogia* gives a full interpretation of the church building and of the Eucharist celebrated in it. By the end of the 7th century the rite of Constantinople had acquired its own consistency. This is reflected in the liturgical canons of the Council in Trullo (691–92), and in the first surviving liturgical text from the Great Church. The Codex Barberini 336, from the middle of the 8th century (now in the Biblioteca Apostolica Vaticana), is a Euchologion, containing the prayers of the two Eucharistic rites of St Basil and St John Chrysostom, with those of other services.

The 7th and 8th centuries were highly significant for Orthodox liturgical development. In the early 7th century Alexandria, Antioch, and Jerusalem came under Islamic rule. They had already been weakened by the loss of the majority of Christians in their regions to the non-Chalcedonian Churches. Their influence declined, and their rites came under increasing Byzantine influence. By the 12th century local Eucharistic rites had been almost entirely replaced by those of St Basil and St John Chrysostom. At the end of the century Theodore Balsamon, patriarch of Antioch, held that only the rite of the Great Church should be used by those who considered themselves Orthodox.

The iconoclast controversy (726–75, 814–43) ended with the Triumph of Orthodoxy and the restoration of the icons. It marked the beginning of the domination of the Orthodox Church by monks. The monastery of Stoudios in Constantinople, refounded by Theodore in 799, became an important liturgical centre. Theodore invited monks from Mar

Saba in Palestine to help in the defence of icons and the renewal of monastic life. They brought with them their own daily services, containing a wealth of liturgical poetry, fully orthodox in content. In the monasteries of Constantinople this Palestinian Horologion was combined with the cathedral office of the Great Church. The resulting synthesis was the basis of the final form of the Byzantine daily Hours. The cathedral office continued in use in Hagia Sophia until the Latin conquest (1204–61), when the monks took charge of the services, and in Thessalonica until the 15th century. But the Stoudite office became more and more widely used. At the same time the Holy Week rites of Constantinople and Jerusalem were also exerting a mutual influence on one another, and the final Byzantine Holy Week liturgy was a synthesis of the two rites.

Meanwhile the liturgy of Constantinople continued to develop, and with it the tradition of liturgical interpretation. A century after Maximos, Germanos I, patriarch of Constantinople (715–*c.*733), composed his *Ecclesiastical History*. This liturgical commentary, while not abandoning the understanding of the Eucharist as an image of the worship of heaven, gives greater emphasis to the more historical interpretation first found in Theodore of Mopsuestia in the 4th century. Germanos interprets the Eucharist chiefly as a symbolic representation of the life of Christ. The Little Entrance represents the first appearing of Christ; the Great Entrance represents his passion and burial. The dominance of this more literal interpretation of the Eucharist in the later Byzantine tradition coincided with post-iconoclastic developments in church decoration. From the 9th century the interiors of churches, now usually small, were increasingly covered with iconography in mosaic or fresco. The fully developed scheme depicted heaven and its worship, the saving events in the life of Christ, and the communion of saints. The iconography of the church matched the interpretation of the liturgy celebrated in it.

The liturgical poetry originating in Mar Saba was gradually brought together and arranged for use in liturgical books. From the 8th century the Oktoechos came into being, containing the daily services; from the 10th century the Triodion and Pentecostarion, containing the Lenten and Eastertide texts, and the Menaia, containing the fixed festivals. Rules for combining these texts were given by a series of typika, which begin to appear in the 9th or 10th century. The Stoudite typikon became the most influential, and by the 12th century it had spread throughout the Orthodox world. It was used by the first monasteries on Mount Athos.

The process of cross-fertilization continued. The Stoudite typikon was adopted in Palestine, but also adapted there. This neo-Sabaitic synthesis, as it is sometimes called, influenced the Stoudite rite in the capital. The typikon of Mar Saba gradually ousted the Stoudite typikon, and was adopted on Mount Athos, which, since the Latin occupation of Constantinople, had become the chief monastic centre of Orthodoxy. In the final stage of the development of the Byzantine rite the influence of Athonite usage was paramount. After the triumph of hesychasm in the 14th century, hesychast monks controlled the Byzantine Church. Philotheos, while abbot of the Great Lavra, composed two *Diataxeis*, or books of ceremonial instructions. One contained the rubrics for the divine office, the other those for the Eucharist. When he became patriarch of Constantinople (1353–55, 1364–76), their use spread rapidly. They were incorporated into the first printed texts of the Byzantine liturgical books in the 16th century.

By the fall of Constantinople in 1453, Byzantine Orthodox liturgical worship had reached the form it largely still has today. The church building and its iconographic decoration had also reached their final form. In the 16th century the use of printing made possible the standardization of liturgical texts and usage, which up to then had varied. This fully developed Orthodox rite played an important part in preserving the identity of the Christian peoples of the Ottoman empire. Its wealth of liturgical texts, steeped in Christian doctrine and ascetic teaching, helped to preserve and transmit the Christian faith to succeeding generations when few other means existed.

Livanos, George P. 1926–1997

Shipowner

George P. Livanos was born into a family originating from Kardamyla in Chios, the island that throughout the 20th century was foremost in Greek shipping. In addition to the

willingness to take large risks that is common among Greek shipowners, Chiots are notable for their mastery of the technical aspects of the market and ships alike. Livanos shared all these qualities.

He was born in New Orleans, educated in Greece at Athens College, carried out US military service, and studied engineering at Hofstra University in New York. His professional career was marked by exceptional qualities of innovation. In 1968, against the general trend towards much larger vessels (so as to reduce the cost of transport per ton), he pioneered the "Mini Bulker", a 3000-ton deadweight shallow-draft vessel equally adapted to river and ocean navigation. More than 50 were built. The United Nations used them to move relief cargoes to Bangladesh following the war of 1970–71.

In 1976 Livanos introduced Russian high-speed hydrofoil vessels to the Aegean, thus providing rapid transportation between Piraeus and many Greek islands; by greatly reducing the travel time, this revolutionized the economy of several island regions. In 1985 he entered the specialized chemical transportation field, eventually becoming one of the three largest carriers of chemical products in the world. By the early 1990s he was one of the world's largest shipowners, operating VLCCs (Very Large Crude Carriers) and ULCCs (Ultra Large Crude Carriers) totalling about 3.5 million tons deadweight in a fleet of nearly 100 vessels and almost 5 million tons.

Many shipowners of Kardamyla (from where Livanos's wife, Fotini Carras, also came) were noted for their sense of public service. Both the Livanos and the Carras families had spent much of their first profits from shipping creating their towns' schools. Livanos continued the tradition, painting on a broader canvas. He was personally generous to employees and philanthropic causes alike. He was deeply involved in the interface between American and Greek politics during the 1970s and 1980s. He formed the Hellenic American Alliance in Washington and was himself continuously active in urging on US legislators the importance of a just solution to the Cyprus problem and of maintaining a proper balance in military aid to Greece and Turkey. It is unlikely that this balance would have been maintained during the 1980s without his efforts.

Livanos was committed to the environmental movement. He was a cofounder of *Elliniki Etairia* (the Greek Society), Greece's leading conservation organization, in 1972. Later in his life he was a member of the Council of the World Wildlife Fund (now the World Wide Fund for Nature) and its president in Greece. He was a member of the Club of Rome. His greatest contribution was his foundation in 1982 of HELMEPA (Hellenic Marine Environment Protection Association), a joint effort of the shipping community and the Greek Seamen's Federation to reduce ship-generated pollution. HELMEPA's educational efforts were successful and imitated by CYMEPA (Cyprus), TURMEPA (Turkey), and BRIMEPA (Britain), to all of which HELMEPA contributed valuable knowhow. A man of great ability, extraordinary (almost childlike) enthusiasm, broad generosity, and burning idealism, Livanos made a difference, both to Greece and to the world.

Logic

Logic, the study of valid inference, was developed by Greek philosophers as a result of their interest in arguments of every kind, not only those used in philosophy, but also those used in mathematics, in politics, or in the lawcourts. The first technical term for what we now call "logic" was used by Aristotle, and this was "dialectic"; the first occurrence of the ancient term "logic", meaning the discipline of correct reasoning, is to be found in Aristotle's commentator Alexander of Aphrodisias.

Aristotle is traditionally considered to be the founder of logic. At the end of his *Sophistical Refutations* he himself claimed with some pride to have been the first to conceive of a systematic treatment of correct inference as such and to formulate its rules. But Aristotle was certainly not the first to be concerned with valid reasoning. Before Aristotle philosophers knew how to argue and taught others how to argue; for they were mainly interested in producing arguments to defend their theses or to refute those of their opponents. What is more, already before Aristotle philosophers were aware, and availed themselves, of certain abstract patterns of inference which would ensure the conclusiveness of arguments constructed according to them. Thus it is clear from our sources that already Zeno of Elea in his paradoxes made use of argument patterns like that of the reduction to the impossible. Similarly Plato, in the second part of his dialogue *Parmenides*, obviously inspired by Zeno, constructed an elaborate argument, following a complex formal pattern which explicitly is said to be applicable to any other philosophical subject or discussion. Quite generally, even if Plato might have been averse to the study of reasoning for its own sake, his dialogues present argument systematically set forth in such a way as to make their validity apparent, but also to invite reflection on their validity, rather than simply on the truth of their premisses and conclusions. For instance, given Plato's and his followers' concern with the method of division, one easily sees how one would come to formulate general principles of the kind "if A is a genus of B, and B is a genus of C, then A is a genus of C". But to develop such a body of general principles is not yet to

provide a formal account of valid inference, an account which identifies what precisely it is about an inference which makes it valid.

Aristotle's logical writings were later known under the collective title *Organon*, i.e. an instrument of philosophy, for they were regarded as the works to be studied first, since it is by means of logic that we come to have the knowledge about reality and human behaviour which constitutes philosophy. But not all of the six treatises of the *Organon* deal with logic in the modern sense. The first of these works, namely the *Categories*, classifies the different types of predicates and is often interpreted as a metaphysical or dialectical treatise, rather than as a logical one. Those editors who placed it in the *Organon* thought that it dealt with the terms of propositions of the form "A is B". The *Topics* discusses dialectical arguments of the kind used in the dialectical exercises which formed an important part of the philosophical training in Plato's Academy. The *Sophistical Refutations* is an appendix to the *Topics* and considers logical fallacies. The *Posterior Analytics* investigates the special requirements that scientifically demonstrative arguments have to satisfy beyond being formally valid. Hence, Aristotle's main contributions to the discipline of logic in the modern sense are to be found, first, in his short treatise *On Interpretation*, which presents his theory of the structure of propositions, their truth conditions, and the logical relations between them, in particular their contradictoriness, and their contrariety; and second, in the *Prior Analytics*, in which Aristotle expounds his theory of the syllogism, by considering different kinds of arguments according to their forms.

It is important to note that in his logical writings Aristotle was the first to use letters ("A", "B", "C") to stand in place of the terms of propositions ("white", "animal", "man"). This Aristotelian innovation is regarded by modern logicians as one of the crucial steps in the history of logic, because it implies an awareness of the distinction between logical form and logical matter, and also marks a significant simplification in the representation of the form of arguments. More specifically, in Aristotle's *On Interpretation* four kinds of proposition are distinguished: universal affirmatives, of the form "A holds of every B" (e.g. "white holds of every man"); universal negatives, of the form "A holds of no B" (e.g. "white holds of no man"); particular affirmatives, of the form "A holds of some B" (e.g. "white holds of some man"); and particular negatives, of the form "A does not hold of some B" (e.g. "white does not hold of some man"). A convention going back to the Middle Ages marks each of the four kinds of proposition with a vowel, and thus they may be abbreviated as "AaB", "AeB", "AiB", "AoB", respectively. The universal affirmative is contrary to the universal negative and contradictory to the particular negative, whereas the particular affirmative is contrary to the particular negative and contradictory to the universal negative.

It is next in the *Prior Analytics* that Aristotle presents his theory of the syllogism, by any account one of the greatest achievements in the history of logic. He starts with his standard definition of a syllogism as an argument in which certain things being posited something different from the things posited comes about by necessity, in virtue of the fact that the things posited are so. Hence three distinct propositions are involved in every syllogism, two premisses and a conclusion, and they must be related in the appropriate way to be specified. To begin with, the two premisses must have a term in common, the so-called "middle term", and the two terms of the conclusion, i.e. "the extremes", must each appear in one of the premisses. Thus the three propositions of any syllogism exhibit altogether precisely three terms, and the premisses may, as a pair, show any one of the following structures: (1) A of B, B of C; (2) B of A, B of C; (3) A of B, C of B. These three structures determine the three figures of Aristotelian syllogistic; a syllogism belongs to the first figure if its premisses exhibit structure 1, to the second figure if they exhibit structure 2, and to the third figure if they exhibit structure 3. In later times the various forms in which syllogisms may be constructed within the figures came to be called "moods". Aristotle distinguishes 14 valid moods, which are commonly known by their medieval names. For instance, the first valid mood of the first figure is called Barbara and runs as follows: "A holds of every B; B holds of every C; therefore A holds of every C." A typical Aristotelian example in this mood would then be: "Mortal holds of every animal; animal holds of every man; therefore mortal holds of every man." All the valid moods of the first figure are said to be "perfect", because their valididty is self-evident. The syllogisms in the other figures are "imperfect", but they can become perfect, inasmuch as they can be reduced to first-figure syllogisms whose validity is self-evident. Aristotle employs three methods of perfection or reduction, which means three ways of proving that a given syllogistic form is valid; namely, transformation by conversion, reduction to the impossible, and exposition. In this way Aristotle presents his syllogistic as a system of deductive inference in which the 14 valid moods of the first, second, and third syllogisms can be reduced to the four moods of the first figure; thus these four syllogistic moods constitute the axioms of the system. The axiomatic character of Aristotle's syllogistic bears clear signs of influence by the developments in the mathematical sciences of his time, and its ingenuity and elegance have often been praised even in our times. Aristotle also made a beginning in what we nowadays call modal logic, i.e. the study of propositions containing modal operators like "necessary" or "possible", but his treatment of modal logic in the *Prior Analytics* proves to be unsatisfactory and presumably in the end incoherent.

Some of the Peripatetics followed Aristotle's interest in logic and tried to elaborate further his logical doctrines. Theophrastus, in particular, is said to have been chiefly concerned with the development of certain aspects of Aristotelian logic, but unfortunately none of his logical works has survived. From later authors we learn that he spent some time on an area of logic that was only briefly mentioned by Aristotle, namely syllogisms "from a hypothesis". These are syllogisms whose first premiss at least is a "hypothetical" proposition, i.e. a negated conjunction or a disjunction or a conditional. In the works of Aristotle's commentators the syllogisms with such premisses are called "hypothetical" syllogisms, and are contrasted with the standard Aristotelian syllogisms which are called "categorical" syllogisms. It seems, though, that Theophrastus' account of hypothetical syllogisms never acquired the character of a fully fledged systematic logical theory: that is, a theory of the kind which the Stoics were to produce later on.

In the Hellenistic period, largely independently of Aristotle's term "logic", the logic of propositions, mainly hypothetical syllogistic, as opposed to categorical, was advanced to its highest level. Its beginnings may be traced back to philosophers like Diodorus Cronus and Philo of Megara, who were not only concerned with the study of logical puzzles or paradoxes, like the Liar and the Sorites, but also put forward original theories about the logical modalities and the truth conditions of conditional propositions. But the logic of propositions was finally systematized by the Stoics, who in Chrysippus had a logician of the highest calibre. His numerous works unfortunately are almost entirely lost, and we need to reconstruct Stoic logic from relatively few and not always reliable fragments. Stoic propositional logic was based on the connectives "if ... then" for conditionals, "either ... or" for exclusive disjunctions, "both ... and" for conjunctions, and the prefixed negative "it is not the case that". The Stoics used ordinal numbers ("the first", "the second", "a", "b") to stand in place not of terms but of simple propositions. Their hypothetical syllogistic, like Aristotle's syllogistic, also was developed as an axiomatic system. It was grounded on five types of "indemonstrable" arguments, i.e. elementary syllogisms the validity of which is in no need of demonstration, since it is self-evident, and four rules, the so-called themata, by the use of which all other syllogisms were claimed to be reducible to the indemonstrables. Hence these rules allow one to establish the formal validity of non-indemonstrable arguments by "analysing" them in one or more steps into one or more indemonstrable arguments. The form of the standard five indemonstrables was expressed as follows: (1) "If the first, then the second; but the first; therefore the second." (2) claimed. "If the first, then the second; but not the second; therefore not the first." (3) "Not both the first and the second; but the first; therefore not the second." (4) "Either the first or the second; but the first; therefore not the second." (5) "Either the first or the second; but not the first; therefore the second." A typical Stoic example of the first indemonstrable is: "If it is day, it is light; but it is day; therefore it is light."

The two systems of logic – term logic and the logic of propositions – were considered by the Peripatetics and the Stoics as rivals, rather than as complementary, each supposed to cover all formally valid arguments. In late antiquity, however, we find the attempt to combine the two traditions of the categorical and the hypothetical syllogistic into one logical system. The commentators on Aristotle's logical works, such as Alexander of Aphrodisias, Ammonius, and Philoponus, integrated into their works many Stoic elements, including a doctrine of hypothetical syllogisms. Finally, Galen made a more successful attempt to synthesize the two systems in his *Introduction to Logic*, in which he also deals with relational arguments which are not satisfactorily accounted for either by Aristotle or by the Stoics; that is, arguments like "A is greater than B; B is greater than C; therefore A is greater than C." In general, however, logicians in this period made no substantial logical discoveries, though there are in the writings some terminological innovations. For the most part they stated expansively what Aristotle had stated briefly and elliptically. On the other hand, the logical works of this period preserve historical information, which is invaluable.

The syncretistic tradition of late antiquity was continued with an emphasis on didactic simplicity, first by Byzantine scholars such as Michael Psellos, John Italos, Theodore Prodromos, Leon Magentinos, Manuel Holobolos, Nikephoros Blemmydes, George Pachymeres, John Pediasimos, John Chortasmenos, and George Scholarios, and after the fall of Constantinople by philosophers such as Theophilos Corydaleus, George Koresios, Meletios Syrigos, Gerasimos Vlachos, George Sougdouris, Stephanos Tzigaras, Vikentios Damodos, and Neophytos Doukas. Unfortunately most of the logical writings of these authors have not yet appeared, at least in critical editions, and therefore their study has been seriously neglected.

Longus

Novelist of the 2nd or 3rd century AD

Longus was the author of *Daphnis and Chloe*, a fine but untypical example of the ancient Greek novel, probably dating from the end of the 2nd or beginning of the 3rd century AD. In outline the story follows the romantic stereotype, narrating the love and adventures of its eponymous heroes, culminating in marriage, and even retains some of the common motifs of the genre, such as pirates, shipwreck, and unwanted rivals. *Daphnis and Chloe* is unique, however, in its pastoral setting: although they turn out to be the exposed children of urban aristocrats, its hero and heroine grow up as goatherd and shepherdess in the countryside of Lesbos, of which Longus was possibly a native. Despite its topographical plausibility, however, the setting is not realistic: Longus draws ostentatiously on the pastoral poetry of Theocritus (not least for Daphnis' name) and, probably, of Philetas of Cos, after whom one of the most important secondary characters is named. As befits the Lesbian setting, the poetry of Sappho also provides a number of plot elements, notably in an episode where Daphnis fetches Chloe an apple from the highest branches of a tree. The

urban reader, in effect, is invited to take a holiday in a literary landscape of bucolic fantasy and turn a blind eye to the hardships of real agricultural life.

Elements of travel and adventure of the kind found in other ancient novels are miniaturized and parodied. Raiding pirates take Daphnis only a few hundred metres before their ship is capsized by performing cows; war nearly breaks out between Mytilene and Methymna after a goat gnaws through a makeshift mooring-rope. This lack of physical movement is related to Longus' most profound innovation: his treatment of love, which he presents as a developing and maturing condition. His lovers begin as completely ignorant of Eros, and only gradually become aware of their feelings for one another. They need to be educated in the "name and deeds of love", first by the old herdsman Philetas, who in lyrically elevated prose identifies Eros as the motive power of all creation, and then by a benevolently predatory sex-starved neighbour, Lycaenion, who gives Daphnis a practical tutorial in the woods. Childish fumblings give way to formal courtship and marriage in the city, after the two lovers discover their real identities. The lovers' journey is thus an inner one, from the innocence of rural childhood to the knowledge of socialized maturity. The paradigmatically natural quality of their love is stressed by the way it follows the rhythm of the seasons, awakening in spring, growing in summer, resting in winter, and finding its fulfilment in the second autumn; significantly the novel is in four books. Three myths of metamorphosis, narrated by characters in the story and forming a sequence of increasing violence and sexuality, counterpoint the main narrative in the first three books. Implicitly the fourth and final metamorphosis is Chloe's passage from virgin to wife, and the final myth the novel itself.

A preface presents the novel as an *ekphrasis* ("description") of a painting discovered by the narrator while hunting in Lesbos. It also claims – with a mischievous allusion to Thucydides – a universal applicability for its story. The experiences of Daphnis and Chloe are thus an educative allegory of human love and its place in nature, but the novel is also a self-referential meditation on the nature of literary fiction, which, like the love it depicts, and like a pair of symbolic gardens in the story, is a symbiosis of art and nature, artifice and reality.

Although there is no external evidence to date the novel, its lightly worn erudition and multiple layers of meaning, as well as the artful simplicity of its prose, mark it as a product of the period of the Second Sophistic. The story is set in a timeless Hellenic past, when the two chief cities of Lesbos were independent and war between them was a possibility; there is no attempt to recreate a more precise historical milieu. There is no trace of Rome, but, in its displaced fashion, *Daphnis and Chloe* reflects contemporary concerns with self and sexuality, and, in its ethical but not simplistic confrontation of town and country, echoes a prevalent urban nostalgia for a non-existent bucolic simplicity.

Surprisingly, Longus' exquisite novel does not appear to have enjoyed wide circulation. No papyrus fragments have yet come to light, and the work is not noticed by Byzantine critics, although it is alluded to in the 12th-century verse romance of Evgenianos. In the west *Daphnis and Chloe* has periodically enjoyed a certain vogue, both by virtue of its explicit sexual scenes, and for its literary merits, which were famously commended by Goethe. It is also the only ancient Greek novel to have left a clear trace in modern Greek fiction: Myrivilis's novel *Daskala me ta Chrysa Matia* (*The Schoolmistress with the Golden Eyes*, 1933) features an erotically tinged description of the Lesbian countryside, which evokes *Daphnis and Chloe* for the hero.

Biography

Otherwise unknown, Longus was the author of the novel *Daphnis and Chloe* which may be dated to the late 2nd or early 3rd century AD. The setting suggests that he may have been a native of or visitor to Lesbos. The style places it in the period of the Second Sophistic. The treatment of love as a developing condition is innovative.

Lucian *c.*AD 120–180

Prose writer

Lucian of Samosata was by birth a Syrian rather than a Greek but became one of the most important Greek literary figures of his time. He wrote in an exceptionally pure form of the literary language of the 2nd century AD, an Atticizing Greek almost indistinguishable from that of Plato and very different from the non-literary Greek of his day. This purity of style was essential to his success as an orator and travelling speaker in an age

where enormous importance was attached to the use of correct Greek at all times. (Two of Lucian's works, *The Mistaken Critic* and *A Slip of the Tongue in Greeting*, are elaborate defences of the author after he had been accused of making, in the course of casual speech, linguistic errors that to us would seem utterly trivial.) The quality of Lucian's language was also one of the main reasons for the continued popularity of his works after his death and their influence on later literature.

Most of Lucian's writings are humorous; they were written to entertain rather than to instruct or defend. Perhaps most famous are the satiric dialogues, in which the author mocks insincere philosophers, the rich, and the major figures of classical mythology. Thus for example in *The Downward Journey*, which like many of his works is set in Hades, the author depicts the humiliation of a rich tyrant after his death while also making fun of awe-inspiring mythological figures such as Charon and Clotho. In *Zeus Catechized* he shows Zeus confounded by a human who asks how the power of the gods can be compatible with the existence of preordained destiny, and the same problem is discussed in worried tones among the gods themselves in *Zeus Rants*. In *Philosophers for Sale* various philosophical creeds are auctioned off as slaves, and in the *Fisherman* the founders of the major philosophical schools, returning to life in order to punish Lucian for his attacks on philosophy, discover the vices of their current followers and repudiate them.

These works show that Lucian had an extensive knowledge of Greek literature from Homer onwards and no scruples about parodying it, and they remain extremely funny to anyone with the background to appreciate them. Some parodies are also written in a narrative rather than a dialogue format, such as the *True Story*, the tale of an imaginary voyage with fantastic adventures. Less popular nowadays are the panegyrics and the rhetorical exercises in which Lucian shows his oratorical skill by defending an unlikely or indefensible point; his legal speeches were not intended for actual court proceedings, but for show. Many of the works are set in Classical times or contrast the present unfavourably with those times, and the works that most influenced Lucian (Old and New Comedy, Plato's dialogues, and the lost satires of the 3rd-century BC Cynic Menippus) were all written long before his own time. Thus both in his archaizing language and in his choice of subject matter Lucian reflects the preoccupation of his day with a distant and glorious Greek past, but at the same time he is conscious of rivalling the Classical authors both in language and in wit.

Lucian's works enjoyed immediate popularity that continued into the late antique period, when he was read by figures such as Libanius, Julian, and Alciphron. With the ascendancy of Christianity his status became problematic; his ridicule of the pagan gods and of moral decadence in general was attractive to the Christians, but his *The Passing of Peregrinus*, a biting satire against a charlatan philosopher who had been for a time a Christian, includes some unflattering comments about Christianity and the folly of its practitioners. Although mild compared to the opprobrium Lucian heaped on other groups, these comments drew the ire of many Byzantine Christian writers; thus for example in the influential 10th-century lexicon known as the *Suda* Lucian is identified as "Lucian of Samosata, also called the blasphemer or the slanderer, or rather the atheist" and condemned in the strongest terms. It is significant, however, that Lucian merits a place in the lexicon despite its author's obvious dislike of him, and another large Byzantine manual, Photios's 9th-century *Library*, contains no mention of the anti-Christian material and simply praises Lucian's style and his attacks on immorality and paganism.

In the end, however, it was not Lucian's beliefs but the quality of his writing that ensured his popularity among Byzantine writers. They admired and imitated his language, judging it the equal of Classical Attic (it receives elaborate praise from authors as diverse as Photios and the 12th-century Gregory of Corinth), and they continued to read and laugh at his satires, which some later Byzantine writers (among them Theodoros Prodromos and Manuel Philes) also attempted to imitate. His influence contributed to the development of a genre of satirical dialogues and another of descriptions of imaginary voyages.

Like most Classical authors, Lucian declined in direct influence on the Greek world after the Turkish conquest. This does not however mean that he was forgotten, for the first translation of Lucian into modern Greek was done surprisingly early, *c.*1770, by Constantine Dapontes. In the 18th and 19th centuries Lucian's works enjoyed a renewed popularity, though they continued to cause controversy. At this period the debate about his religious and moral worth was resolved into a solid condemnation from the Church, who associated Lucian with the ideas of the Enlightenment. At the same time, however, his ideas were attractive to many outside the Church establishment, and his style and wit were greatly admired and imitated, even by some religious leaders. In 1806, for example, Michael Perdikaris relied heavily on Lucian in composing a long satiric poem that ridiculed both the leaders of the Enlightenment and those of the Church, and some Church leaders wrote serious defences of piety in Lucian's style. In the late 19th and 20th centuries Lucian's influence once again declined, but it is far from gone; ideas taken from Lucian can be found in a number of 20th-century Greek literary works. Although neither his religious convictions nor his Greek style are now considered major issues, Lucian's works continue to be read and enjoyed today for their sophisticated humour.

ELEANOR DICKEY

Biography

Born at Samosata in Syria around AD 120, Lucian was a prolific and influential writer of Atticizing Greek. Little is known of his life, but he seems to have travelled a good deal and to have spent time in Athens and later in Egypt. Among his writings the satiric dialogues are best known, and his prose style was much admired by the Byzantines. He died around 180.

Lyceum

Site of Aristotle's Peripatetic school in Athens

The Lyceum was one of the main public gymnasia in Athens, named after the sanctuary dedicated to Apollo (Lykeios). In the 5th and 4th centuries BC various Sophists lectured in the Lyceum and Socrates spent time there too. Here Aristotle founded his own school in 336/35 BC. For a long time the exact location of the Lyceum was a matter of speculation. In 1996 the foundations of a large building were discovered in Odos Regillis containing a palaestra which must have belonged to a great gymnasium, plausibly identified as that of the Lyceum. The identification is supported by the date, the use, and the construction of the gymnasium and it corresponds with written sources on the location of the Lyceum.

There is no direct evidence for the motives behind the foundation of Aristotle's school, but it is arguable that Aristotle wanted to influence philosophical education in a way that was not possible in the Academy. Aristotle's school was called "Peripatos" by the members of the school itself. It is more likely that the school was named after the site of the gymnasium than from the activity of walking. Aristotle, unlike Plato, was a metic and thus he could not own property. Theophrastus, Aristotle's successor, though a metic, acquired property with the help of Demetrius of Phaleron. Theophrastus' will (*Diogenes Laertius*, 5. 51–57) is very informative about the architecture and the outlook of the school. The scholarch was the legal owner of the school, which relied on his financial means. The core of the instruction was the scholarch's lectures, but Aristotle also trained his students in dialectic and rhetoric. Aristotle's esoteric works represent to a great extent the lecture material. The Peripatos, like the Academy, did not require adherence to a set of doctrines. Aristotle's views were modified or questioned by early and later Peripatetics alike.

The first generation of Peripatetics is characterized by extraordinary productivity and diversity. Theophrastus became head of the Lyceum when Aristotle left Athens on the death of Alexander the Great in 323 BC. His voluminous works show a clear concern to continue and develop Aristotelian philosophy. It is controversial whether Theophrastus consciously departed from Aristotle's views, but he certainly rejected Aristotle's god, the unmoved mover, although he retained a belief in the divinity of the heavens and the eternity of the world. Theophrastus was preoccupied primarily with natural science but he also showed a keen interest in ethics and rhetoric. He is well known for his *Characters*, and he presumably foreshadowed later developments in Stoic ethics. Important Peripatetics of Theophrastus' generation included Dicaearchus, Aristoxenus, Eudemus, Clearchus of Soli, Phaenias of Eresus, and Chamaeleon. These early Peripatetics showed a strong interest in cultural topics, such as literary criticism (Chamaeleon), rhetoric, and biography (Dicaearchus, Aristoxenus, Phaenias, Clearchus), and their writings were probably used by the Alexandrian scholars a century later. Following Aristotle, they also showed a strong interest in the history of philosophy, logic, and natural science.

The Hellenistic Peripatos was less prominent than its rival philosophical schools. Strato (scholarch 287–269 BC) became known as "the natural philosopher". He rejected Aristotle's theory of place and maintained the existence of the void in the world. Anticipating the Stoics, he made nature and not god the ultimate cause of all phenomena and like earlier Peripatetics (Dicaearchus, Aristoxenus) he maintained the materiality of the soul. Strato's successor Lyco (299–225 BC) is a rather insignificant figure. He tried to revive the school and to attract more students by focusing again on ethical issues, fashionable among the Hellenistic schools. After Lyco the Peripatos declined rapidly and there is no evidence of any serious philosophical activity until the 1st century BC. Hieronymus of Rhodes is better known than Lyco's successor Aristo of Cos for his theory that happiness consists in freedom from pain. Critolaus (2nd century BC) resumed metaphysics; he modified the Aristotelian doctrine of providence, extending it into the sublunary world, while he also claimed that soul and intelligence consist of ether.

In the 1st century BC the Peripatos enjoyed a revival with Andronicus of Rhodes, the acclaimed editor of Aristotle's works. Signs of a recovery were evident before Andronicus. Ariston and Cratippus, both pupils of the Academic Antiochus of Ascalon, abandoned the Academy for the Peripatos. Yet there is no evidence that any of them (including Andronicus) ever became head of the Peripatos. Like the Academy and the Stoa, the Peripatos presumably ceased to exist after the sack of Athens by Sulla in 87/86 BC. Yet the desertion of Aristo and Cratippus makes sense only if some form of Peripatetic school existed. The decline and the revival of the Peripatos are traditionally associated with the fortunes of Aristotle's writings. It has been argued that after Theophrastus the Peripatetics had only Aristotle's exoteric writings at their disposal, whereas his esoteric treatises came to light due to Andronicus' editorial activity. Andronicus received help from the grammarian Tyrranio who provided him with copies of Aristotle's works found in the library of Appelicon which were first moved to Athens and after the sack of the city by Sulla to Rome (*Strabo*, 13. 1. 54; Plutarch, *Sulla*, 4). There Andronicus prepared his edition which included the esoteric works in a certain arrangement and was furnished with commentaries on some treatises and a catalogue. Yet it is not safe to assume that Andronicus was the first to make Aristotle's works available after many centuries or that their present arrangement goes back to him. With Andronicus and his circle (Boethus, Xenarchus) a conscious attempt was made to present Aristotle's philosophy as a system, and to explain real or apparent discrepancies in his writings. From this time on Aristotle's works would be read and commented on by philosophers of all schools, but it was not Andronicus' new edition with triggered this.

There is meagre evidence for any philosophical activity of Peripatetics after Andronicus. Nicolaus of Damascus (64 BC–AD 4) wrote a compendium of Aristotle's teaching. To the 1st century AD presumably belongs the Peripatetic Aristocles of Messene who wrote a long work *On Philosophy* in which he recounts the development of philosophy and criticizes Sceptics, Epicureans, and Cyrenaics. A substantial revival of Aristotelian philosophy took place in the 2nd century AD with Adrastus, Aspasius, and especially with Alexander of Aphrodisias. Both Adrastus and Aspasius wrote a number of commentaries on Aristotle's works. Other Peripatetics of this period include Sosigenes, Herminus, and Alexander of

Mytilene, all of them teachers of Alexander of Aphrodisias. Marcus Aurelius set up chairs of philosophy in AD 176 and the first Peripatetic incumbent was Alexander of Damascus. His successor, Alexander of Aphrodisias, excelled as a commentator on Aristotle and he had a strong impact even among Platonists. Although Alexander's contribution is very significant, especially in logic and metaphysics, no pupils of his are mentioned. After him nothing more is heard of the Peripatetics. With the introduction of Aristotle into the Neoplatonic curriculum, Aristotle was appropriated by the Platonists who now undertook the writing of commentaries. Aristotle's works, especially the *Organon*, now served as an introduction to Platonist philosophy. This change of the Platonists' attitude to Aristotle is to be associated mainly with Porphyry and Iamblichus (3rd–4th centuries AD). Aristotle was seen through Platonist eyes and this version of Aristotle was the one that was inherited by the Middle Ages and the Renaissance.

GEORGE E. KARAMANOLIS

See also Aristotle, Theophrastus

Summary

The Lyceum was a sanctuary of Apollo in Athens, used as a place of teaching by the Sophists. Aristotle founded his school there in 336/35 BC which was known as the Peripatos. When Aristotle left Athens, Theophrastus became head of the school. Late in the 3rd century BC the school declined. In the 1st century BC there was a revival but the school presumably ceased to exist after 86 BC, when Athens was sacked.

Lycia

Region of southwest Asia Minor

The Lycians may have had contact with the Greek world in the Bronze Age, to judge from scattered archaeological remains. Contact had been re-established by the 8th century BC, when the Lycians borrowed their alphabet from the Rhodian Greeks. In the east of Lycia in the 7th century BC there was a strong Rhodian presence, including the cities of Rhodiapolis, Corydalla, Gagae, and Phaselis, though only Phaselis maintained a distinct Greek character through the Classical period.

In mythology and cult Lycia was early associated with Apollo, who had an epithet Lykeios, and was sometimes said to have been born there; an oracular site is known as early as Herodotus (1. 182). Lycia also formed the setting for Bellerophon's encounter with the Chimaera. The Lycian heroes Sarpedon and Glaucus are highly prominent in the *Iliad*, with Sarpedon second only to Hector himself on the Trojan side; one of the classic expositions of the code of the Homeric hero is placed into Sarpedon's mouth, in discussion with Glaucus (*Iliad*, 12. 307–30).

Because of Lycia's important position on the naval route from the eastern Mediterranean to the Aegean, it was strategically of great value, and was often disputed in the struggles between Greek hegemonies and Persia, and then those between the Hellenistic states (and eventually Rome). Alexander the Great invaded Lycia to deny naval bases to Persia, and Ptolemaic Egypt felt it important to maintain control over the area in the 3rd century BC.

Lycia was ruled by a semifeudal aristocratic monarchy, with a number of quasi-independent dynasts being attested (claims that it had a "federal" constitution before the Hellenistic period are unfounded). This system, under Hellenic influence, culminated in individuals such as Pericles of Limyra (*c.*380–370 BC), who displayed some of the aspects of personal rule later seen in Mausolus of Caria and the successors to Alexander.

From the 6th century BC the Lycians were commissioning Greek (or Greek-trained) artists to produce sculpture for them, though often applying Greek styles to native or oriental themes (note the frequency of the oriental audience scene, e.g. on the "Harpy Tomb" at Xanthus); such commissions may have contributed to the further spread of Greek artistic traditions.

By the end of the 5th century the Lycians had begun to use the Greek language in inscriptions; in the 4th century some Lycians adopted Greek names. The process of Hellenization continued through the following centuries (including some Greek settlement, but to a degree which is difficult to judge), until it reached the point where Cicero could speak of them as "a Greek people" (*In Verrem*, 4. 10. 21). Nevertheless, aspects of Lycian society can be seen feeding into the main Hellenic tradition. The Lycians were pioneers in the use of portraits of living individuals on coinage (in the late 5th century BC), and their blend of Hellenic and oriental influences in their art and architecture can be seen as a microcosm of the Hellenistic world that followed. In particular, early 4th-century Lycian podium tombs with facades imitating Greek temples, such as the "Nereid Monument" at Xanthus and the Heroön of Pericles at Limyra, influenced the Mausoleum of Halicarnassus and ultimately funerary architecture throughout the Hellenistic world.

Several Greek writers are known to have been native Lycians. Leaving aside the semimythical poet Olen, sometimes supposed to be from Xanthus, there was the 4th-century BC historian/mythographer Menecrates of Xanthus, the 3rd-century BC writer Mnaseas, and the 5th/6th-century AD geographer/historian Capiton of Lycia. Theodectus, a 5th-century BC tragic poet, came from Phaselis, and the late Epicurean philosopher Diogenes (2nd century AD?) was from Oenoanda in north Lycia, where he left a massive inscription detailing his philosophy. Only fragments survive of most of these authors' works, and the same is true of the numerous *Lykiaka* (works on Lycia) written by non-Lycian writers.

After *c.*200 BC a federal league appeared in Lycia, which was a significant force in eastern Mediterranean politics until Lycia became a Roman province in AD 43, and even after that continued to provide an administrative framework for the region. With the coming of the *pax Romana* Lycia became a quiet backwater, occasionally visited by Roman emperors and high officials (Augustus' heir Gaius Caesar died there in AD 2), which was slipping into economic decline by the 3rd century AD. Lycia did, however, make one contribution to the development of Christianity and the Greek Orthodox Church: St Nicholas was born in the Lycian city of Patara, and was bishop of the neighbouring city of Myra. After the Arab invasions of the 7th century AD and the abandonment of the cities Lycia largely ceased to be part of the Greek world, though the island of Megiste, off the Lycian coast, continues to be a Greek settlement and part of Greece.

In 1838 the English dilettante Charles Fellows arrived in Lycia, in search of Greek antiquities. In the course of a number of subsequent visits up to 1844, he explored most of the cities of Lycia, and supervised the removal of a number of antiquities to the British Museum in London, where they remain the responsibility of the Department of Greek and Roman Antiquities. The popular success of Fellows's expeditions contributed to further exploration of the Greek heritage of Anatolia.

ANTONY G. KEEN

Summary

The people of Lycia in southwest Asia Minor were using the Greek alphabet by the 8th century BC. The region was of strategic importance for its position on the sea route to the eastern Mediterranean. Greek artists were employed from the 6th century. Lycians were among the first to use portraits on coinage. Lycia became a Roman province in AD 43 and reverted to obscurity, before falling under Arab influence in the 7th century.

Lycophron

Hellenistic poet

Lycophron's claim on our attention rests on a single text, the *Alexandra*, formally a hypertrophic messenger's speech, a dramatic monologue of over 1400 lines reporting the prophecy of the Trojan War and its aftermath delivered by Cassandra (here Alexandra) when Paris set out for Sparta. Its erudite and lively-minded author is usually identified as Lycophron of Chalcis, the contemporary of Callimachus who organized the texts of comedy for the Alexandrian library under Ptolemy II (282–246 BC) and composed not only numerous tragedies (of which merely one fragment and 20 titles survive), but also a satyr play with a contemporary subject, his teacher Menedemus of Eretria (see Snell, *Tragicorum Graecorum Fragmenta*, vol. 1, no. 100). The traditional attribution has been questioned because the poem's references to a widely acknowledged Roman supremacy (1226–80 and, probably, 1446–50) appear incompatible with a date in the first half of the 3rd century BC, and some have therefore argued for composition in the early 2nd century BC, whether pseudepigraphically or by a younger poet of the same name; but it is more likely that these passages are later interpolations (see below).

The poem presents the matter of Troy from the Trojan standpoint; Cassandra's peculiar perspective is crucially important. Greek achievement is persistently denigrated, Greek

misfortune stressed. Relatively little space (31–386) is devoted to the war itself and to Troy's downfall; here Cassandra concentrates on what concerns her family and herself, culminating with the horror of Ajax' assault when she had taken sanctuary in Athena's temple. In expiation for his act of sacrilege the Greek host undergoes manifold suffering both on the journey home (387–1089) and thereafter (1090–1282); in Locris, Ajax' homeland, his people will pay the penalty for 1000 years (the Locrian maiden tribute). Cassandra's vision then extends to further conflict between Asia and Europe, the Persian Wars, and the victories of Alexander the Great, concluding with the triumphs by land and sea of her (not easily identifiable) kinsman (1283–1450). With immense ingenuity Lycophron works into this framework episodes from other cycles of legend (such as the Argonautica), basic to the Greek cultural identity of his day. Interwoven with relatively familiar narratives, often given a new slant by the narrator's non-Hellenic standpoint, is material relating to the western Mediterranean, the foundation legends of Greek colonies, and strange tales inspired by the attempt to accommodate various native peoples within the Greek ethnographic framework. Wide reading and a magpie mind have resulted in a masterpiece of intertextual virtuosity, rich in colourful and curious detail. A narrative covering more than 1000 years is unified by the Aeschylean and Herodotean theme of the rivalry between Asia and Europe, an immensely grand conception matched by Lycophron's elevated, somewhat Aeschylean style.

The obscurity of Lycophron's manner of expression is often exaggerated, but certainly he must have envisaged erudite readers prepared to spend time in working out oracular conundrums; the modern reader is seriously handicapped by the loss of much literature which Lycophron could assume to be generally familiar to the educated. In any case, long-standing Indo-European tradition favoured a degree of inaccessibility in prophecy, where the presence of obstacles between the message and its recipient required the latter to exert himself, so that he would be the more likely to value the guidance offered at its proper worth.

Virgil evidently read the *Alexandra* with appreciation; it provided the most obvious model for the extensive use of prophecy to bridge the gap between the heroic age and the poet's own day, and for a narrative of Troy's fall presented from the standpoint of the defeated (though Aeneas' perspective is somewhat different from Cassandra's). To the same period belongs the commentary by Theon of Alexandria from which our scholia derive; without this guidance very much would be unintelligible to us. Though Lycophron does not figure among the authors recommended by Quintilian to aspirant orators, Statius' schoolmaster father apparently included him along with Callimachus in his syllabus (*Silvae*, 5. 3. 156f.); he is similarly mentioned as a school author, along with Callimachus and Euphorion, by Clement of Alexandria (*Stromateis*, 5. 50. 3). This difficult, allusive poetry did not lack readers in provincial towns; from Roman Egypt we have papyri representing three separate copies (P.Oxy. 2094+3445, 2nd century AD; P.Oxy. 3446, 2nd century AD; P.Mon. 156, 1st–2nd century AD).

The poem's popularity in the Byzantine period, no doubt at least as much due to its wealth of mythological learning as to its literary qualities, is indicated by the proliferation of manuscripts; the Pontifical Institute of Mediaeval Studies in Toronto has produced a list of nearly 150 (see Robert E. Sinkewicz, *Manuscript Listings for the Authors of Classical and Late Antiquity*, microfiche 4, Toronto: Pontifical Institute of Medieval Studies, 1990). It was regular reading in Byzantine schools; Gregory of Corinth recommended the clearer passages of Lycophron (along with Sophocles) as models in the composition of iambics. Eustathios refers to him more than to any other poet apart from Homer, on occasion quoting him without name, his habit only with works that he knew very well (see further M. van der Valk, *Eustathii Archiepiscopi Thessalonicensis Commentarii ad Homeri Iliadem Pertinentes*, vol. 1, Leiden: Brill, 1971, p. LXXXV); it is highly probable that he contemplated composing a commentary on the *Alexandra*.

Lycophron's stock stood very high in the 16th century; nine editions of the *Alexandra* had been published by 1600, and the poem was esteemed by the Pléiade, the erudite circle to which Ronsard belonged. A steep decline in its standing set in at the beginning of the 19th century, with the invention of the Lycophron Question, which turns on the poem's references to Rome's supremacy. Cassandra's prediction of the manifold tribulations in store for the Greeks concludes with a lengthy passage on the future fame of Aeneas' line settled in Italy (1226–80), an unqualified encomium of the rising power of Rome which in the first half of the 3rd century BC might be thought to indicate authentic prescience. Little attention was paid to this problem until it attracted notice from B.G. Niebuhr and, independently, the Whig politician Charles James Fox. Niebuhr postulated a later Lycophron, writing in the early 2nd century BC after the Roman conquest of Greece; Fox diagnosed interpolation. A further passage is affected; Cassandra's prophecy culminates (1446–50) in the victories of a kinsman of hers, some time after Alexander the Great, "a unique wrestler" who will triumph by land and sea. There is too much detail for this to be taken as an unspecific hope for the future; but the identity of the conquering hero is highly controversial, though there seems currently to be general agreement that he must be a Roman, and probably Titus Quinctius Flamininus, the victor of Cynoscephalae (197 BC), enjoys the strongest support. The surprisingly brief treatment of Alexander's achievements (1439–45) rather suggests that a process of updating led to some curtailment of the original culmination of Cassandra's prophecy; we should expect her to display more interest in the decisive role to be played by a second Alexander in the intercontinental feud initiated by her brother. Thus, though the *Alexandra* is permeated by a sense of historical development over a millennium and creates the expectation of a political or ideological message, we are frustrated by the problem of identifying the figure on whom Cassandra has set her hopes.

STEPHANIE WEST

Biography

Traditionally identified with Lycophron of Chalcis, tragedian and contemporary of Callimachus (early 3rd century BC, but some prefer a 2nd-century date). He was the author of one surviving poem, entitled *Alexandra*. It reports the prophecy of Cassandra relating to the Trojan War and its aftermath.

Lysander

Spartan general of the 5th century BC

A member of a noble family that claimed descent from the founding heroes, the sons of Heracles, Lysander first appears in the sources when appointed to command the Spartan fleet in the east Aegean in 407 BC. The Spartans' prospects had declined since the renewal of the naval war in 412 BC after the disastrous failure of the Athenians' expedition to Sicily. Then, with the Athenians' allies beginning to secede and the Persians contemplating intervention against Athens, the Spartans reacted vigorously by sending a fleet to the west coast of Asia Minor. The Athenians, however, had proved resilient, despite internal dissension, while Spartan admirals were ineffective and failed to establish good relations with the Persian satraps, who supplied some money but failed to commit themselves. In late 411 and 410 BC the Athenians, inspired by Alcibiades, who had returned from exile to join their fleet, had won two victories, the second off Cyzicus leading to the destruction of a Spartan fleet of 60 ships. They had gone on recovering lost allies and by June 407 BC, when Alcibiades made a triumphant return to Athens, were looking to complete the restoration of their old naval dominance.

On taking up his command, Lysander was fortunate in that a Spartan embassy had just returned from Susa, having secured the Persian king's agreement to renew support for Sparta and his appointment of his younger son, Cyrus, to take charge of the three western satrapies and of the implementation of the agreement. Lysander at once established good relations with Cyrus, whose support enabled him to refit and strengthen the fleet he took over at Ephesus. By late August it numbered 90 ships. With these he was able to take advantage of Alcibiades' temporary absence at Phocaea and of the inexperience of his deputy to destroy 22 of his 100 ships, a victory that led to the removal from his command of Alcibiades, who never returned to Athens.
